HOLLOWAY'S OINTMENT AND PILLS HAVE SUCCESSFULLY CURED ULCEROUS WOUNDS AND DREADFULLY SWOLLEN LIMBS.—Extract of a letter addressed to Messrs. Barnett Brothers, Wholesale Agents for HOLLOWAY'S Pills and Ointment, Surinam:—"Gentlemen,—I beg to inform you that I considered my son lost to society in consequence of swollen limbs and ulcerous sores, with which he was severely afflicted. I have sacrificed large sums of money to doctors, who have afterwards told me that it was a hopeless case; but at last I tried HOLLOWAY'S Pills, and the result has been so favourable that it has astonished all who had seen the deplorable state my son was in.—Signed JOSEPH MACHIELSE."—Sold by all Druggists; and at Professor HOLLOWAY'S Establishment, 244, Strand, London.

# HORTICULTURAL BUILDING AND HEATING BY HOT-WATER,

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.

## GRAY AND ORMSON, DANVERS STREET, CHELSEA, LONDON,

Having had considerable experience in the construction of Horticultural Erections, which for elegance of design, good materials and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are now in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-Water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot-Water can be made available.

NEW WORK BY ALBERT SMITH AND JOHN LEECH.

NORFOLK AND NORWICH HORTICULTURAL SOCIETY.—A Grand DAHLIA EXHIBITION will be held at St. Andrew's Hall, Norwich, on WEDNESDAY, the 17th September, 1851, open to Amateurs, being members, and Nurserymen, in all England. Prize List, and every information, on application to WILLIAM HUSSEY, Secretary.
Horticultural Gardens, Norwich, Sept. 6.

VALE OF TAUNTON DEANE HORTICULTURAL AND FLORICULTURAL SOCIETY.
The next EXHIBITION of this SOCIETY will be held in the VIVARY PARK, TAUNTON, under their splendid MARQUEE, on WEDNESDAY, the 17TH of SEPTEMBER next.
The Society offers a handsome SILVER CUP to be competed for by Nurserymen (open to All England), for the best stand of DAHLIAS, 24 dissimilar blooms.
Competitors for this Prize will be required to pay an entrance fee of 2*s.* 6*d.*, and give four days' notice of their intention to exhibit, to the Hon. Secretary, Mr. J. KINGSBURY, Canon-street Cottage, Taunton.—September 6.

SCOTTISH GARDENERS' AND LAND-STEWARDS' ASSOCIATION.—At a Meeting for the ELECTION OF THREE PENSIONERS on the general Funds of the Association, held at the Chambers, No. 6, York-place, Edinburgh, on the 28th inst., the following was the state of the Poll at the close of the ballot:—

JOHN COWAN (Kilninver, Argyll), aged 77 ... ... 184 Votes.
ALEX. THOMSON (Aberdalgie, Perthshire), aged 68... 173 ,,
JOSEPH MACKIE (Dailly, Ayrshire), aged 74 ... ... 111 ,,
DONALD SMITH (Kilmodan, Argyll), aged 66 ... ... 81 ,,
DUNCAN M'DOUGALL (Muthill, Perthshire), aged 68 49 ,,

The three candidates, Cowan, Thomson, and Mackie, having the greatest number of Votes, were thereupon declared duly elected. ARCH. SCOTT, Chairman.
Edinburgh, Sept. 6.

MESSRS. JEYES AND CO.'S Collection of CINERARIAS during the last spring was acknowledged by all parties who saw it to be the finest they had ever seen.
Seedlings from the above will be sent by post, secured in tin boxes, at the rate of 2*s.* 6*d.* per dozen. Payments can be made in postage stamps.—Nurseries, Northampton.

JOHN AND CHARLES LEE'S Catalogue of STOVE and GREENHOUSE PLANTS is just published, and may be had post free on application, enclosing two postage stamps.
Nursery, Hammersmith.

DUTCH FLOWER ROOTS.—The Undersigned have great pleasure in announcing to their patrons and the public, that their annual importation of the above has just arrived in excellent condition. The roots are of the best quality, and will be sold at as reasonable prices as by any respectable house in London. Catalogues may be had on application.
Clapton Nursery, London, Sept. 6. HUGH LOW and Co.

WINTER CUCUMBER—"LORD KEYNON'S FAVOURITE."—Numerous inquiries, within the last few days, for the above CUCUMBER SEED having been made, EDWARD TILEY begs to inform his Customers that he has some good old Seed of this variety, which surpasses all others for winter cultivation. Sold in packets, at 2*s* 6*d.* each; or sent post free on receipt of 30 penny postage stamps.
EDWARD TILEY, Nurseryman and Seedsman, 14, Abbey Church-yard, Bath, Somersetshire.

GOLIATH STRAWBERRY.—A Post-office order for 5*s.* will secure (package free) 100 strong plants of this celebrated Strawberry, or 12 plants, free by post, on receipt of 18 postage stamps. Also TROLLOP'S VICTORIA, 4*l.* per 100, and any of the old varieties at very low prices. The usual allowance to the trade.—JAS. KITLEY, Lyncomb Vale Nursery, Bath.

LOCKSBROOK NURSERY, BATH.
R. SHACKELL respectfully informs the public that he has an extensive variety of SINGLE ANEMONE ROOTS, of last year's Seedlings. The flowers are rich in colour; and for those who desire their gardens to be of brilliant bloom in winter, none can be more suitable, as young roots always are in flower much earlier than the old ones. If these roots be planted now, they will be sufficiently grown to take them up with earth attached to the roots, to fill the vacancies of the flower borders.
R. S. has also a large supply of PANSY SEED, saved from a collection of flowers that has obtained universal admiration. If these be sown this present autumn, in a rich soil, they will be fit to remove to supply vacancies in the flower borders at the same time as the ANEMONES.
R. S. confidently recommends both of the above, and is quite sure that none who try them will be disappointed. Terms:—

ANEMONE ROOTS, 5 dozen ... ... ... 2*s.* 0*d.*
PANSY SEED, per packet ... ... ... 1*s.* 0*d.*
(These will be sent by post free.)
SINGLE ANEMONE ROOTS, per lb. ... ... 2*s.* 6*d.*

Also an abundance of DELPHINIUM BARLOWI and GRANDIFLORUM ROOTS at 6*s.* per dozen. The autumn is the time for planting these beautiful varieties, and the earlier the better.—Address, R. SHACKELL, Florist, 36, Broad-street (opposite the Post-office), Bath.

MUSHROOM SPAWN.
JAMES MAY begs to inform the trade and public that he has at this time now ready a large quantity of first-rate quality, the price of which may be had on application. Highly respectable reference can be given if required.
Munster Farm, Fulham, London, Sept. 6.

FOREST PLANTS IN THE GREAT EXHIBITION.—The Subscribers beg to direct the notice of Planters to their specimens of Forest Plants exhibited in Class IV., No. 1, South-west Gallery, among which are Seedling and Transplanted native Scotch Pines, raised with roots unusually fibrous, adapted for exposed Moorland at a great altitude. The numerous premiums awarded by the Highland and Agricultural Society of Scotland for the cultivation of the true native Scotch Pine, have been awarded to the Subscribers; and their present Stock of this valuable Tree exceeds Ten Millions of Plants. Priced Lists will be furnished on application, and the Trade supplied at the wholesale rate.
JOHN GRIGOR and Co., Nurseries, Forres, Scotland.

CAMELLIAS.
W. LYNN'S (FLORIST) entire Stock of CAMELLIAS will be disposed of by private contract, consisting of about 185 Camellias, from 1½ to 4 feet high, many of them well set for bloom and in good condition, and about 200 Camellia Stocks. These Camellias are part of the original stock of the late Mr. Smith, of Dalston. If not disposed of by private contract, it is W. L.'s intention to sell them at the Mart, of which notice will be given.—For further particulars apply, if by letter, prepaid, to W. LYNN, Florist, Wells-street, Camberwell, Surrey.

JUDSON'S RICHMOND VILLA BLACK HAMBURGH VINE.
JOHN ANDREW HENDERSON AND CO. have the pleasure of informing their patrons and friends that they are now sending out this very excellent new Grape at 21*s.* each.
Its distinguishing characteristics are as follows:—The foliage is more deeply serrated, and the wood shorter jointed than the Black Hamburgh; the berries are oval, and rather elongated, and are remarkable for a very fine bloom, not unlike that of an Orlean Plum; when fully ripe are a fine deep black, having a fine rich flavour, and very juicy.
It colours full ten days earlier than the Black Hamburgh; being a most abundant bearer, and good setter, will prove a most desirable kind for pot-culture. One very remarkable property this Grape possesses, which much enhances its value, and makes it so superior to the Black Hamburgh is, that it never produces abortive, or, as they are termed, vinegar berries; after careful observation, extending over three successive seasons, not one could be detected, although in each season the crop was abundant and good. The usual allowance to the Trade.—Pine Apple Place, Edgeware Road, London.

MYATT'S NEW SEEDLING STRAWBERRY, "CINQUEFOLIA"—The character of this Strawberry is quite distinct, having generally five leaves on each foot-stalk. The trusses are strong, producing an abundance of large fruit of a fine flavour. For general description, see *Gardeners' Chronicle*, of July 12th, and "Gardeners' Journal," of July 19 h. Plants of this variety 50*s.* per 100; also Myatt's Surprise, 21*s.*; British Queen, Eleanor, Globe, Deptford Pine, Mammoth, Eliza, Fertilised Hautbois, Hooper's Seedling, Keen's Seedling, Swainstone Seedling, Elton Pine, Black Prince, Bicton Pine (white), 3*s.* 6*d.* per 100. Kitley's Goliah, 5*s.*; Jackson's Britannia, 5*s*—Post-office orders are requested to be made payable to JOSEPH MYATT, Manor Farm, Deptford, Kent.—Sept. 6.

DUTCH FLOWER ROOTS.
WILLIAM E. RENDLE, Plymouth, NURSERYMAN and FLORIST by royal permission, to HER MOST GRACIOUS MAJESTY THE QUEEN, has much pleasure in announcing that he has just received a large collection of DUTCH FLOWER ROOTS, in most excellent condition, from one of the first establishments in Holland. The HYACINTHS are particularly large and handsome.—Descriptive Catalogues can be obtained, for two penny stamps, on application to WILLIAM E. RENDLE, Nurseryman, Plymouth.

HOSEA WATERER'S Descriptive Catalogue of AMERICAN PLANTS, CONIFERS, ROSES, &c., for the ensuing Autumn, is just published, and may be had on application, enclosing two postage stamps, to Mr. HOSEA WATERER, Knap Hill Nursery, Woking, Surrey.

STIRLING CASTLE PINE STRAWBERRY.—The Subscriber begs to intimate that this variety, sent out by him last spring, has fully sustained the character then given as to its superior size, productiveness, and flavour. In support of this he is prepared to furnish the testimony of numerous gentlemen, gardeners, and nurserymen, whom he furnished with plants. Healthy plants may now be had at the reduced price of 5*s.* per 100, or, free by post, 1*s.* per doz.
Edgebill Nursery, Dean, Edinburgh. ROBERT M. STARK.
Agents in London, Messrs. Hurst and M'Mullen, 6, Leadenhall-street.
R. S. has received, in good condition, his annual supply of imported DUTCH BULBS, of which, with a selection of New and Interesting Plants, Florists' Flowers, &c., a list may be had on application.

BASS AND BROWN'S AUTUMN CATALOGUE is now ready, containing—
PART I. The New Geraniums, Fuchsias, Petunias, Verbenas, and other new and select Plants, at reduced prices.
PART II. Roses, select Evergreen and Flowering Shrubs, Climbers, Hardy Herbaceous Plants, &c.
PART III. Flower Roots, embracing splendid collections of Ranunculi, Gladioli, Early and Late Tulips, Iris, Lilies, imported Dutch Hyacinths, &c., &c.
Copies supplied on application, published complete with the newspaper stamp, to go free.
Seed and Horticultural Establishment, Sudbury, Suffolk.

SAFFRON WALDEN.—SUPERB DOUBLE HOLLYHOCKS.
WILLIAM CHATER begs respectfully to inform the public that his Price Catalogue is now ready, and may be had by enclosing a postage stamp. Strong and vigorous Plants are now ready to send out, and the greatest care is observed in packing; also Plants gratis to recompense for long carriage. Early orders will insure obtaining desired sorts, as it frequently happens that some particular varieties are sold out before the end of the season.
W. C. has also a fine collection of Roses, Pansies, Carnations, Chrysanthemums, &c., &c., of which Lists may be had on application.—Saffron Walden, Sept. 6.

NEW FUCHSIAS, VERBENAS, PETUNIAS, AND CANTUA DEPENDENS.
GEORGE SMITH begs to offer the following new varieties of the present season as above, viz.:—VERBENAS, (Smith), British Queen, Enchantress, Exquisite, Grandis, Othello, Shylock, King, Eliza, Voltigeur, Prince of Wales, Wonder (Young's), Lady of the Lake, Model of Perfection (Turner's), Beauty, Admirable, Compacta, Marchioness of Cornwallis. French varieties:—Blanche de Castle, Jean Bart, General Bedeau, Eugene Sue; the above good plants at 12*s.* per dozen. The following New FUCHSIAS, at 21*s* per dozen:—Smith's Sedonia Alpha, Psyche (Banks), Voltigeur, Madame Sontag, Brilliant, Princess, Loveliness, Conspicua, Henderson's Madame Sontag, Resplendens, Prime Minister, Expansion, Elect (Knight's), Duchess of Kent (Batten), Clapton Hero, Pagoda (Story's), Attraction, Prince Arthur, Devoniana (Tiley's), Koh-i-Noor (Miller), Longipes, Mazeppa, Admirable, Madame Liboies, Louise Miller.
PETUNIAS:—Young's Attraction, Crimson King, Rosy Circle (Smith's), Striata (Parson's), Grandis. HELIOTROPE REPTANS, at 1*s.* each. CANTUA DEPENDENS 3*s.* 6*d.* each.
A Descriptive Catalogue will be forwarded on receipt of one postage stamp.
Tollington Nursery, Hornsey Road, Islington, London.

NEW EARLY STRAWBERRY—"TROLLOP'S VICTORIA.
JAMES TROLLOP (who raised "Princess Alice Maud" Strawberry, which gave general satisfaction to the public in 1848), now with great confidence offers his seedling "VICTORIA," and is certain that it combines qualities which no other kind in cultivation does possess. Being very early, a dwarf robust grower, and free bearer, throwing strong trusses of fruit (above the foliage), which is of a large size, globular form, and good colour, with a delicious flavour.
Fine well-rooted plants, on and after the 8th September, 1851, at 4*l.* per 100.
For particulars of prizes and opinions, with full advertisement, see *Gardeners' Chronicle*, Aug. 2d, 1851, and "Beck's Florist, Fruitist, and Garden Miscellany," for August, 1851, or "Midland Florist."
N.B. Full particulars may be had free, per post, by applying to G. D. FISHER, at Mr. Butler's Nursery, Wedcombe, Bath.
Limpley Stoke, September 6.

DICKINSON'S ITALIAN RYE GRASS SEED is now ready for delivery—7*s.* per bushel.
No. 7, Curzon-street, May Fair, London.

HYACINTHS, &c.

CHANDLER AND SONS, NURSERYMEN, Wandsworth Road, Surrey, have just received from Holland their BULBS, in good condition.
Fine HYACINTHS, by name, per doz. ... ... 6*s.* to 12*s.*
TULIPS, NARCISSUS, CROCUS, &c., at moderate prices.
CAMELLIAS, well set with flower buds, per doz. ... 30*s.*
CHRYSANTHEMUMS, bushy plants for flowering this autumn, per doz. ... ... ... ... ... ... 12*s.*
Post-office Orders payable at Kennington Cross.

THE FINEST NEW ROSES OF THE SEASON.

HYBRID PERPETUAL QUEEN VICTORIA. (PAUL'S.) This is unquestionably the finest New Rose of the season; it is a seedling from "La Reine," of which it is so exact a copy in every respect, save colour, that it has been designated by some the "WHITE LA REINE." The ground colour is white, overlaid with the most delicate hue of pink, perfectly waxlike in appearance, and distinct from every other.
Plants, in November, 10*s.* 6*d.* each, with the usual discount to the Trade when three are ordered at once.
CLIMBING PERPETUAL, ROBERT BURNS (PAUL'S.) Flowers light vivid carmine, sometimes edged with purple, large, equal to Chenedole in colour; like it not very double, but possessed of the additional advantage of flowering in the autumn. Desirable on account of its distinct and glowing colour, and a splendid autumnal climber. Plants in November, 7*s.* 6*d.* each.
N.B. Each of these Roses has obtained a first class certificate from the National Floricultural Society; the former has also received the same from the Royal South London Floricultural Society. Also a fine collection of Hollyhocks now in bloom.
A. PAUL and SON, Nurserymen, Cheshunt, Herts.

DOUBLE ROMAN AND PAPER WHITE NARCISSUS, 4*s.* per dozen.—The above bulbs, the former of which is so justly esteemed for its early blooming and excessive fragrance, and the latter for its purity and elegance, have been just received at A. COBBETT'S Italian and Foreign Warehouse, 18, Pall-mall, near Waterloo-place.

SUPERB NEW PEA, "THE NOVEMBER PROLIFIC," supersedes all other varieties, yielding a crop of extraordinary abundance, stands the severe weather better than any others. It is of the richest flavour, and may be sown from November to July without missing a crop. Price 2*s* 6*d* per quart; to be had from W. HAMILTON, Seedsman, &c., 156, Cheapside, London.
*** A liberal discount to the Trade.

HYACINTHS TULIPS, CROCUS, NARCISSUS, &c.

JAMES CHARTRES, SEEDSMAN, &c., 74, King William-street, City, London, begs most respectfully to inform ladies and gentlemen about to purchase their annual supply of the above, that he has a splendid collection, all selected bulbs, which he can strongly recommend. Orders above 1*l.* forwarded, carriage paid, to any part of the kingdom.
A catalogue may be had on application.

CUTHILL'S BLACK PRINCE STRAWBERRY (TRUE).—The undersigned having a very superior Stock of the above favourite new variety of STRAWBERRY, the Stock originally obtained from the raiser, and the Plants very strong and well-rooted, they are induced to offer them to the public at 4*s.* per hundred; also very strong Myatt's Eliza, 3*s.*, and Myatt's British Queen Strawberries, 2*s* 6*d.* per hundred, packages included.
CLARKE and Co., Seedsmen and Florists, 86, High-street, Borough, London.
EARLY FLOWERS, FOR FLOWERING IN WINTER.
First-rate Hyacinths, for in-door culture, 6*s* p. doz. Dutch roots.
Due Van Thol Tulips ... ... ... 9*d.* do. do.
Crocuses, mixed, all colours ... ... 1*s.* per hundred do.
And everything else in the root way.

BAKER'S PHEASANTRY, Beaufort-street, Kings'-road, Chelsea, by special appointment to her Majesty and H.R.H. Prince Albert—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street, London.

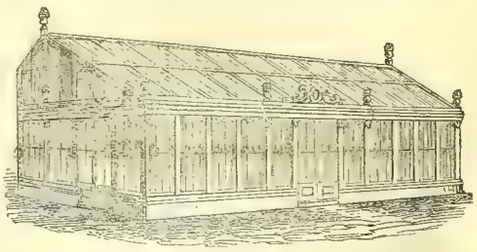
26 oz. ,, 3½*d.* to 7½*d.* ,, ,, ,,
PATENT ROUGH PLATE, THICK CROWN GLASS, and PATENT PLATE GLASS for Horticultural purposes, at reduced prices, by the 100 square feet.
GLASS TILES AND SLATES made to any size or pattern, either in Sheet or Rough Plate Glass.
Propagating Glasses, Bee-hive Glasses, Cucumber Tubes, Glass Milk Pans, Glass Water Pipes, and various other articles not hitherto manufactured in glass.
PATENT PLATE GLASS.—The present extremely moderate price of this superior article should cause it to supersede all other inferior window glass in a gentleman's residence. No alteration connected with the sash is required.
GLASS SHADES, as ornamental to, and for the preservation of every description of goods susceptible of injury by exposure. Prices, since the removal of the excise duty, reduced one-half. List of Prices and Estimates forwarded on application to JAMES HETLEY and Co., 35, Soho-square, London.

WANTED, for Fruiting in Pots, a quantity of BLACK HAMBURGH VINES.—Address, stating price, &c., to J. T., Post-office, Sevenoaks, Kent.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

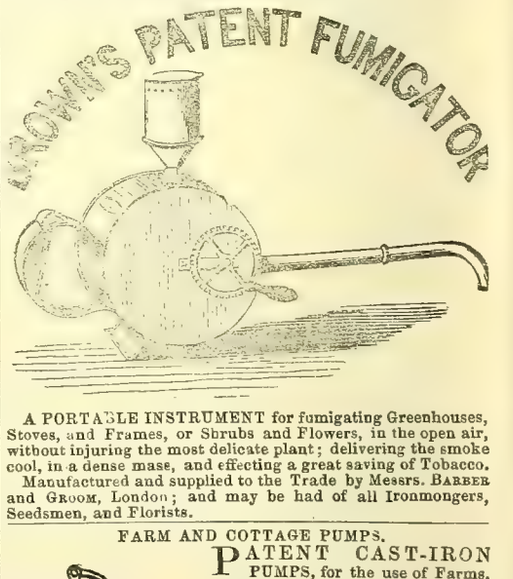


J. WEEKS AND Co., King's-road, Chelsea, HORTICULTURAL ARCHITECTS, ENGINEERS, and BUILDERS. These Boilers are very powerful, durable, and economical. The fire warranted to last 15 hours without attention. The Furnace Bars are Hollow Tubes, through which the return water passes before entering the upper part of the Boiler, thereby causing a very rapid circulation, and producing double the effect from the same quantity of fuel.

J. WEEKS and Co., King's-road, Chelsea, CHALLENGE the whole world to make a Boiler that will produce anything like the same effect, with the same quantity of Fuel, in a given time. It is one of these Boilers that warms the water of their VICTORIA REGIA Tank, which contains 9000 gallons, and also heats several large Forcing-houses and ranges of Pits, with a small consumption of fuel.
Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

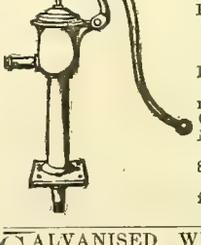
GREEN AND HOTHOUSE BUILDER.—Green and Hothouses made by Machinery, sent to all parts of the United Kingdom. These Horticultural Buildings are warranted to be made of the best materials, and the cheapest in England. Lists of prices post free. 1½ in. greenhouse lights, 2½*d*; 1¾ in. ditto, 3*d.*; 2 in. ditto, 3½*d.* per foot; if glazed with 16 oz. sheet glass of a large size, 4*d* per foot extra.
J. LEWIS, Horticultural Works, Stamford-hill, Middlesex.

HOTHOUSES AND CONSERVATORIES.



HOTHOUSES AND CONSERVATORIES made and fixed complete in all parts of the kingdom, at a considerable reduction. One, two, and three-light Cucumber and Melon Boxes, and Lights of all sizes, kept ready for use, packed and sent to all parts of the kingdom, warranted best material. Garden Lights of every description, at JAMES WATTS', HOTHOUSE BUILDER, CLAREMONT-PLACE, OLD KENT-ROAD. References may be had to the Nobility, Gentry, and the Trade, in most of the counties of England.

MILDEW.

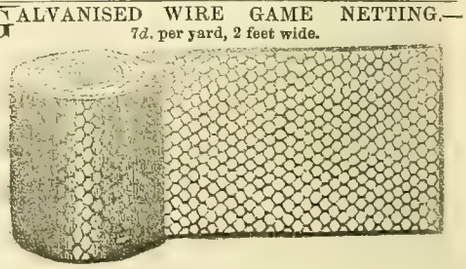


EPPS'S SULPHURATOR may be had of all Nurserymen, Seedsmen, and Ironmongers, price 21*s.*, and upwards. The Trade supplied by Barber and Groome, Holborn, London.
This Machine has been used by the following persons, and the highest testimonials have been received as to its valuable properties, in effectually destroying the Mildew on Grapes, Peaches, Peas, and all other horticultural produce:—Dr. Plomley, F.R.S.; Mr. Ingram, gardener to her Majesty at Windsor; Mr. Smith, Superintendent at the Royal Gardens, Kew; Mr. Iveson, Sion House; Mr. Glendinning, Chiswick; Mr. Thompson, Horticultural Society's Gardens; Mr. W. P. Ayres, Blackheath; Mr. Gaines, Battersea; Mr. Cole, gardener to — Colyer, Esq., Blackheath; Mr. Robson, gardener to Earl Cornwallis, Linton Park; and many other scientific and practical men.—High-street, Maidstone, Sept. 6.

PRICE TEN SHILLINGS AND UPWARDS.

A PORTABLE INSTRUMENT for fumigating Greenhouses, Stoves, and Frames, or Shrubs and Flowers, in the open air, without injuring the most delicate plant; delivering the smoke cool, in a dense mass, and effecting a great saving of Tobacco.
Manufactured and supplied to the Trade by Messrs. BARBER and GROOM, London; and may be had of all Ironmongers, Seedsmen, and Florists.

FARM AND COTTAGE PUMPS.



PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

| | | |
|---|---|---|
| Patent Pump | ... | ... £1 16 0 |
| Patent Pump, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing | ... | ... 2 12 0 |

Larger sizes if required.
May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers.
JOHN WARNER & SONS, 8, Crescent, Jewin-street, London.
Every description of Machinery for Raising Water, Fire Engines, &c.
The usual allowance to the Trade.

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.

| | | | Galvanised. | Japanned, Iron. |
|---|---|---|---|---|
| 2-inch mesh, | light, 24 inches wide | ... | 7*d.* per yd. | 5*d.* per yd. |
| 2-inch ,, | strong ,, | ... | 9 ,, | 6½ ,, |
| 2-inch ,, | extra strong ,, | ... | 12 ,, | 9 ,, |
| 1½-inch ,, | light ,, | ... | 8 ,, | 6 ,, |
| 1½-inch ,, | strong ,, | ... | 10 ,, | 8 ,, |
| 1½-inch ,, | extra strong ,, | ... | 14 ,, | 11 ,, |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised sparrow-proof netting for Pheasantries, 3*d.* per square foot. Patterns forwarded post free.
Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

NEW PELARGONIUMS.

CHARLES TURNER strongly recommends the following NEW PELARGONIUMS; it will be sufficient to observe that he has the entire stock of those beautiful varieties raised by E. FOSTER, Esq., and G. W. HOYLE, Esq., which obtained 9 extra prizes, and 20 Certificates, during the past season. Strong plants will be ready the first week in October. The usual discount to the Trade. If the Set is taken, a liberal allowance will be made.

ARIADNE (FOSTER).—Rosy purple bottom petals, rich dark top, with narrow margin of rose, clear white centre, free bloomer, large truss, and fine substance; good early exhibition plant; 31*s.* 6*d.*

BEATRICE (HOYLE).—Neat smooth constant flower, bottom petals mottled rose, top petals rich black, even margin of dark carmine, free bloomer; 15*s.*

CELIA (HOYLE).—Beautiful orange lower petals, tinged towards the centre with violet, top petals bright orange, medium spot shaded with scarlet, free and early bloomer, but curly in top petals; 15*s.*

CHIEFTAIN (HOYLE).—Rose crimson, with dark shaded blotch on upper petals, fiery, narrow margin, large, very stout, good habit, rather inconstant; 21*s.*

CHLOE (HOYLE).—Lively bright rose, white centre, medium-sized dark spot shaded with scarlet, good grower and free bloomer; 10*s.* 6*d.*

COLONEL OF THE BUFFS (HOYLE).—Novel bright orange, large and very attractive, constant, and free bloomer; 31*s.* 6*d.*

CRISTINE (HOYLE).—Delicate warm rose, with deep spot on upper petals shaded with orange, large and very free, a fine cheerful flower; 21*s.*

ELISE (HOYLE).—Deep warm orange pink, shaded with delicate lilac, light centre, medium-sized spot, surrounded with orange, margin of orange pink, smooth, constant, and free bloomer; 31*s.* 6*d.*

ENCHANTRESS (FOSTER).—Rosy crimson bottom petals, rich crimson blotch on top petals, with margin of bright crimson, white centre; the shape of Gipsy Bride, but twice the size, free bloomer, and good habit; 31*s.* 6*d.*

EURYDICE (FOSTER).—Deep crimson bottom petals, top petals dark maroon, narrow margin of bright crimson, free bloomer; 15*s.*

GANYMEDE (HOYLE).—Very round, smooth, and cupped, warm lilac colour, white centre, dark top petals, very evenly shaded with purplish carmine margined with the ground colour; 31*s.* 6*d.*

HERALD (HOYLE).—Mottled light pink bottom petals, top dark blotch, with narrow margin, white centre, good shape, and constant, very dwarf, good habit; 7th prize; 21*s.*

ILLUMINATOR (TURNER).—Bright mottled crimson bottom petals, rich dark crimson top, narrow bright margin, very showy and attractive, being nearly as free as the Fancies; 10*s.* 6*d.*

LABLACHE (FOSTER).—Orange rose, with dark blotch on the top petals, large white centre, good substance, very attractive variety; 21*s.*

LAVINIA (FOSTER).—Purple, similar in colour to Alonzo, but of finer form, rich dark top petals, with bright margin, good habit, and fine bloomer; 21*s.*

LITTLE NELL (TURNER).—Rosy lilac bottom petals, maroon top petals, narrow margin of rose, white centre, very free, early bloomer, good plant for exhibition; 10*s.* 6*d.*

LORD MAYOR (BLACK).—Bright crimson scarlet bottom petals, mottled, black blotch on the top petals, shaded off to the margin with scarlet crimson, very showy, and free bloomer; 15*s.*

MAGNET (HOYLE).—A high-coloured scarlet crimson, large black blotch varying towards the margin on a scarlet crimson ground, without being lighter on the edge, very profuse bloomer, and constant, very striking flower; 42*s.*

MOCHANNA (HOYLE).—Lower petals warm rose, white centre, top petals large dark blotch, shaded and mottled with scarlet, margin of ground colour, large fine shape, free, smooth, bold, attractive flower; 21*s.*

MONTEITH (FOSTER).—Bottom petals crimson purple, dark blotch on top petals, shaded off to the margin with crimson; 21*s.*

PLANTAGENET (TURNER).—Crimson bottom petals, dark maroon top petals, narrow margin of bright crimson, free bloomer; 15*s.*

PULCHRA (FOSTER).—Lower petals salmon rose, large rich dark blotch on top petals, with margin of bright rose, white centre; free bloomer, good habit; 21*s.*

PURPLE STANDARD (FOSTER).—Bottom petals rich purple, black top petals, with narrow, even, fiery margin. This flower possesses fine substance, shape, and very smooth; much the best purple; 31*s.* 6*d.*

REMUS (HOYLE).—Deep rose lower petals, with dark blotch on upper petals, shaded with scarlet; smooth, and fine shape; 21*s.*

RUBENS (FOSTER).—Crimson, with dark maroon blotch on top petals, narrow margin of bright crimson; good substance; 21*s.*

SHYLOCK (FOSTER).—Bottom petals deep rich mottled purple, black top petals, a wire margin of scarlet; medium size, free bloomer; the darkest variety raised; 31*s.* 6*d.*

VANDYKE (TURNER).—Bottom petals bright scarlet crimson, dark blotch on top petals, scarlet margin; very striking, but not a good shape; 10*s.* 6*d.*

VONDEL (HOYLE).—Lilac rose, with dark blotch on top petals; 15*s.*

A selection of older varieties at moderate prices. A Descriptive List may be had on application.

Royal Nursery, Slough.

*SATURDAY, SEPTEMBER* 6, 1851.

MEETINGS FOR THE ENSUING WEEK.

TUESDAY, Sept. 9—London Floricultural.....6 P.M.

COUNTRY SHOWS.—Tuesday, Sept. 9: Shacklewell Dahlia. Falmouth and Ashford Horticultural.—Wednesday, Sept. 10: Maidstone and Wallingford Horticultural.—Wednesday, Sept. 10, and Thursday, Sept. 11: Hexham Floral and Horticultural.—Thursday, Sept. 11: Ipswich, Bath, and Cheltenham Horticultural.—Friday, Sept. 12: Beccles Horticultural.

IN the year 1834 Capt. COLQUHOUN, of the Royal Artillery, communicated to the Society of Arts some specimens of the dried Plantain fruit of Mexico, with the following account of it.

"The sample was brought from Mexico, being prepared in the hot country (*Tierra caliente*) of Jalisco and Mechoacan, whence the fruit is sent to the higher parts of Mexico, the temperature of which is too low for the successful cultivation of the Plantain.

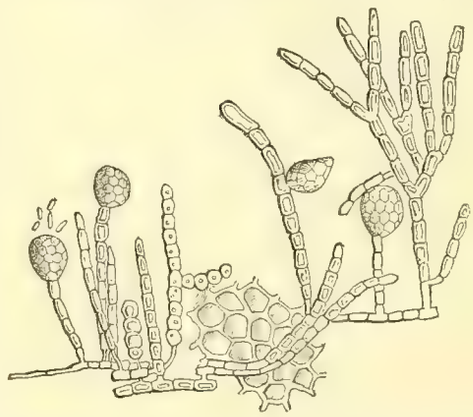
"The mode of its preparation is as simple as possible. The fruit is gathered when fully ripe, and is laid on light cane frames exposed to the sun. When it begins to shrivel, the outer skin is stripped off,* and then the drying is completed. During this process it becomes covered with a white mealy efflorescence of sugar, as the Fig does under similar circumstances. For convenience of transport, it is pressed into masses of about 75 lbs. each, and is wrapped in Plantain leaves. It is evident that the fruit in this state bears precisely the same relation to the fresh Plantain that the Raisin and dried Fig do to the fruits from which they are prepared, and may be expected to keep good as long as either of them."

The sample in question was described by the Secretary of the Society of Arts as being, when it came into the possession of the Society, about two years old, sufficiently moist, of a consistence and flavour between the Date and the Fig, and very sweet, without any acidity: there were no seeds, the whole of the fruit being eatable.

A portion of the very same sample, which had been transferred to a baggage warehouse at Woolwich, and left there since 1835, and which is consequently now *nineteen years old*, has been placed by Col. COLQUHOUN in one of the galleries of the Industrial Exhibition in Hyde Park; and, with the single exception of having become rather dry, is in as good a state as in 1834. It is not acid, its taste has undergone no change, it does not indicate a trace of mites, and it is in every respect fit for consumption, not only as a wholesome, but as an agreeable article of food, far better than the Dates or four-fifths of the Figs that are sold in the London market. The only alteration that deserves notice is the spontaneous separation of many of the cells containing what seems to be uncrystallisable sugar, in the form of brown granulations; but these are just as good in flavour as the more solid parts.

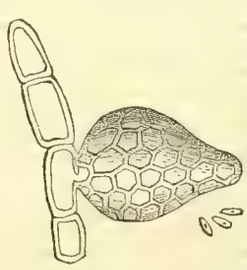
What have we in the market, let us ask, that can be compared with these Mexican Plantains? After lying in a baggage warehouse for nineteen years, Raisins would be bitter and woody, Dates would be little better, and as for Figs, the mites would have destroyed what was originally eatable, leaving their leathery jackets to nourish dry rot, or to resolve themselves into a kind of sawdust. We all know indeed that none of the dried fruits consumed in this country are eatable at the end of a year, with the single exception of Dates.

This striking fact raises the very important question, whether dried Plantains cannot be made a profitable commercial article. From British Guiana, as well as Jamaica, Trinidad, Barbados, and other West India islands, an unlimited supply might be furnished. We have learned from the example set by Lord HARRIS what may be expected from the West India islands, when under the administration of enlightened governors. If Trinidad can enter advantageously into competition with the world with her Tobacco, her Cacao, and her Spices, why should she not add as yet another article of produce with her dried Plantains?



The quantity of similar fruit imported last year was as follows:—Figs, 33,964 cwt.; and Raisins, 276,312 cwt.

According to Col. COLQUHOUN, in 1834, the dried Plantain may be expected to be imported from the West Indies, all charges paid, but exclusive of duty, for about 28*s.* per cwt., or 3*d.* per lb., including 10 per cent. of profit to the grower. This price, it is true, was calculated on the production of Demerara, where the soil is richer than in the islands; but, on the other hand, the charges are also higher than in the latter.



If this was so, and it is not improbable that the price remains without much alteration, it is clear that dried Plantains might enter into direct competition with Figs, and similar produce; and if admitted duty free, as our colonies would be entitled to expect, their low price, better quality, and admirable keeping property, would cause them to be much more generally consumed. It would, however, be necessary for the colonists to be careful how they prepared them, because samples have come under our observation formerly which were very inferior to those produced by Col. COLQUHOUN.

SOME slices of the skins of Lemons were forwarded to us in the summer of last year, by Mr. STEPHENS, of Bristol, which on the unpacking of a chest were found to be nearly covered with a thick black felt, and consequently quite unsaleable. It is well known that of late years the crops of Oranges and Lemons in the Azores and other fruit islands, like the Coffee plantations of Ceylon, have been dreadfully affected with a smutty fungus, which either greatly impairs the vegetative powers of the trees, or totally destroys them. It appears that in every such case the disease is preceded by an insect, the excrements or secretions of which form a nidus on which the fungus is developed. The first thing, then, is to destroy the insects, if possible; for if these once gain a head, the eradication of the mould is quite impracticable. Its growth is evidently extremely rapid, and the creeping mycelium extends with the greatest ease from the little soiled spots on which it was first developed. It is quite beyond belief that the Lemons could have been packed in a state such as would render their rejection certain on being unpacked; the greater part of the growth, therefore, must have taken place in the course of the short passage to England.

The substratum of the curious mould consists of a single layer of angular cells closely applied to the surface of the fruit, and following all its inequalities. From this arise a quantity of creeping threads, which are at first very slender and sometimes inarticulate, two or more being frequently so closely incorporated as to make their separation very difficult. Some of the articulations increase rapidly in thickness, and are often more or less swollen; they are quite smooth externally, and contain occasionally one or two minute nuclei. From the creeping

threads others are given off which are erect, sometimes simple, but frequently more or less branched, and occasionally distinctly and repeatedly forked.

The fruit is generally formed by a metamorphosis of the terminal joint of the simple flocci, but sometimes is formed laterally on one of the joints. Though varying in form from globose to pyriform, the structure is the same in either case. The wall consists of a single stratum of angular cells, and the cavity is filled with a mass of minute, oblong, or obovate oblong spores, which frequently contain a single nucleus, and which escape from the apex, which is either perfectly obtuse or papillæform. The species, like most of the genus, is but ill defined, but may be distinguished by its smooth threads, which vary from cylindrical to moniliform, and the mostly terminal sporangia. In some specimens the *Antennaria** is mixed with *Capnodium Citri*, BERK. and DESM.

This, indeed, like that of *Erysiphe* and *Oidium*, is one of the curious instances in which one genus of fungi is so constantly attendant on another, both perfecting their fruit. It was not intended in our observations on the genera just named, to intimate that one species of plant is ever converted into another; but it is very possible that one species should present two forms of fruit, both of which are capable of propagation. So many instances of such intimate connexion between fungi of very different characters occur, as to make some such diversity in the vegetation of the same species highly probable, and the more so as the matter is placed beyond all doubt in the animal kingdom.

Some surprise has been excited by our assertion, in a recent number, that the greater part of the Epiphyllous species of *Oidium* are merely a form of so many species of *Erysiphe*. The subject is certainly one of some difficulty; for even though it be proved on repeated observation that the *Erysiphe* does spring from the thread of the *Oidium*, a question may arise whether it be a peculiar form of the species, or merely a parasite. Now, if Dr. PLOMLEY's observations are correct, we conceive the case is decided, for the conversion of a single cell of one species into a sporangium of another species, without the slightest appearance of mycelium, seems altogether untenable, especially when the analogy of *Antennaria* is taken into the question. We wish, however, at present, to point out two very curious cases of very different fruit upon the same plant, where there can be no question of parasitism. Having examined both, we speak, not merely from report, but from personal observation. The first, and perhaps least striking case of the two, is

* The stripping off the skin is a very essential part of the process, as it acquires an unpleasant flavour by drying.

* The species may be characterised—*Antennaria Stephensii*; n. s. filis sterilibus repentibus fertilibus erectis, articulisque glabris polymorphis; sporangiis ut plurimum globosis ex articulis enatis, quandoque lateralibus mamillatis.

that of an extremely pretty mould, figured by CORDA under the name of *Discophora elegans*, which we have had the good fortune to find in some abundance; the terminal vesicle is subglobose, as in most species of the genus, and traversed by a large pyriform columella, between which and the walls are seated a large number of oblong or narrowly elliptic sporidia; towards the base of the vesiculiferous stems, tufts of branchlets spring, regularly forked from six to nine times, each ultimate division being surmounted by a minute globular sac, without the slightest trace of columella, and containing from one to four broadly-elliptical sporidia. In this case the terminal vesicle is the normal fruit; the lateral cysts not agreeing in structure with the character of the genus; but as there is a perfect continuity of the threads which produce the two kinds of vesicles, there is not a shadow of doubt that these are two kinds of fruit co-existing on the same flocci.

The other still more remarkable case is that of *Agaricus racemosus*, a species unfortunately of very rare occurrence. The stem is here terminated by a pileus, with proper gills, as in other species of the genus; but through its whole course it is studded with short branchlets, each of which, instead of bearing a pileus, terminates in a little moist sporiferous head, exactly resembling in structure that of a *Stilbum*. In this case, equally with the former, there is no possible question of parasitism, though the two forms of fruit, both of which are doubtless capable of propagating the species, are as decidedly different as the deciduous spores of the *Oidium* and the sporangia of the *Erysiphe*. And if it should be replied that the structure in the two instances alleged does not present anything so technically different as naked spores and inclosed sporidia on the same plant, it may be replied that in a paper lately presented by M. TULASNE to the Academy, and in one by Messrs. BERKELEY and BROOME, read at the last meeting of the British Association, it has been shown that there is great reason to believe that in a multitude of instances asci are capable of transformation into naked spores, and that naked spores and fertile asci occur sometimes within the same perithecium. We do not wish to speak by any means dogmatically on a very difficult subject, but merely to show that we have not formed our conclusions without a careful consideration of the premises. *M. J. B.*

THE gentlemen who propose to contribute communications to the next Number of the JOURNAL OF THE HORTICULTURAL SOCIETY, are requested to do so without delay. It is not perhaps generally known that the authors of papers which appear in this Journal receive *gratis* a copy of the whole volume for the year.

## FLORICULTURE.

I do not know how long I may continue to address my floricultural friends, through the pages of the *Gardeners' Chronicle*, but I wish it to be known that I enter the garden of floral literature, as its curator, with a full knowledge of the varied and important duties which must of necessity devolve upon me.

Floriculture is, I may say, the only branch of domestic gardening not treated of in the *Gardeners' Chronicle*: I can bear testimony to the fact that no distaste for the pursuit has caused its all but omission; the question has long been, "Who's to do it?" At length my answer has been "I'll try," yet I must rely on and look to my floral friends for that assistance and support which, by joint efforts, shall make floriculture at least an interesting feature, if not an important one, in the pages of the periodical in question. I need hardly state that temperate and kindly discussions will alone be admissible; querulous—to say nothing of abusive—matter will be thrown aside; the pursuit is much injured by this kind of writing, even in its mildest form; personalities must be perseveringly avoided; our study must be to benefit the many without sacrificing the interests of the few; come one, come all, and let us cheerfully foster that good feeling and reciprocity of kindly sentiment now being made manifest throughout the width and breadth of the land.

Our advertising columns, I need hardly say, offer to florists a medium of giving publicity to novelties, alike valuable to buyer as to seller; let me, therefore, direct attention to them. The "lists of meetings for the ensuing week" may be increased, if secretaries will but furnish the dates of their respective exhibitions. Our remarks shall, as occasion requires, be made to touch coming and passing events; the "Home Correspondence" offers the medium through which will be registered our ideas practical and scientific, and will afford the means so long wanting of holding that intercommunication between distant growers by which all may be enlightened. Under the head "Societies" will be found notices of those meetings which, on account of their importance, require to be made permanent; this, we take it, will not prove unacceptable to the present readers of the *Gardeners' Chronicle*. Notices of Books (on Floriculture) will be given, if not ably, at least honourably; and finally, such "Answers to Correspondents" made as the merits of questions seem to demand. *John Edwards, Wace Cottage, Holloway.*

## ORCHIDS FOR THE MILLION.—No. XIV.

By B. S. WILLIAMS, gr. to C. B. WARNER, Esq., Hoddesdon.

CLIMATE HOT AND DAMP.—PLANTS GROWING ON SMOOTH BLOCKS WITHOUT MOSS.

*Saccolabium miniatum*, from Java; produces orange coloured flowers in March and April, and they last long in bloom. It does well on a bare block, and it should have plenty of heat and moisture during the growing season; it needs very little repose.

*Vanda Roxburghi*, a pretty Indian species, flowers in May and June; though it will succeed in a basket, it does best on a block suspended from the roof where there is plenty of heat and moisture, during the season of growth; afterwards it should be kept less moist, but equally warm, as it needs little rest: the flowers remain three or four weeks in perfection.

*Oncidium crispum*, from the Brazils, blossoms in October and December: the flowers are large, of a rich copper colour, and last in beauty three or four weeks, if kept in a cool place. This is a fine species, but rather difficult to cultivate; it does best on a block in heat and moisture while growing, afterwards it may be kept cooler and have less moisture.

*Oncidium Cavendishianum.*—The flowers of this Mexican species are large and yellow, mottled with brown. It blooms from January to February: it will thrive in a pot with peat, but it succeeds best on a large block suspended from the roof; it likes plenty of heat and moisture while growing; afterwards it should be kept much cooler, and have less water. It keeps in perfection six weeks, and is a most useful winter plant.

*Oncidium curtum*, blooms in July. It grows well on a block of wood, and requires the same treatment as the last named plant.

*Oncidium bicolor*, from the Spanish main, is a fine species, which blooms in September. The lip is very large, of a deep yellow on the upper side, and almost white underneath, the sepals and petals are yellow, spotted with crimson. It grows best on a block suspended from the roof. The flowers last long in pefection.

*Oncidium Papilio*, the butterfly Orchid, from Trinidad, flowers in succession nearly all the year round; it requires the same kind of treatment as species already mentioned.

## BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

SECTION D. *Monday, July 7th* (*continued from p. 549*). —*On the Monstrosity of the Common Wallflower* (*Cheiranthus Cheiri*); by Professor ALLMAN.—In this plant, which had been gathered at Dublin, the stamens were converted into carpels. The carpels were however not in the form of the ordinary carpels of Cruciferæ, but presented two stigmas, each of which had two horns. This the author regarded as the normal form of carpel in the family of Cruciferæ. If this was the case then we could only explain the usual position of the stigmas in Cruciferæ, by supposing that the two contiguous horns of opposite stigmata had united.—Dr. Lankester referred to the infrequency of the conversion of stamens into carpels. From an examination of some monstrous specimens of Brassica oleracea and Brassica napus, which he had laid before the British Association, at its two previous meetings, he had been led to adopt Dr. Lindley's theory of the structure of Cruciferæ, as the most correct. The tendency to form horns to the stigma in abnormal cases was no proof that the ordinary stigma of Cruciferæ was formed by the union of two horns.—Mr. Babington referred to the researches of Mr. Howell, on the structure of the fruit of Papaveraceæ, and also the view taken of the structure of the fruit of Cruciferæ, by Mr. Brown, which was that now maintained by Professor Allman.

SECTION C. *Tuesday, July 8*: *On Agricultural Chemistry, especially in relation to the Mineral Theory of Baron Liebig*; by Mr. J. B. LAWES and Dr. J. H. GILBERT.—In a recent article in the Agricultural Journal, Mr. Pusey had quoted the experiments of Mr. Lawes and Dr. Gilbert as being conclusive against the "Mineral Theory" of Baron Liebig, which asserts that the crops on the farm rise and fall according to the supply within the soil of the mineral constituents indicated by an analysis of the ashes of the plant. To these observations of Mr. Pusey, Baron Liebig has replied at some length in the new edition of his "Letters on Chemistry," just published, and in doing so, has asserted that the experiments alluded to are without value, and that the statements of the authors could only be made in ignorance of the *rationale* of agricultural practices on the large scale. The authors have therefore given in the present paper an outline of their investigations in Agricultural Chemistry; comprising an extensive series of experiments in the field on the growth of the principal crops entering into a rotation, as well as on the chemistry of the feeding of animals, and that of the functional actions of plants generally, in relation to the soil and atmosphere: in connection with all of which branches much laboratory labour has constantly been in progress since the commencement of the experiments themselves in 1843. The results selected by Mr. Lawes and Dr. Gilbert, in justification and illustration of their views, were those of the field experiments on Wheat, grown continuously on a previously exhausted soil for the last eight years, and in each season, by means of many chemical manures by the side always of one or more plots unmanured, and one manured continuously by farm-yard manure. Some of the results thus obtained were illustrated by a diagram, from which it appeared that mineral manures had scarcely increased the produce at all when used alone, whilst the effects of ammoniacal salts were very marked, even when repeated year after year on the same space of ground from which the entire crop—corn and straw—had been removed. Indeed, in this way, a produce had been attained even in the sixth and seventh succeeding years of the experiment, exceeding by nearly two-thirds that from the unmanured plot. It was then shown that the mineral constituents of the soil continued to be in excess, relatively to the nitrogen available for them from natural sources. The history of several plots was then traced down to the last harvest (1850), and it was argued that the statements assailed by Liebig, viz., that ammonia was specially adapted as a manure for Wheat, was fully borne out when speaking of agriculture as generally practised in Great Britain. In other words, that in practice it was the defect of nitrogen rather than of the mineral constituents that fixed the limit to our produce of corn. The authors next called attention to the fact of the exhalation of nitrogen by growing plants, as proved by the experiments of De Saussure, Daubeny, and Draper, and they referred to some experiments of their own, with the view of showing the probability that there is more of the nitrogen derived from manure given off during the growth of cereal grains than by leguminous and other crops; and hence might be explained the great demand upon nitrogenous manures observed in the growth of grain. The authors suggested that here was an important field of study, and that we have in the facts alluded to much that should lead us to suppose that the success of a rotation of crops depends on the degree in which the restoration of the balance of the organic constituents of crops was attained by its means, rather than on that of their mineral constituents, according to the theory of Liebig; whilst the means adopted to secure the former were always attended with a sufficient supply of the latter. Again, Prof. Liebig has quoted the processes of fallowing and liming, as being in their known results inconsistent with the views of Mr. Lawes and Dr. Gilbert; but these gentlemen considered that the experiments of Mulder and of Mr. Way on the properties of soils justified them in supposing that the processes of fallowing and liming owed their efficacy more to the accumulation of nitrogen in the soil from natural sources, than to that of available mineral constituents; the latter did, however, undoubtedly thus accumulate by those processes, and this fact should give us more confidence in views which, on independent evidence, supposed that they were not so easily liable to be found in defect in relation to other necessary supplies. It was next shown, by reference to what happens in actual practice as generally followed in Great Britain, where corn and meat constitute almost the exclusive exports of the farm, that the mineral constituents of the crops, taken collectively,—that is, as shown by the analysis of their ashes, could not be considered as exhausted: of these, however, phosphoric acid was lost to the farm in much larger proportion than the alkalies; whilst the latter would generally, by the combined agencies of disintegration of the native soil, and import in cattle food, be liable to diminution in but a very insignificant degree, if not in some cases to accumulation. Practical agriculture had, indeed, decided that phosphoric acid must be returned to the land from sources external to the farm itself,—viz., by bones, guano, or other means. But, on the other hand, artificial alkaline manures had generally been found to fail in effect. Indeed, taking into careful consideration the tendency of all experience in practical agriculture, as well as the collective results of a most laborious experimental investigation of the subject, both in the field and in the laboratory, it was the authors' deliberate opinion that the analysis of the crop is no direct guide whatever as to the nature of the manure required to be provided in the ordinary course of agriculture, from sources extraneous to the home manures of the farm,—that is to say, by artificial manures. Reviewing, then, the actual facts of practical agriculture, the authors could not agree with Baron Liebig when he asserted that our grand object should be to attain an artificial mixture to substitute for farm-yard manure, which he admitted to be the universal food of plants. The very practice of agriculture itself, as followed in this country, necessitates the production of farm-yard manure, and all our calculations should be made on the supposition of its use.

## BRITISH SONG BIRDS.

(CAGE BIRDS, No. 28.)

No. XLIV.—We are now gradually and gently gliding from the intense heat of summer, into the delightful, refreshing coolness of autumn. Never was the month of September heralded in more gladly than now; for the weather has been oppressively sultry, the bills of mortality have been heavily swollen, and the sun's scorching rays overpowering both to man and beast.

This is just the season for enjoying the beauties so peculiar to our climate at this particular time of the year. Every temptation is now before us to rise at break of day, and view the glories of the rising sun:—

> "Arise thou child of nature, rise!
> Arouse thy slumbering spirit now!
> The autumn sheaves are on the hill,
> And solemn are the woods and still,
> With clustering fruits on every bough."

Nor are there any inducements wanting to call us forth at the cool of evening, to watch the rapidly-increasing orb of the lovely, bright "harvest" moon, now within a few days of her attractions being at their height.

The autumnal crops, too, are now nearly housed, and the fields are beginning to show new signs of life in the

return of their former inhabitants—the birds. It is a pretty sight to view them in all the pride and majesty of their new and becoming plumage, and no less pleasant is it to listen to their song. It seems to savour, by its energy and sweetness, of gratitude and thankfulness to the Creator for this renewal of His great power. At all events, we may harmlessly imagine so.

It is with regret we have to record, as faithful historians of what is passing in the field, that with the advent of September man's better nature has, as usual, yielded to the overpowering seductions of the gun, which is now heard loudly recording its butcheries. Partridges, which have hitherto been luxuriating with their happy families in the corn, and enjoying the prescriptive privileges of freedom unmolested, are now savagely and unceasingly hunted from morning till night; and their lives either taken by a well-aimed shot (merciful, this!), or their limbs are shattered by some cockney sportsman, who has accidentally contrived to bring some part of their extended person within the radius of his well-spreading and heavily-charged gun barrel:—

"See! in the sun the circling covey bask
Their varied plumes, and, watchful every way,
Through the rough stubble turn the secret eye.
Caught in the meshy snare, in vain they beat
Their idle wings, entangled more and more;
Nor on the surges of the boundless air,
Though borne triumphant, are they safe; the gun,
Glanced just, and sudden, from the fowler's eye,
O'ertakes their sounding pinions; and again,
Immediate, brings them from the towering wing
Dead to the ground; or drives them, wide-dispersed,
*Wounded*, and wheeling various, down the wind."

Manly sport this, truly; especially when we reflect upon the very many maimed sufferers which escape, and which groan out their final agonies under cover of the brushwood!

But, as our own THOMSON sweetly sings, when bewailing the ravages made by these boasting, blood-thirsty Cossacks—

"*These* are not subjects for the peaceful Muse,
Nor will she stain with such her spotless song;
Then most delighted, when she social sees
The whole mix'd animal creation round
Alive and happy."——

Let us then at once resume the thread of our discourse, and speak of our little hero the white-throat.

This bird, commonly known in our southern parts as the Peggy White-throat, somewhat resembles the black-cap in its appearance; but it has a longer tail and shorter wings. Its head, too, is dissimilar, being of an ashy grey colour. Its throat and under parts are of a greyish white colour (sometimes a clear white), and its legs are pale brown. The hen differs little from the male; she is, however, of smaller proportions, less sprightly, and her colours are more dingy.

The white-throat (Sylvia cinerea) visits us about the middle of April, and at once takes up his quarters in our hedges, fields, and coppices. He is a familiar little fellow, and very soon after his arrival he sets about the one great business of his life—the building of a house, and the rearing of a family. He generally selects, as the most convenient site for his nest, a quiet, lone, or unfrequented field. Here, in a thick, low bush, he sets his architectural ingenuity to work, and constructs a local habitation of the fibres of roots, goose-grass, and moss; the interior being lined with horse-hair. The nest, I should observe, is very slight, and rather useful than elegant. As regards the provision made for warmth, the architect seems to leave *this* to the sun. The eggs vary in number from four to six; they are of a whitish colour, inclining to green, and are marked with delicate spots of olive green.

These birds are seen to far more advantage when at large, than when they are confined in a cage. They are of a lively, joyous disposition; and whilst singing, they rise on the wing, describe a circle in the air, and again resume their seat upon the bush from whence they started. Their notes, though of moderate compass, are very sweet, and rapidly uttered, and when you are near enough to them to judge of their vocal abilities, you will pronounce them first-rate. They seem quite aware of their excelling powers, and take a proud stand among the other orchestral performers of the grove.

I have had, from time to time, many of this tribe in confinement, and can give them good characters for temper, willingness to please, and sincere affection,—this latter being always evidenced in a grateful, graceful song, for all favours conferred, and all attentions paid. I should recommend their being placed in a cage, similar in every respect to that of the black-cap; for they love plenty of room, and also to see what is going forward. Hang them moderately low, and feed them on German paste, boiled egg, sweet bun, and bruised hemp-seed. Let their cages be kept particularly clean and sweet; and bear in active remembrance how they love a mealworm, spider, earwig, or woodlouse. All these luxuries you should, as occasion offers, bring mysteriously under their distant observation. You will be highly diverted to see how they will strain their little necks to keep the mealworms in view, while the latter are creeping along upon the table; nor will you be less pleased to note their affectionate gratitude, in return for any little favour you may confer in the way of such a treat.

Being a delicate bird, you must keep them snug and warm whilst moulting; and I should recommend their being fed during this ailment on liver gentles, of which they are very fond. Their time for leaving this country is about the middle or end of September. They will, at this season, be found very restless in their cages; but a few weeks will restore them to their usual serenity, and before Christmas they will be in song.

The proper place to purchase these birds, is that great ornithological emporium, which we have already immortalised—the Seven Dials. You must, whilst selecting your little prisoners, exercise the same discretion as I have before recommended. Always choose leisurely, and never decide until you have had ample opportunities for forming a correct judgment. Whether you will procure old birds, or "branchers," it is for yourself to determine. It must of course depend much upon circumstances.

As with the black-cap, you will find the "bath" a luxury looked for, and highly appreciated by the white-throat; nor are his gambols, whilst bathing, one whit less diverting. He must not, however, enjoy himself in this way oftener than twice daily, in the summer; in the winter, *never*. Cramp would follow such an ill-judged indulgence, and his career would speedily terminate.

When I whisper that Elder berries, boiled milk and bread, soaked grocers' currants, a soft roasted Apple, and occasionally a little piece of raw, scraped beef, are amongst the delicacies in which this bird delights,—I feel sure he will be accommodated with each and all in turn. Then can we, with the more pleasure, solace *ourselves* with the luxuries of the season,—all so tempting! 'Tis now

"——— The sunny wall
Presents the downy Peach, the shining Plum,
The ruddy fragrant Nectarine; and dark
Beneath his ample leaf, the luscious Fig."

Never has Nature, in her bounty, shown herself more lavish of these grateful gifts to man, than at the present time of writing. *William Kidd.*

## GARDEN SYRINGES AND ENGINES.

FEW things are of more importance in gardening than good syringes and garden engines. We have seen and had experience of many, but we presume it would be difficult to find more efficient implements of the kind than those exhibited in Class IX., No. 89, in the Great Exhibition, from Mr. Read, of Regent-circus. The improvements in "Read's engines" consist in a peculiar arrangement of the valves, leverage, &c., by means of which the power is considerably increased. The tubes, which are made either of vulcanised India-rubber, or of metal, with universal joints, are more durable than any hitherto invented.

His syringes have likewise been greatly improved by the addition of a new angle branch (or universal joint), turning in all directions, for the purpose of washing the under surface of the leaves of plants, &c., which will be found of much value in freeing them from insects.

The only objection that we have ever heard made to Mr. Read's syringes, &c., is, that they are expensive. They are, however, the best that can be manufactured; and many think that their durability and economy in working prove them to be cheapest in the end.

## FOREIGN GARDEN GLEANINGS.

REVEL (ESTHONIA).—Market gardening is carried on at Revel on a large scale; most of the gardens are situate in the Faubourg des Maréchaux, and are very well kept. We were sorry that we were unable to examine them properly.

The park and chateau of Revel deserve attention; like all other places founded by the Empress Catherine II., the palace and gardens are very magnificent. Long avenues of Lime and Horse Chesnut trees, of a large size, cross each other continually, and wide borders edged with Hemerocallis flava, Campanula, Aster, and other perennials, produce a very pretty effect. The park is a fashionable Sunday promenade in the fine season.

RIGA GARDENS.—The city of Riga contains several fine private gardens; there is no botanic garden, but at a short distance from the city gates there is a fine establishment belonging to Mr. Henry Wagner. The plants which are most commonly cultivated are of an ornamental description; there is, however, a fine collection of the best sorts of fruit trees taken partly from the rich nurseries of M. Jamin. Nearly all the trees are grown in tubs, like Orange trees. They are all bushy, and were, when we saw them, loaded with fruit; plants 6 to 8 years old sell for 30 to 40 shillings. We were shown a collection of 100 sorts of Gooseberries, which are grown for the houses in the north. Dahlias are cultivated upon a large scale here, as in most other Russian gardens; many of these plants are also sent to the north, where the fine season lasts but three months. In order to obtain early flowers, a stronger sort than the common one is cultivated. They are multiplied in autumn, kept through the winter in pots under sheds, and at the beginning of the fine season, they are sent away ready to flower.

Fuchsias and Pelargoniums are plentiful; Camellias, Rhododendrons, Azaleas, and other showy plants, are cultivated with nearly as much skill as with us. Some genera are even better represented, and are grown with greater simplicity and ease than is usual in our own gardens. Calceolarias, for example, which we torment so much, are grown here in the open ground. We saw a collection of herbaceous tree Pæonies of the best sort; the indigenous yellow flowered-variety, Pæonia Wittmanniana, of Hartwiss, which is rare with us, is here found in great abundance. Lilium lancifolium, and fine Japan Lilies, especially L. longiflorum, are grown in large quantities; Ericas, too, are common.

There is also a large assortment of choice herbaceous plants, classed according to their importance, and grown in beds from one to two yards square, according as they are little or much in demand. The plants from New Holland and temperate climates are arranged in stages round a large mound of earth, so that each species can receive the requisite quantity of light and air. Orange trees are common.

Nurseries occupy a large space, although they contain only the rarest and most beautiful plants; those, for example, with large flowers, variegated foliage, deeply-cut leaves &c.; the weeping Lime, Service tree, double-flowered Peach. In a good collection of Conifers, we saw Abies Pichta, which deserves a place in all landscape gardening. Hothouse plants occupy a considerable space; many specimens of Cycads and Musads were very fine. The Date Palm is in considerable demand, from the use made of it in Jewish religious ceremonies. In this establishment we found some of the finest tree Roses we ever saw. There are many with stems two or three yards in height, and two or three inches in diameter; when we were there, these plants were the object of much attention.

From Messrs. Wagner brothers may be obtained seeds of all the Conifers, and of the Haricot Beurre, which is cultivated very largely.

The country between Riga and Vindau is nothing but a series of sandy plains, enlivened here and there by a few white Willows, but where the country becomes slightly hilly, the dreary red or golden appearance of the sand is replaced by beautiful verdant prairies.

The isle of Gothland is for the most part covered with Pine forests, of wild appearance, and so far as we could judge, apparently thinly peopled. It is far otherwise with the island of Bornholm, a little to the south of the last; here there is a fertile soil bearing heavy crops of all descriptions, but more particularly of corn. The island is inhabited and cultivated by Danes.

From Bornholm to Pomerania the passage is short, but the vegetation again changes, especially near Colbert and Stralsund, where great skill is shown by the inhabitants in the decoration of the outsides of their houses by plants of all sorts. The favourite plant for this purpose is the common European Bindweed.

The small river Suiwmun leads from Colbert to Stettin; the whole of the southern slopes of the hills near this town are covered with Plum trees to such an extent that one might imagine some Armenian forests had found a natural zone in the North of Europe. *Masson's Report.*

## Home Correspondence.

*The Raspberry Case.*—Having read the article on the subject of seed discovered in opening a barrow or tumulus in this neighbourhood (Wareham) with considerable interest, I hasten to forward my recollections of the circumstance, which may perhaps satisfy you that no imposition was practised by the gentleman who supplied you with the account at the time of the discovery. I was acquainted with many persons who took a deep interest in the matter at the time, among whom was the late Mr. John Sydenham, of Poole, then residing at Dorchester, and connected with the *Dorset County Chronicle*, whose deep research and accurate acquaintance with all such matters are too well remembered to render any passing tribute to his memory necessary. A barrow was, at the period named, opened on Ridgeway Hill, near the very ancient British hill fort, Maiden Castle, and seeds of the description named, found, some of which I saw at the time; and I then, as I do still, placed implicit faith upon the account which my friend gave me of the discovery. Some time afterwards I was informed that the experiment of trying whether the seed would vegetate, was conducted with great care, and the result had been that of producing the common Blackberry plant, upon which, in all probability, the warrior had breakfasted, and, ere the stomach had had power to act upon the seed, been slain on some neighbouring battle field. Being curious in such matters, I find I have preserved the *Dorset County Chronicle* of the period named, and from which I transcribe the following:—"It is a remarkable fact connected with the remains in this tumulus, that amongst the bones of one of the persons interred was found a portion of the contents of the stomach in an undecomposed state; and on examination this was found to contain a great number of small kidney-shaped seeds, in all probability the contents of berries which constituted part of the food of the tribe. The seeds are in fine preservation, and contain the entire pulp in which the vegetating principle resides." As connected with the present subject, I may perhaps be permitted to remark, that no part of England is more rich in relics of our aboriginal ancestry than Dorset, and the counties immediately surrounding it; but, it is a source of daily regret that the hand of the improver (!) should so ruthlessly destroy that which the withering hand of time has scarcely altered through a period of more than 2000 years. In the neighbouring Isle of Purbeck, there are parts of Druidical circles scattered about, some of which have, in my own memory, been split into fragments and employed to construct a drain on a bye-road across the heath, within a mile of the very ancient British fastness from which I now address you, Wareham, whose earthen ramparts, though so unique, are shamefully and wilfully destroyed; a barrow was opened not long since, solely for the purpose of using the materials to repair the turnpike roads—millions of loads of excellent gravel lying at the same moment nearer at hand, for the trouble of digging it. In this barrow upwards of 30 urns full of calcined bones and ashes were deposited, and most of them recklessly destroyed. Speaking of the length of time that the germs of vegetation may be retained in seed—have not bulbous roots been found in the hands of mummies, buried thousands of

years, which, on being planted, have grown and been found to be identical with the Onion or Leek of the present time? [No.] The Mummy Wheat is another case in point; and, it is a well-known fact that chalk taken from great depths in Fordington-field (which reaches to the rings of Maiden Castle, above referred to) will spontaneously produce the well-known Charlock, with which that field, to the annoyance of the farmer, is so richly coloured every year. *Chas. Groves, Wareham, Dorset.*——I am pleased to be able to afford some information in reference to the seeds of the Raspberry, furnished by Mr. McLean. I happened to meet that gentleman, with his friends and some labourers, upon their return from opening the tumulus; the circumstances were detailed to me, and upon my appearing interested in the matter, we proceeded together to the Inn at Dorchester, where the proceeds of their labour were displayed; they consisted of some coins (one silver, of the Emperor Hadrian), the tusk of a boar, which was pierced, as if it had been suspended, and the friction had worn the hole into an oval form, and a quantity of dark-coloured substances full of seeds! I asked permission to break off a small portion, which I separated in a glass of water, and throwing it upon a paper for examination, stated it to be Raspberry seeds; this was, however, questioned, and it was then proposed that it should be sent to yourself: this induced offering my card to Mr. McLean, and requesting the favour of his communicating the result of his inquiry; this was fulfilled, confirming my opinion; upon my asking for a small portion, for the purpose of testing its vitality, it was given under a promise that I should communicate the result to that gentleman at Weymouth. The seeds were sown in a pot and placed in my propagating house. The visits and inquiries of my neighbours respecting them were numerous, and a short time afterwards Mr. McLean and a friend called upon me here, and left a further small portion of the substance. Ten weeks and four days elapsed ere they exhibited signs of vegetation, when up sprang 109 young Raspberry plants. This was immediately made known to Mr. McLean, and at frequent intervals, up to about four years since, plants have been either furnished to that gentleman, or sent to parties at his request. These circumstances are known to many of my neighbours, and I perfectly recollect, that about a year after my first meeting Mr. M., I was at Smedmore House, in the Isle of Purbeck, when Mr. Manse produced the *Courier* newspaper, with an account of the affair, and my then stating that I was the party who raised the seeds. When the statement was given to me, there was not any mention of coffins, skeletons only; an adult and a youth were described as being found. *W. B. Page, Southampton.*

*Fruit Crops.*—I have been glad to learn (see p. 549), that my old friend Mr. Grey has a good crop of fruit in his northern climate (Northumberland). Mr. G. will be pleased to hear, that in the North Riding of Yorkshire, I, too, have a fine crop of wall-fruit. My Peaches and Nectarines have been planted about six years, and the average number of fruit on each tree is six dozen. I should think I took as many off after stoning, and they have borne equally well in the two previous years, and are in excellent health. Mr. G. has an advantage over me, *i. e.*, I have no fined walls. I consider canvas coverings to be of no advantage, and I never use them. I gave my mode of protection, recorded at p. 214, in your volume for last year, a fair trial, and I have insured a crop. I have heard great complaints made in this district, about wall-fruit. Apples are more plentiful. *William Culverwell, Thorp Perrow, Bedale.*

*Swifts and Hornets in Yorkshire.*—A correspondent remarks that he has not seen the swift or hornet in Yorkshire. I have seen a pair of swifts for the last three years in this neighbourhood; and in the north of Yorkshire, where I was spending a few days in the beginning of last month, I saw them almost daily. I have also seen the hornet's nest suspended in a Gooseberry tree; but it very much depends upon the heat of the summer whether we have any quantity of hornets or wasps. This summer I have not seen a hornet, and I think not half a score of wasps, while in hot summers they abound. *T. S., Holmfirth.*

*Potato Disease.*—I find in our *Worcester Journal* a quotation from the *Gardeners' Chronicle*, in which you have made some remarks on the prevailing Potato disease. I do assure you that no "mildew" can possibly produce the effects but too well known in this district. Not only is the absence of terrestrial electricity felt in the diminished vitality of the maturing Potato crop, but many other very juicy plants, and even trees, are suffering from it. Some Walnut trees, loaded with fruit, are looking as though they had been scalded or frost-bitten. The Dahlias, Parsnips, Celery, &c., are also exhibiting the exanimate appearance. When the philosophic mind shall receive the plain truth, that electricity is the *anima mundi*—the agent of all life, both animal and vegetable—the cause of all crystallisation—the polariser of the "great globe itself," and in the hand of the Great Author of All, his working agent, then some of the puerilities of modern materialism will perish. When naturalists learn that the nervous apparatus of the Sensitive Plant is as perfect as that of the gazelle, and that all its functions are regulated by as perfect a susceptibility, then they will see the beauty of that creation which is endowed with electric telegraphs—nerves—to carry out the laws of life given to the economy of each creation by the Maker. The brain is the positive battery; the ganglionic centres are the batteries of the negative or vital electricity, and between these, regulated by the vital imperishable spirit, all operations called life proceed in their destined course. *E. A. Turley, M. D., Ivy House, Worcester.* —— Disease has appeared in Gloucestershire, but as yet, I think, we are more frightened than hurt. It would be advisable that any curious facts should be noted, between this and storing time, to be forwarded to the *Chronicle*. *Falcon.* —— As disease is becoming rife, permit us again to recommend cutting off the shaws or tops as soon as they are infected, with the view of saving the tubers. Every year's experience convinces us of the utility of this practice; of course, it only applies to such as are forward enough to have produced tubers sufficiently large for use. It is presumed that few have ventured the cultivation of late varieties this season; we have, however, a few under peculiar treatment, on which the fatal spot has not yet appeared. *Hardy and Son, Maldon.*

*Exposing Plants in Pots to the open Air in Summer.*—Finding that a correspondent (see p. 550), has experienced such a decided advantage in placing his plants in the open air in summer, over keeping them in houses, I beg to offer the following remarks, in addition to what I formerly stated on this subject. Since he does not place any plant out until the wood is fully ripened, I presume he exposes them with a view to rest them, which, no doubt, in some cases is very useful, provided the plants can be kept from making a second growth. I find that insects are rather troublesome on plants out of doors as well as in houses, but they may be more easily destroyed in houses than in the open air. All kinds of plants are more or less affected by having the sides of the pots fully or even partially exposed to the open air. *Thomas Dowell, Amington Hall, Sept.* 1.

*The Virginian Nightingale.* — Your correspondent, "An Interested Querist" (p. 536), writing from Carshalton, thus speaks, among other remarks, of the Virginian nightingale:—"I have heard it asserted that these birds *will* breed, and might be acclimated HERE; but I want more tangible information. Will Mr. Kidd be so kind as to give us the benefit of his knowledge or experience on the point?" I will at once confess, that I have myself had no practical experience of the habits of this species, as it never formed an inmate of my aviary. Naturally interested, however, in acquiring a correct knowledge of the peculiarities of such a beautiful bird, I have, through the great kindness of Henry Taylor, Esq., of Belinda-terrace, Canonbury-square, obtained an insight into what must prove a most interesting study. Mr. Taylor is, like myself, an amateur; and all his observations are minute. Nothing daunted by repeated failures, and bitter disappointments — our common lot! — he has pursued his investigations with a constant assiduity, and unremitting perseverance, that have overcome every difficulty. Whether therefore as an apiarian—for he stands "alone" in his practical and most extraordinary discoveries in the economy of the beehive—or as an ornithologist, his "authority" is unquestionable. In the matter of the Virginian nightingale, he has succeeded to admiration. He has found out their habits to a nicety; and, by a long course of observation, remarked that, under certain circumstances, they will pair, lay eggs, sit, and *hatch*; this, even in confinement. When I mention that these several pleasing facts have, one and all, been over and over again proved in Mr. Taylor's conservatory, and that he is perfectly master of the interesting subject, I have stated enough for our present purpose. I understand he is himself about to communicate to the world, very shortly, the particulars with which he has become acquainted whilst devoting himself to the study of these birds. He is decidedly of opinion that they *can* be acclimated here, and he has a public site in view which he considers undeniably adapted for the purpose of their domestication. Beyond this simple statement of facts, I feel it would be unfair for me to venture. The matter is in good hands, and I shall watch its progress with much anxiety. Should we number among our native choristers so lovely a bird as the Virginian nightingale, and see him disporting in our parks and shrubberies, it will indeed be something of which we may proudly boast. *William Kidd, New Road, Hammersmith, August* 28.

*Pruning Forest Trees.*— I observe that this much vexed question is still open, and I now address you, because the one simple principle, upon which the whole art of safely pruning depends, is seldom brought forward in sufficiently explicit terms. The principle is, that whenever a branch is cut off, it must be done in such a manner that water cannot lodge in the wound. Now the only way of effecting this is to cut off the branch close to the stem of the tree. When this is done, new bark gradually forms over the wound and completely closes it, before decay can progress to any injurious extent, and as soon as the bark has thus covered the stump, no further decay takes place, and it is as safe as if hermetically sealed. If, on the contrary, a tree is pruned in such a manner that water can lodge in the wound, that wound will never heal, decay proceeds rapidly, and communicates by degrees into the heart and down to the very roots. Your correspondent "G. L." (p. 516), states that decay progresses in the interior, even where the wound has been completely covered with new bark; on this point I am at issue with him, I maintain exactly the reverse. The very example that he gives is in my favour, for he says that the branches of the decayed tree had been cut off "nearly close" to the trunk—that is, leaving short snags, which is the worst possible plan of pruning, and, I agree with "G. L.," infallibly ruins the timber. If the branches had been cut off quite close, I doubt not, no damage would have ensued. When a short snag is left it always dies, and as it decays, forms a sort of pipe which conveys water into the interior of the tree, to the ultimate destruction of the timber. *Expertus.* [We still say, with the utmost possible respect for our correspondent, and all other Experts, that the true principle of forest pruning is, not to "prune" at all.]

*Waxy Potatoes.*—Permit me to inform your correspondent "M. D.," that any Potato can be made waxy by the following plan, which is recorded in my pamphlet on the Potato. I cut the haulm off every alternate row, in order to allow sun and air to act on the soil, the Potatoes being previously about three parts grown. These rows were not dug up until the others were quite ripe. The cut down ones lost very much in weight, and the Potatoes would have just suited "M. D." They boiled firm, but were very waxy; in fact, what I call bad Potatoes. The sort was the famous Lapstone Kidney, a variety raised by a shoemaker in Yorkshire. When ripened properly, this sort is the best flavoured, and most floury Potato cultivated, and it is a great bearer. This late kind, wintered upon my plan, was dug up on the 9th August, and as usual I offered 2*d.* for every diseased one that could be got among them, but none was found. *James Cuthill, Camberwell, London.*

*The Cloth of Gold Rose.*—I have seen several stands of Roses at some of the different exhibitions of the season, and I have also searched your reports of the same, but nowhere could I see or find mention of the above variety, to my thinking, the "Queen of Roses." How is this? Is there greater difficulty in its culture, or is there only a particular soil that suits it? Having heard of parties who have found difficulty in flowering it, I thought I would just furnish you with the history of a magnificent specimen of it growing in this neighbourhood. The second week in June I visited the gardens of T. B. Western, Esq., of Felix Hall, and was there shown by his gardener, Mr. Bowie, a tree of it covering 10 feet of ground, upon which we counted 150 blossoms then open and opening, some of them measuring four inches over, an inch and a half in the cup, and beautifully perfect in shape; many of the blossoms were the size of hens' eggs just opening. Last week I saw the same tree, and counted 86 blooms then upon it, with the prospect of many more for the after part of the season. It has made shoots of this year's wood from 5 feet to 6 feet in length; it is growing in a moderately heavy loam; but I learned that formerly there was an old Asparagus bed near where this tree now stands, and I concluded that it was this that has made it what it is in four years, proving that it is richness of soil that it requires to make it successful; and I am sure, could Rose growers have seen this specimen in the perfection in which I saw it, instead of its being generally discarded from our lists, no one would think his collection complete without the Cloth of Gold. *R. R. W., Kelvedon.*

## Societies.

HORTICULTURAL, *Sept.* 2.—E. BRANDE, Esq., in the chair. Messrs. Lane, of Great Berkhampstead, produced two small imported Stanhopeas, and an example of Warczewicz's Achimenes Margarettæ, a new kind, with just sufficient flowers on it to show what a fine thing it might become under good cultivation. The blossoms are pure white, and approach in size those of longiflora.—Mr. E. G. Henderson, of the Wellington-road Nursery, sent young plants of Æchmea fulgens and the new sort called Æ. miniata discolor; Gesnera zebrina and an improved variety of it named splendens; Vriesia splendens with a gay spike of scarlet bracts at least a foot in length; Clitoria braziliensis; and the scarlet Isotoma triflora.—Mr. Summersby, gr. to Major Martyn, had a plant of Azalea fulgens scarcely an inch high, with three large flowers on it. This was obtained by taking off the flowering point from an old plant, and striking it; and it was stated that the blooms were larger and finer on the cutting than on the parent. The same grower also contributed examples of Goliath Plum, and a Netted Cantaloup Melon.—Mr. Fleming, gr. to the Duke of Sutherland, at Trentham, communicated an old Queen Pine-apple, weighing 7 lbs. It was an exceedingly handsome fruit, but hardly sufficiently ripe. A Knightian Medal was awarded it. —From Mr. Turnbull, gr. to the Duke of Marlborough, at Blenheim, came some Noblesse Peaches, one of which weighed very nearly 11 oz. They had, we believe, been ripened under glass. A Certificate of Merit was awarded them.—Mr. Martin, gr. to Sir H. Fleetwood, Bart., sent dishes of Muscat and Black Hamburgh Grapes; and some Raspberries were furnished by Messrs. Lane, of a sort known at Great Berkhampstead by the name of Victoria. The fruit shown was gathered from canes which were reported to have been in bearing from the beginning of the season until the present time.—From the Garden of the Society came eight varieties of Achimenes, the pretty yellow annual called Eucnide bartonioides, a small flowered Oncid, a fine plant of the gay Æchmea discolor, the rock Abelia (A. rupestris), the useful Babingtonia Camphorosmæ, two Cape Heaths, Cyrtoceras reflexum, the larger variety of Rondeletia speciosa, Gloriosa superba, and the following fruits, some account of which will be found in another column: Impératrice Nectarine, Pucelle de Malines, and Malta Peaches; Reeves's Muscadine Grape, Denyer's Victoria Plum, transparent Codlin Apple, and Reeves' Egg-shaped Gourd.

NATIONAL FLORICULTURAL, *Sept.* 4.—Mr. PERRY in the chair. Some good Seedling Dahlias were shown on this occasion. A certificate was awarded to Mr. Noakes,

for Phantom, a bright buff, well-formed flower, of considerable depth, and having a good centre. Mr. Keynes received a first class certificate for Triumphant, a ruby-red medium sized kind, of fair outline and average depth, centre firm; Ditto to Laura Lavington, from the same raiser. This is a dark salmon-brown with light tip, and desirable in shape, size, and centre. Mr. Rawlings was assigned a first class certificate for Dr. Frampton, a light-shaded purple, mottled flower, which we have mentioned before. Mr. Turner had a label of commendation for Morning Star and Globe, both promising sorts. In Hollyhocks, Mr. Bragg, of Slough, received a certificate for King of Roses, a fine kind, which probably would have had a higher award, had it not been injured by travelling. The same raiser was also voted a first class certificate for Swansdown, well shaped, a paper white. Labels of commendation were given to King of Yellows, Joan of Arc, and Safranot, from Mr. Parsons. The first of these would have received a higher reward if a spike had been shown instead of blooms. Some good Gladioli were communicated by Mr. Wilmore, who received a first class certificate for Miss Wilmore; a pleasing variety, and certificates for Josephine and Wellington, both good sorts, which cannot fail to find places in every collection. Mr. Mackintosh, of Maida Vale, Edgeware-road, showed a nice clear yellow shrubby Calceolaria, with the habit of Kentish Hero.

ROYAL SOUTH LONDON FLORICULTURAL, *S-pt.* 3.—The fifth and last exhibition this season took place on this occasion, and was nothing behind its predecessors in attractiveness. In miscellaneous collections of 15 Stove and Greenhouse Plants, the Small Gold Victoria Medal was awarded to Mr. Hamp, gr. to J. Thorne, Esq.; 2d, Gold Albert Medal, Mr. Over; 3d, Mr. Stanly. Among Nurserymen, Messrs. Rollisson received the Gold Albert Medal; 2d, Messrs. Pamplin; 3d, Mr. Hook. Cut Flowers were numerous and fine, and proved an attractive feature of the show. Dealers' Class: 1st, Messrs. Rollisson; 2d, Mr. Clark. Collections of Cut Roses were produced in high character, for freshness and fragrance: in Mr. Paul's group, which was first, were Therese Margot, Etendard de Marengo, Pius IX., Angeline Boccella, Comte de Montalivet, Julia de Fontanelle, Jean of Arc, Comte Bobrinsky, Ophrie, Chereau; Mr. Francis sent Cloth of Gold, Elise Sauvage, Princess de Modena, Leveson Gower, Augustine Mouchelet, Gonda, Maria de Beaux, Géant des Battailles, and Vicomtesse de Cazes. Hollyhocks, both in spikes and detached blooms, contributed largely to the general effect, and were greatly admired: Messrs. Chater, 1; Bragg, 2; and Paul, 3; each had spikes—among the sorts were Aurantia, Rosy Queen, Rosamond, Elegans, Sulphurea perfecta, Spectabilis, Magnum Bonum, Delicata improved, Surprise, Coccinea, Rosea grandiflora, Bella Donna; Mr. C. Baron, Model of Perfection, Enchantress, Walden Gem, Noblissima, Sulphurea perfecta, Sir W. de Eresby, Standard of Perfection, Susannah, and Sir D. Widdeburn, the last four being Scotch varieties. Some nicely-arranged Bouquets were exhibited by Mrs. Cuthill, of Camberwell. Verbenas were well represented by Mr. G. Smith, 1; and Mr. Stewart, 2; likewise by Mr. Lochner, 1; Mr. Young, 2; and Mr. Robinson, 3: from the Tollington Nursery were Macrantha, Defiance, Laura, St. Margarets, Surprise, Model of Perfection, Voltigeur, King, Heroine, Exquisita, Wonder, Vergrets, British Queen, Reine Hortense, Lady of the Lake, Figaro, Iphigene, Perfume, Aspasia, Minerva, Desdemona, Shylock, and Othello; Mr. Lochner's dozen were St. Margaret, British Queen, Reine Hortense, White Perfection, Voltigeur, Lady of the Lake, Exquisite, Enchantress, Ninon de l'Euclos, Laura, and Pochye. Messrs. Rollisson contributed some nice Orchids. An interesting group of 60 Alpine and variegated plants, in pots, were furnished by Mr. Wood. Dahlias: Of private collections there were 5 twenty-fours, 17 twelves, 6 six fancies, and 5 six new sorts. Dealers, 11 twenty-fours, and 5 twelve fancies. To these must be added several for extra prizes, together with many seedlings, three only of which, however, received Certificates, viz., a Fancy, Laura Lavington (Keynes), a dull red tipped white; Attraction (Jeffries), a fancy of but little merit; and Dr. Frampton (Rawlings), a small but meritorious flower, having the colours of Princess Radziville. Amateurs, 24: 1st prize, J. Edwards, Esq., with Sir C. Napier, Whale's Elizabeth, Summit of Perfection, Negro, Fearless, Mr. Palmer, Regina, Snowflake, Grenadier, Mr. Herbert, Duke of Cambridge, Duke of Wellington, Queen of Lilacs, John Edwards, Yellow Standard, Jullien, Thames Bank Hero, Earl of Clarendon, Cobden, Admiral, Miss Herbert, Roundhead, Gen. Faucher, and Baltic; 2d, Mr. Weedon, Hillingdon, with Beeswing, Mr. Edwards, Mr. Seldon, Earl of Clarendon, Coccinea, Anticipation, Toison d'or, Shylock, Magnificent, Bathonia, Scarlet Gem, Elizabeth, Roundhead Richard Cobden, Duke of Cambridge, Sir F. Bathurst, Admiral, Model, Seraph, Grenadier, Negro, Jullien, and Psyche; 3d, Mr. Hopkins, Brentford; 4th, Mr. White, Chelmsford. 12 Blooms,—1st prize Mr. J. Robinson, Pimlico, with Queen of Lilacs, Mrs. Seldon, Thames Bank Hero, Lady St. Maur, Earl of Clarendon, Mr. Seldon, Duke of Wellington, Cobden, Fearless, Essex Triumph, Sir C. Napier, and Sir F. Bathurst; 2d, Mr. Black, gr. to E. Foster, Esq., Clewer, with Leda, Model, Barmaid, Black Prince, Duke of Wellington, Queen of the East, Essex Triumph, Mr. Seldon, Mrs. Seldon, Earl of Clarendon, Sir C. Napier, and Cobden; 3d, Mr. James, Stoke Newington, with Earl of Clarendon, Mrs. Bacon, Duke of Wellington, Negro, Mr. Seldon, Sylph, Sir F. Bathurst, Admiral, Summit of Perfection, Hon. Mrs. Ashley, Essex Purple, and Sir C. Napier; 4th, Mrs. Mosley, Maida Hill; 5th, Mr. Bennett, Dulwich; 6th, Mr. Allen, Shacklewell; 7th, Mr. Kirkpatrick, Camberwell; 8th, Mr. Harris. Fancy varieties, six blooms: 1st prize, Mr. Black, with Empereur de Maroc, Raphael, Princess Louisa, Jenny Lind, Mrs. Hansard, and Pretty Polly; 2d, Mr. Edwards, with Mrs. Hansard, Rachael, Pretty Polly, Jenny Lind, Lady Grenville, and Elizabeth; 3d, Mr. Pope, with Highland Chief, Triomphe de Magdeburgh, Jenny Lind, Mrs. Hansard, Reizende von Elsthal. New Flowers: 1st prize, Mr. Black, with Model, Leda, Barmaid, Roundhead, Sir C. Napier, and Nepaulese Prince; 2d, Mr. James, with Nil Desperandum, Napoleon, Jullien, Roundhead, Admiral Napier, and Nepaulese Prince; 3d, Mr. Robinson, with Regina, Nil Desperandum, Roundhead, Sir C. Napier, Duke of Rothesay, and Nepaulese Prince. Nurserymen, 24 varieties: 1st prize, C. Turner, Slough, with Cobden, Barmaid, Model, El Dorado, Princess Radzivill, Beeswing, Queen of Lilacs, Mr. Seldon, Fearless, Thames Bank Hero, Magnificent, Black Prince, Earl of Clarendon, Gem, Nepaulese Prince, Duke of Cambridge, Sir C. Napier, Mr. Herbert, Duke of Wellington, Blanchfleur, Princess Louisa, Essex Triumph, Mrs. Seldon, and Sir F. Bathurst; 2d, Mr. Keynes, Salisbury, with El Dorado, Queen of Lilacs, Duke of Wellington, Seraph, Magnificent, Mrs. Seldon, Earl of Clarendon, General Faucher, Sir F. Bathurst, Yellow Superb, Essex Triumph, Gem, Beeswing, Miss Chaplin, Fearless, Snowflake, Mr. Seldon, Nonpareil, Madame Gouberts, Mr. Herbert, Princess Radziville, Frederick Jerome, Sir Robert Peel, and Negro; 3d, Mr. Barnes, Stowmarket, with Magnificent, Princess Louisa, R. Cobden, Fearless, Grenadier, Earl of Clarendon, Ambassador, General Faucher, Mr. Seldon, Mr. Palmer, Fame, Miss Chaplin, Seraph, Yellow Superb, Negro, Duke of Wellington, Queen of the East, Summit of Perfection, George Glenny, Uranus, Mrs. Williams, Thames Bank Hero, Charles Turner, and Sir F. Bathurst; 4th, Mr. Bragg, Slough; 5th, Mr. Drummond, Bath; 6th, Mr. Legg, Edmonton. Nurserymen, 12 Fancies: 1st prize C Turner, with Empereur de Maroc, Rachael, Elizabeth, Mrs. Willis, Pretty Polly, Mrs. Hansard, Lady Grenville, Jeannette, Mrs. Labouchere, Jenny Lind, Gasparino, and Floral Beauty; 2d, Mr. Keynes, with Princess Charlotte, Comic, Lady Grenville, Conspicua, Mrs. Hansard, Madame Wachy, Striata perfecta, Empereur de Maroc, Rainbow, Admiration, Jenny Lind, and Flying Dutchman; 3d, Mr. Barnes. For three blooms of Geo. Glenny: 1st, Mr. Black; 2d, Mr. Cook. In class showing, seedlings, the best Dahlia was Dr. Frampton (Rawlings); the best fancy, Laura Lavington (Keynes); the best Fuchsia, Nil Desperandum (G. Smith); the best Hollyhock King of Roses (Bragg); 2d, no name (Black); 3d, Satisfaction (Bragg). The best Verbena, National (G. Smith); 2d, Koh-i-noor (do.); 3d, Orlando (do.).

NORTH KENT HORTICULTURAL.—This meeting took place in the Gravesend, or rather the Rosherville Gardens, on the 2d inst. Dahlias were the prominent feature, and a fine display they made. We give the awards. Collections of 24: 1st prize, Mr. Turner, Slough; 2d, Mr. Bragg, Slough; 3d, Mr. Bennett, Dulwich; 4, Mr. J. Edwards, Holloway. Collections of 12: 1st prize, Mr. Turner, Slough; 2d, Mr. Hunt, Paddington; 3d, Mr. Bragg, Slough; 4th, Mr. Bennett; 5th, Mr. J. Edwards. Collections of 12 Fancies: 1st, Mr. Turner, Slough; 2d, Mr. Bragg; 3d, Mr. Hunt; 4th, Unknown; 5th, Mr. Bennett, Dulwich; 6th, Mr. Edwards. Collections of 6 Fancies: 1st prize, Mr. Turner; 2d, Mr. Hunt; 3d, Mr. Bragg; 4th, Mr. Bennett, Dulwich; 5th, Mr. Edwards. To give the names of the varieties exhibiting would be, for the most part, a repetition of those enumerated at the Royal South London Floricultural Exhibition, reported in another column. Mr Rawlings received a Certificate for his Seedling "Dr. Frampton," noticed in our account of the late meeting of the National Floricultural Society. 15 Miscellaneous Stove and Greenhouse Plants: 1st prize, Mr. Cole; 2d, Mr. Stanly. 6 Heaths: 1st prize, Mr. Cole; 2d, Mr. Stanly. Fuchsias: Mr. Stanly. Many other prizes of less importance were awarded.

## Garden Memoranda.

MR. MITCHELL'S, KEMP-TOWN, BRIGHTON.—The garden here contains about 5 acres within the walls; it occupies a cold bleak situation near the South Downs and the sea-coast, and is divided into squares by cross walls. In one of the Vineries there had been some well-swelled Black Hamburgh Grapes which had been remarkably well coloured; from long experience Mr. Mitchell has found that the art of colouring Grapes well rests entirely in judiciously admitting air when the house is opened, and he attributes his success solely to this system. The houses are mostly heated with common flues, and the Vine leaves were perfectly healthy and free from insects. In one of the Vineries an excellent second crop of Black Hamburghs was just beginning to colour. Muscats, except a late house, were all cut. Heliotropes and scarlet Geraniums cover the back walls, from which flowers can be gathered nearly all the year round, and half-hardy plants are wintered on the floors of some of the houses, which are paved with bricks for the purpose. Peaches on the open walls have borne no fruit here this year; and in some instances the trees themselves have been nearly killed. They are never summer pruned; the young shoots are permitted to grow out from the wall during the summer months, and are afterwards nailed and pruned at the same time, in the proper season, that being all the management they receive. The young wood is left untouched, in order to protect the fruit from the sea breeze. Some idea of the bleakness of the place will be gleaned when we state that dwarf Kidney Beans are protected in squares by hedges of Scarlet Runners, and tall varieties of Peas, which are secured by firm tying. A large bed of Fuchsia Riccartoni was one mass of crimson flowers, which it produces every year without more attention than that of cutting the plants down before frost comes, and covering the stools with ashes or similar protection. Some masses of mixed Verbenas were also exceedingly gay. A new Camellia house, having a north aspect, has lately been erected. In one half of it the large specimens are planted out in sunken brick tubs filled with prepared soil. They were moved into these last May, and the lifting has caused many of them to come prematurely into bloom. In the other half of this house there is a stage for young plants in pots. One or two greenhouses were gay with Balsams, the pretty blue Lobelia ramosa, scarlet Geraniums, and other summer occupants; and the place altogether was in excellent keeping, without a weed to be seen. On a north wall were some very fine Morello Cherries, which were fetching 2*s.* 6*d.* a lb.

## Miscellaneous.

*Death of Dr. Neill, of Edinburgh.*—We regret to announce the decease of this amiable gentleman, which took place at his residence, Canonmills, on the 3d inst., at a very advanced age. During a large portion of the past century he was the steady friend of gardeners and gardening; he was himself an enthusiastic horticulturist, and his writings on the subject possessed much merit. He was also a well-known British botanist; and we believe was the principal means of making the discoveries of the late Mr. George Don, of Forfar, known to the public.

*On the Direction taken by Plants.* By MM. Macaire and A. De Candolle.—In the number of the "Bibliothèque Universelle de Genève" for December, 1849, is a notice of Macaire's paper in the Philosophical Transactions for 1848, on the "Direction taken by Plants," accompanied by observations from Prof. A. De Candolle. Macaire had previously published researches on the Curling of Tendrils. In these new investigations he chiefly occupied himself with the tendency of the stem and leaves towards the light, rejecting the old explanation by a curling of the stem, as given by De Candolle and Dutrochet, and sought to make out whether or not light exerts an attraction. He placed some Duckweed in a longish glass vessel of water, covering one-half of the glass with black paper, so as to darken it, and then fixed a partition between the light and dark halves, reaching nearly down to the water. The Duckweed in the dark half was bleached, but did not change its position to approach the light. Peas, Beans, and Mustard-seeds were placed on little floats of cork in the dark part; they germinated and even flowered, the stem elongating towards the light, but the cork floats were not moved. When the stem projected above the partition, it took an upright direction and became green. Peas were placed upon floats in an upright glass covered with black paper, with only a single slit in it to give passage to light, also in a blue glass in like manner, but the floats did not approach the slit where the white light was very strong. Macaire's observations, according to which these experiments seemed to show that white light caused the production of rootlets on the side of the root turned towards it, and blue light on the side turned away, appear, from subsequent observations of M. Clos, to have been accidental phænomena, since the rootlets always shoot out in longitudinal rows, alternating with the fibres of the woody mass of the root. Macaire demonstrated the incorrectness of Dutrochet's assertion that the cause of the curvation is to be found in the modification of the endosmotic process by the influence of light; he also denies that heat exercises an influence on the endosmose, so that the ascent of water into an endosmometer filled with one and the same solution of sugar is equal at 65° and 10° Centigrade, if the expansion of the glass be taken into account. This leads De Candolle to propose that new and most careful experiments should be made, since he has observed that the endosmose goes on much more rapidly in an endosmometer kept in a warm room, and in summer, than at a lower temperature. Macaire further states that light has no influence upon endosmose; and since light and heat are such powerful promoters of vegetation, he concludes that endosmose is not an important operation in the growth of plants. He also does not believe that a fluid can rise by endosmose through several membranes. He closed the ends of three tubes of different diameters with bladder, placed them one within the other, filled them with syrup, and then put the whole into pure water, which only rose into the first tube. The same occurred in experiments made with other fluids, such as gum, alcohol, &c. De Candolle repeated the experiment, by filling with syrup an endosmometer, closed with double bladder, on the upper end of which was attached a bladder also filled with syrup, the whole being placed in pure water. At the end of four hours the bladder was distended, and not only had the water penetrated into this but into the tube, through the double bladder. Macaire has also confirmed the statement that the position of leaves depends upon light. When, for example, he lighted a leaf from below, and threw shade over the upper face, it turned round. He reversed twigs, and observed, as Bonnet did, a twisting of the leaves, remarking at the same time that in leaves which had the two surfaces of very different colour, the twisting was effected more quickly than in other cases; for instance, Bramble and Raspberry leaves twisted round in less than two hours. According to Macaire the twisting takes place sometimes in the blade of the leaf and sometimes in the stalk. Leaves of Lilac and Polemonium cæruleum twisted back by a spiral curling of the limb; leaves of Beans, the Raspberry, Chestnut, Maple, Geranium, and Cercis, by the petiole. If the same leaves were reversed under water and the petiole fastened in a hole, they turned over by the lamina. A leaf deprived of its stalk and laid upon water, the under face turned toward the sun, rolled itself together like a ball, to expose its under face to the light and hide the other surface. When the leaf was placed under water on a float the reversal was effected without displacement. Thus the light does not attract any part of the leaf towards itself. In order to try which of the rays of light were the agents in the production of this phænomenon, Macaire laid leaves under red, blue, green, yellow, and violet glasses, after having accurately determined which rays were actually transmitted through the glass. When only the red rays passed through, there was no turning over of the leaves; under blue glass, which transmitted also some red, and violet, which transmitted red and blue, the leaves turned over, more readily under the latter. Macaire also instituted experiments in order to determine the effect of light on the evaporation of water and the decomposition of carbonic acid. When the lower face of a leaf received light, the evaporation of water was stronger. With leaves of the Chestnut the difference in the two first hours amounted to a proportion of 13·6 to 11·2. As the leaf dried, the difference diminished and disappeared. Detached leaves with their stalks placed in water, and receiving their light on what is properly the under side, showed an evaporation twice or three times as strong as when the light shone upon the upper face. Hence why the turning over of the leaf is so injurious; it causes them to wither. Under coloured glasses the strongest action was with the blue, then with the violet and the green rays. Sometimes blue light produced stronger evaporation even than white, while yellow light always displayed less power. The decomposition of carbonic acid and excretion of oxygen only take place in cellular tissue which has not been disorganised. A leaf of a Rochea stripped of its cuticle and placed beneath water containing carbonic acid, evolved oxygen, which however scarcely came from the cells of the surface. An equal quantity of cellular tissue squeezed down and placed in like manner

under water did not give off any oxygen. Thus it is not the green substance, but only the organised cellular tissue which possesses the power of decomposing. When the epidermis remained this was stronger. Leaves hung up in bell-glasses filled with water containing carbonic acid, and lighted, sometimes upon the upper, sometimes upon the under face, the side of the bell turned away from the light being covered with black paper, gave off twice or thrice as much oxygen when they received the light, as usual, upon the upper side; and the difference became more and more evident the longer the experiment was kept in operation. When the leaves of Camellias are wetted, the stomates close; the evolution of air then takes place from the petiole, and the bubbles may readily be collected while arising from this part; experiments made with these showed that when the light was received on the upper side a quantity of bubbles came forth, while when the under side was illuminated very few were produced. Thus leaves which are lighted from below evaporate less water and decompose less carbonic acid. How this acts on the turning over of the leaves is still a mystery. The evaporation cannot act in this, for it is prevented under water, and yet the leaves turn round in such a condition. The excretion of oxygen is not arrested by the submersion of the leaves in water; this, as well as the revolution of the leaf, occurs under the influence of light. It must therefore be through the distention of the tissue by oxygen and the fixation of the carbon, that the leaves bend, curl or twist upon their petioles. The cause is evident, but we do not know how it acts. *Botanical Gazette.*

## Calendar of Operations.

*(For the ensuing week.)*

PLANT DEPARTMENT.

MANY of the plants intended for winter flowering have now filled their present pots, and are still growing fast; but unless they are very small, it will be better not to pot them again this season, but to assist them with occasional waterings of liquid manure. The size of the flowering pot must always be regulated by the purpose for which the plants are grown. In most cases, a supply of flowering plants is required for conservatory and drawing-room decoration; and as many of these will be required to fit various ornamental vases, it is necessary to practise the small shift system, by making the soil as rich as the plants will bear it, and keeping the pots as small as possible in proportion to the size of the plants; and should any further stimulant be required, it must be applied in the shape of liquid manure. These remarks, of course, apply to quick-growing things which are cultivated for a particular purpose, and are afterwards of very little moment.

FLOWER GARDEN AND SHRUBBERIES.

About a month since we recommended all those who are anxious to make the finest display of flowers next summer, to take notes of the most effective plants for the purpose, and of the habits and peculiarities of each. We would recommend that such a review be carefully repeated, and the present state of the plants noted also, marking particularly those which at that time made a creditable display, but which have now become shabby or indifferent. The object of going over them several times is to distinguish those kinds which commence early in the season, and continue in the greatest perfection to the latest period; that in future arrangements these may be generally if not exclusively used, to the rejection of all those whose beauty is short-lived. In making arrangements of this kind, it is not necessary to include an immense variety; as the symmetrical relationship between the parts not only admits of repetition, but demands that the corresponding parts should be similarly furnished. The object should be to make the *tout ensemble* perfect; and in almost every case this may be done best by a small selection. For example, if a gardener has of each distinct colour, and of the most useful intermediate shades, a few suitable plants of different heights, he may with proper taste make the arrangement of his masses as perfectly beautiful as a thing of the kind can be. The best way to proceed then is to make a list of desiderata, filling it up for the present with the things which approach most nearly to his standard, and substituting other and better things as soon as they come under his notice. One very important point to be attended to in the selection of plants for bedding purposes is the proper balance between flower and foliage, and especially amongst the bright warm colours; a mass of inflorescence is all very well in the distance, when the proper complementary colours also come within the angle of vision from the same point; but those flower-beds which are intended to please upon close inspection, must be plentifully interspersed with green foliage, to relieve the eye from the unpleasant sensation produced by gazing on an intense colour. We would wish to see the principle of methodical arrangement carried far beyond the parterre, that every clump of shrubs may give evidence of the reign of good taste, in the disposition of shades and colours. Many of the finest and most showy herbaceous plants are now in their beauty, and by studying the effect they produce in different situations, it is more easy to decide where they may be introduced with the greatest advantage. The dark masses of Rhododendrons and other evergreen shrubs, stand particularly in need, during the summer and autumn months, of some flowering plants, such as Phloxes, Aconites, Chinese and Noisette Roses, Hollyhocks, &c., planted amongst them; and the latter cannot be placed in a more favourable situation for displaying their charms, than with the deep glossy green of the Rhododendron for a ground colour.

FORCING DEPARTMENT.

PEACH HOUSES.—The trees in the early houses having matured their growth, the foliage is gradually falling off, notwithstanding the care that was taken to preserve it as long as possible. To prevent the littery appearance produced by the falling leaves, a birch broom should be passed gently up the branches every second or third day, to bring down all the leaves which are ready, that they may be removed, instead of being allowed to keep the house in an untidy state. As soon as the leaves are all off, the trees should be untrained, and the shoots washed over with a solution of sulphur and soft soap, taking care to perform both this operation and that of removing the leaves without injuring the young fruit or wood-buds for next year. The glass should be well washed, and the whole of the woodwork of the sashes and rafters either washed very clean or painted; the latter is of course preferable, if circumstances permit. The front trellis and the back wall should be painted with oil paint. All this may be done by the ordinary labourers, and is therefore not so expensive as at first might be thought, while it gives the house a respectable appearance, and effectually smothers every insect, in any stage, which may be lurking about the trees or their supports. As much of the effete soil as the roots will allow should be scraped away from the surface of the border, and replaced with fresh mellow loam, mixed with fine charred refuse, which all plants are fond of. No animal manure should be applied, as the trees can be stimulated to any required extent by using it in a liquid state during the growing season. The concluding operation will be to give the borders a good soaking of clean water, which will keep them sufficiently moist during the dormant season.

KITCHEN GARDEN.

Preparations should now be made for planting out the young Cauliflowers raised last month. A shallow trench should be formed sufficiently wide to receive the hand-lights, removing the soil to the depth of about 6 inches, and laying it on the edges in a similar manner to a Celery trench. The bottom should then be manured and dug, and spaces the size of the handlights marked out, planting only every alternate space, and reserving the intermediate ones for setting the tops of the hand-lights upon when not required over the plants. The strongest of the young Cauliflowers should then be planted about 4 inches apart, and the handlights, having first been put into repair, should be placed over them. The tops, however, should never be left on, except in case of frost or heavy rains, and even in the latter case air should be admitted. Early Celery should be earthed up as required, but the main crop must still be deferred till it has arrived at its full growth, as there is yet time. It is scarcely necessary to say that fine weather should be chosen for this operation, and that the soil should be as dry as can reasonably be expected at this season.

State of the Weather near London, for the week ending Sept. 4, 1851, as observed at the Horticultural Garden, Chiswick.

## Notices to Correspondents.

BALSAMS: *F B H.* If you do not allow your plants to expend their strength in forming flowers, they will do so in forming shoots. The removal of a few flower-buds strengthens others; but that is very different from destroying all the flower-buds.

BEANS: *J H G.* We do not recognise the variety from description. Can you furnish us with a specimen of it? ‡

BEES: *Ravenswood.* The only mode of getting rid of the wild bees will be by unroofing the place, removing the honey and combs, and destroying the bees, taking care in replacing the roof to leave no holes for any bees that may escape to return to. It is next to impossible to "seduce them into hives." *Y.—S L.* A thatch of straw or reeds over the weather boards would be the best for the purpose. It is not desirable to have so many hives in such close proximity as your present "bee-house" will hold; if you could conveniently divide it into two it would be better. Your aspect (south) is not proper. West, by south or north (the latter to be preferred, if equally convenient), is far better. *Y.*

BIRDS—THE FLY-CATCHER: *Sarah K.* This is a sprightly, graceful bird, when at liberty; and you may well be delighted with the rapidity of his movements. Although so tame, on no account take possession of his little person. If immured in a cage, his death would be the penalty paid for his confidence in your friendship. These birds are purely insectivorous. *W. K.*—THE NIGHTINGALE: *J L.* The value of the birds you describe is, at this season, about 7*s.* each. You could not purchase at a better time. *W. K.*—THE BLACKCAP: *J B.* We have, at your earnest solicitation, selected for you a bird and cage. The former is a young gentleman of good promise, and will, we trust, do honour to our judgment before Christmas. He waits your directions as to "how and when" he is to be forwarded to you. Mr. CLIFFORD will take charge of him in the interim; write him all the particulars. *W. K.*—THE CANARY: *Amanda.* The cause of your bird so disfiguring himself, by picking out his feathers, and showing so many symptoms of uneasiness, is the red insect you speak of. This terror of all chamber birds has taken up its residence in his cage; and at night it creeps forth, to prey at leisure upon his devoted person. At once *destroy* the infected cage,—unguents and detergents are of little avail in such cases as these. Let the *new* cage be made on the model already recommended, and of mahogany. None of these *Thugs* will then force themselves in, and your bird will speedily recover. Before removing him into his new quarters, take him carefully in your hand; and by blowing gently on his feathers (below the breast) you will soon discover if there be any latent enemy. It there be, the point of a fine needle will assist in his ejectment. *W. K.—G B.* Your bird has either injured his leg by straining it between the wires of his cage,—or he has the cramp. If his claws be of an undue length, we imagine he is suffering from the former. In such case, with a pair of sharp scissors, remove the cause of offence, being careful not to cut *too* closely. If he has the cramp, keep his cage covered over, and remove him to a warm situation. To remove the constipation, give him immediately a small portion of finely-scraped raw beef, moistened with water; or some warm boiled milk. He will soon rally, and the raw beef will accelerate his return to song. When he is better, let him fly about the room for an hour or two. These birds like exercise, and love to bask in a sunny window. *W. K.*—SONG BIRDS GENERALLY: *C P.* We will give due consideration to your proposition. At present, all is in good time. You cannot do better than read our remarks carefully, in their serial form, from week to week. Directions for the destruction of RATS and MICE, in aviaries, have been minutely given in the early numbers; as you will find on reference. *W. K.*—GOLDFINCHES, &c.: *J C Ewan.* Feed your young birds on bruised Hemp seed, Canary and Flax, for the present; also give them some of the GERMAN PASTE recommended last week. Leave off giving them Hemp seed altogether, in another month, gradually; and confine them to Canary and Flax seed only. Feed them yourself; and if you hang them up in a quiet place, they will soon become familiar. We shall have to treat on "BREEDING GOLDFINCH MULES" long before you will require the information sought for. Your Goldfinches will *not* be injured by the company in which you propose to place them. Quite the contrary. All the back numbers are at present in print, and your other request has been attended to. *W. K.*

BOOKS: *A Rural Dean.* We do not understand what is meant by "gardeners' flowers." Pray enlighten us.—*Sub.* No work can enable you to identify fruits by description only. Lindley's "Guide to the Orchard" is the best.—*D C.* If you will refer to page 520 you will find that your question has been answered. ‡

FAIRY RINGS: *A Sub.* These are caused by the underground spawn of fungi—usually of the Agaricus oreades. The spawn spreads regularly from a centre, and produces fungi at the outside of the circle thus formed. By degrees the circles wear out or become blended together. We know of no means of destroying them without also destroying the Grass itself.

FOREST TREES: *R F.* You had best transmit seeds. Gather them as they ripen, dry them well in the sun, and send them loosely in canvas bags. ‡

GRAPES: *J F.* There are many sorts of Hamburgh Grapes, differing in colour, quality, &c. It almost always happens, however, that what are called Red Hamburghs gain their red colour *either* because they have not air enough, *or* because their roots are too deep. Vine roots should always be near the surface. But their being near the surface may itself be injurious, unless means are provided to keep off cold rains and frost. In dry ground frost does them no harm; but in water-logged ground it is highly injurious. Vines *must* be rested somehow.—*W H.* You must maintain a high temperature during the day, or they will not ripen with you. Let it fall at nights ‡

INSECTS: *P J N.* The large caterpillar is that of the common elephant hawk moth, Deilephila Elpenor. *W.—S S.* The grubs in your kitchen garden are those of the common cockchaffer, Melolontha vulgaris. We know of no better plan of destruction than to dig up the ground and collect the grubs; or of prevention than by employing children to catch and kill the beetles when they appear in numbers in the summer. *W.*

KALMIAS: *S H F.* They are propagated by layers or by seeds. The seed should be sown as soon as ripe in peat and sand, under a north wall; the seeds should be mixed with the sand and scattered over the peat. Hand-glasses should be placed over the place. They *may* be struck from cuttings, in which case they must be treated like Heaths and other hard-wooded plants.

LILIES: *N M.* You must replant them. ‡

MUSHROOMS: *Cymro.* It does not matter, so far as Mushroom growing is concerned, how you feed your horses. The droppings will be equally available for that purpose, whether they are fed on hay or on corn and Grass. ‡

NAMES OF PLANTS: *Inquirer.* Yes; it appears to have been growing in a warm place. *S.—R S.* 1, Pteris aquilina; 2, Polystichum lobatum; 3, Polypodium vulgare; 4, Asplenium Adiantum nigrum; 5, Scolopendrium officinarum. *S. —G Bloon.* It is the common state of the Chilian Potato, and is regarded as the first stage of the plant from a state of nature. It is well known, and of no value, except as a curiosity.—*F Masters.* We never heard of the plants you mention. Depend upon it they are either in cultivation or not worth cultivating.—*F B.* Pancratium maritimum; the Sea Moss, is not a plant, but a conglomeration of animal spiculæ of some sort.—*Alpha.* We cannot name specimens having neither flowers nor fruit.—*Jungermann.* Nostoc commune.—*B L.* Ditto. The cause of its appearance here and there is unusual dampness and shade.—*E J T.* 1, Sedum Telephium; 2, Daucus Carota. *E K L.* Eupatorium cannabinum.—*A B.* 1 and 2, Pinus hispanica; 14, judging from the morsel sent, is the same thing, with sharp pointed buds. The compact habit of the plant may be induced by soil or situation. ¶—A few inquiries stand over for further consideration.

RATS: *W D, Z, A C,* and a host of other "Anxious Enquirers," have our very best sympathies in their respective cases of cruel grievance. They will have their wishes complied with next week. *W K.*

SCARLET RUNNER: *W N.* Very large and tender. ‡

STRAWBERRIES: *Constant Reader.* We believe that the Downton Pine may be obtained, true, of Mr. Page, Nurseryman, Southampton.—*N M.* The Alpine is the very latest, and may possibly answer your purpose. ‡

WEEDS: *J B H.* Lime will not kill Coltsfoot, but encourage its growth. If the soil is shallow and gravelly, you can extirpate it by repeated forking. The best time of the year for cutting Ivy from a wall, so as soon to sprout out again, is the month of March.

SEEDLING FLOWERS.

ROSES: *Anon.* Your Rose is certainly a fine variety, but we are overdone with rose-coloured Bourbons; if it had been scarlet it would have been worth a little fortune: it ranks among the finest of the rose-coloured Bourbons, and will, perhaps (although doubtful), increase in size when budded.*

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS, AS THE ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

THE LONDON MANURE COMPANY beg to offer, as under, CORN MANURE, most valuable for spring dressing—Concentrated Urate, Superphosphate of Lime, Nitrate of Soda, Sulphate of Ammonia, Fishery and Agricultural Salts, Gypsum, Fossil Bones, Sulphuric Acid, and every other Artificial Manure; also a constant supply of English and Foreign Linseed-cake. Peruvian Guano, guaranteed the genuine importation of Messrs. A. Gibbs and Sons, 9l. 10s. per ton, or 9l. 5s. in quantities of 5 tons and upwards.

EDWARD PURSER, Secretary.

40, Bridge-street, Blackfriars, London.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Clover Manure, per ton ... ... ... ... | £11 | 0 | 0 |
| Turnip Manure, do. ... ... ... ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per ton, in dock. Sulphate of Ammonia, &c.

SHALE MANURE.—The Bituminous Shale Company can now SUPPLY PULVERISED SHALE ASHES in sacks, at 2l. 10s. per ton, delivered at any station or branch line of the South Western Railway, and at the Terminus, Nine Elms.

This valuable Manure is at once cheap, durable, and fertilising, and will be found to be superior to all others for Grain, Grass, and root crops.

A singular property of this Manure is that it entirely prevents the ravages of the fly in Turnip. It is also utterly destructive of the wire-worm.'

Orders to be addressed to the Bituminous Shale Company, 145, Upper Thames-street, London, where also testimonials from the first agriculturists of the day may be obtained.

ALGERNON POLLOCK, Secretary.

Respectable Agents Wanted in the country. Reference to a Country Banker or London House, required.

MR. J. C. NESBIT, F.C.S., F.G.S., Consulting and Analytical Chemist, Laboratories, 38, Kennington-lane, London.—PRIVATE INSTRUCTIONS in Chemical Analysis, and the most approved methods of making ARTIFICIAL MANURES. Analysis of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

HOSE FOR LIQUID MANURE, Fire-engines, and agricultural purposes, made of canvass, lined and coated with gutta percha; it is about one-third the price of leather or india-rubber, will convey liquids of all kinds under a heavy pressure; it is extensively used at the Government public works, also by the navy, and amongst agriculturists, giving universal satisfaction. Testimonials and prices may be obtained of Messrs. Burgess and Key, 103, Newgate-street, sole manufacturers.—London Agents: Messrs. Deane, Dray, and Deane, Swan-lane; Messrs. Tilley, Blackfriars-road.—Country Agents: Messrs. Ransome and Parsons, Ipswich; Messrs. J. and S. Johnson, Liverpool; Messrs. Dickson, Hull; Mr. S. Wilson, Agent for Scotland.

ANTHONY'S PATENT AMERICAN CHURN has obtained a Prize at every Agricultural meeting at which it has been exhibited; and the Proprietors have sold upwards of 2000 in one year, and received from all parts of England the highest testimonials in its favour, both as to the short time required, the quantity and quality of the Butter made, a copy of which testimonials, with prices, will be forwarded on application to BURGESS and KEY, 103, Newgate-street, Sole Agents to the Proprietor.

FOR WATERING GARDENS, DISTRIBUTING LIQUID MANURE, BREWERS' USE, &c.

PATENT VULCANISED INDIA-RUBBER HOSE-PIPES AND FLEXIBLE GAS TUBING.

JAMES LYNE HANCOCK (sole Licensee and) Manufacturer, Goswell Road, London.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, for portable Gas Lamps, and all purposes where a perfectly sound Waterproof and Flexible Pipe is required. Hot Liquors or Acids do not injure them; they are, therefore, much used for Chemical purposes, as they require no oil or dressing when out of use; are particularly suitable for Fire Engines, and are found exceedingly useful in Dwelling-houses for conveying Hot or Cold Water to Baths, &c.

Testimonials and prices may be had on application to the Manufactory.

N.B.—Vulcanised India Rubber Garden Hose, fitted up with Roses, Jets, and Branches complete, with union joints ready to attach to pumps or water cisterns.

All Letters or Orders addressed to J. L. HANCOCK, Goswell Mews, Goswell Road, London, will meet with immediate attention.

Waterproof Fishing Boots and Stockings, Portable India-Rubber Boats, Shower and Sponging Baths, Air Cushions and Beds, made all sizes to order.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description; but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected on the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

DURABLE OUT-DOOR PAINT.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the Nobility, Gentry, and Clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-poor Paint ever invented, for the preservation of every description of Wood, Iron, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice. Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON and SON, No. 9, Great Winchester-street, Old Broad-street, Royal Exchange, London. No Agents.—All orders are particularly requested to be sent direct.

THE METALLIC PAINT, produced by the Patent Alkali Company, has been extensively used for several years on farm-buildings, iron bridges, roofs and railings, shipping, &c., and it is admitted that it covers a greater surface and stands far better than any other pigment on wood, iron, Abethaw Lime, and Roman Cement. Fine Black, 25/. per ton, and Rich Purple-brown, 20l. per ton.—Offices of the Company, 1, New Broad-st., London.—JOHN A. WEST, Secretary.

MANCHESTER AND LIVERPOOL AGRICULTURAL SOCIETY.

President for the Year—The Right. Hon. the EARL of WILTON.

The ANNUAL SHOW of Cattle, Implements, Seeds, Vegetables, &c., will be held at MANCHESTER, on TUESDAY, the 7th of October, on a commodious plot of land near the Stretford New-road, in Hulme; the land is well walled round on all sides, is upwards of three acres in extent, and belongs to Samuel Brooks, Esq. The trial of Land Implements will take place the day before the Show, in a field near the Show-yard.

PRIZE LISTS containing the Rules of the Society, Regulations for the Show, &c., may be had by applying to the Secretary, or to the Collector of Subscriptions for the Manchester district, Mr. Wood, 23, Princess-street, Manchester.

Warrington, Sept. 4. HENRY WHITE, Secretary.

*SATURDAY, SEPTEMBER* 6, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

THURSDAY, Sept. 11—Agricultural Imp. Soc. of Ireland.
THURSDAY, — 18—Agricultural Imp. Soc. of Ireland.

THE atmosphere is composed chiefly of oxygen, nitrogen, and carbonic acid, in mechanical mixture. Recent discoveries have added ammoniacal vapour. It is generally admitted that these gases, and water, are the primary elements from whence the whole mass of vegetable and animal matter on the surface of the earth has been formed. The relative proportions of these gases in the atmosphere are not subject to much change. The opposite functions of animal and vegetable life maintain the equilibrium, with the aid of the natural forces of combustion, putrefaction, and decay. Aqueous vapour is another constituent in the atmosphere which affects the whole range of circumstances that influence vegetable growth. Unlike the permanent gases, it varies greatly in amount in the various seasons and countries over the globe; from its peculiar properties it is liable to be deposited by changes of temperature, and thus it is the means of spreading fertility over wide continents which, without this continual circulation of water, would be arid wastes. It was long supposed that the gases of the atmosphere had the power of dissolving water, but DALTON demonstrated, in the clearest manner, that water in the invisible state existed as a gas, and possessed all their physical properties, so long as the temperature at which it was at first given off was maintained. Aqueous vapour can exist in the elastic state at all temperatures, and mixes and diffuses itself amongst the other gases by virtue of its particles mutually repelling each other, in the same way as they would act in a vacuum. Air does not dissolve water, but water can dissolve a small quantity of all the gases in the atmosphere when it loses its aeriform condition. The amount of vapour which can exist in the air is regulated by the temperature. When the heat of the air is lowered to 20° it is still capable of maintaining about 1½ grain of vapour in a cubic foot, but when raised to 80°, rather more than 10 grains. In both these cases the air is said to be saturated with moisture, because the constituent temperature of the vapour and the temperature of the air correspond. If a reduction of temperature takes place, in either case, part of the vapour would be precipitated.

It is well known that all fluids absorb a large amount of heat when they assume the gaseous state, but which they again give up when reduced to fluidity. Water evaporates very slowly, and takes heat from all bodies which are in contact with it; but when its vapour mixes with the atmosphere, it acts as a reservoir of heat, because the temperature of the air cannot sink below the dew-point of the vapour without freeing a large amount of latent caloric. In this manner the humidity of the atmosphere in a great measure regulates the night temperature. The mean minimum temperature and the dew-point of the vapour coincide pretty closely with each other. For some time we have suspected that the markings of the register thermometer would convey a pretty accurate test of the hygrometry of most countries at a short distance from the sea. However, we find that we have been long anticipated in this relation in an elegant paper by the late Dr. ANDERSON, in the 14th volume of the "Edinburgh Philosophical Transactions," to which we refer those who may be curious in these matters. It appears rather singular that this paper should have got so long out of sight: we are glad to see that Dr. FLEMING has so far disinterred it, the other day, in his admirable little volume on the "Temperature of the Seasons."

It is in consequence of the large amount of moisture with which our south-west winds are laden, that our winters are often so mild. The sun has little power of heating them during the short days, but the long nights have as little power in cooling them by radiation. When the moisture extends to a considerable height in the atmosphere it is remarkable to observe how a high dew-point of the vapour suspends the night temperatures when the sky is without a cloud, and the dews of January may then fall as fresh as those of June.

But it is the greater proportion of moisture in the air during the summer season that allows the night temperatures, as a general rule, to increase in our latitude with the increase of the day heats. Heat and humidity thus act and react on each other; because, however high the thermometer may rise through the day, the surface of the ground and lower strata of the atmosphere will rapidly transmit their heat into space as soon as the sun sinks below the horizon, and this reduction of temperature will only be checked when the dew-point begins to be reached. As an extraordinary instance of the rapidity of the loss of heat in the absence of the sun, it is recorded that the shade thermometer sunk 5° at Koningsberg during the short period (three minutes) that the sun was totally eclipsed; it could not have sunk a single degree had the air been saturated with moisture. In all countries, however hot the days may be, the nights will be cold in proportion to the dryness of the atmosphere. For this reason France and Italy are very subject to spring and early summer frosts, when the air is dry. In other countries much nearer the Equator, Egypt, Palestine, India, &c., during certain seasons the nights are cold when the air is deficient of moisture. Mr. INGLIS, in his interesting tour through Spain, remarks: "I could not but observe the remarkable changes of temperature to which Granada is subject. Walking up the sunny side of the mount, I many times blessed the friendly shade of the Prickly Pear, and the enormous leaves of the Aloe, so scorching was the sun; and yet, under the wall, on the shaded side of the mount, the hoar frost was lying; and this same evening, I found it so cold in the hotel that I drank tea, and received some visitors in bed."

The moisture in our atmosphere is the only protection that we have, which prevents the temperature during summer or winter sinking to the freezing point every night. This aqueous atmosphere is generally confined to a very limited range in our sky. In the more northerly parts of the island, its cloudy plane of precipitation appears like a good umbrella over one's head, when contrasted with the loftier expanse which it occupies in the lower latitudes of the sunny south. Frosts break into the midst of our summers when this element is deficient, for it is then that

> **The parching air burns frore,**
> **And cold performs the effects of fire;**
> **Hoary-headed frosts**
> **Fall in the fresh lap of the crimson Rose.**

A remarkable instance of summer frost occurred in the early part of July last, which was felt over the whole of the eastern and northern parts of Britain, and it may not be out of place to record its effects on vegetation. The last days of June were very warm, and the thermometer stood at 80° on the 1st of July; the wind changed to the N.E. on the 2d, and towards night the air became remarkably dry and parching; shortly after midnight the thermometer sunk to 32° in the shade, where it stood till sunrise. A thermometer exposed on the Grass marked 21°. On the 3d, the sun shone out through the day, without a cloud, but the maximum shade temperature did not rise above 61°. From the dryness of the atmosphere, one could anticipate another night of frost as a matter of physical certainty. Accordingly the thermometer again made its minimum at 33°. We observed the top of the Furze scathed as with fire in hollow situations on the heaths of Suffolk, and the Potatoes were considerably affected in many situations through the eastern counties. In Lancashire and Cumberland, the Potatoes in the valleys were also blackened. Over the whole extent of Scotland the frost was severely felt, and caused a vast amount of mischief to the growing crops in hollow and basin-shaped localities, where the air readily became stagnant and cooled down. In such places, the Potato stems were completely killed to the ground, and hundreds of acres of grain crops, Turnips, &c., were destroyed. In the latter cases, a few circumstances seemed to influence the destructive effects of the first. Grain crops were only in-

jured on weak mossy soils, or where the subsoil was irony and unfriendly to vegetation. The dry state of the ground when the frost occurred, as well as the dry and exhausting droughts which succeeded, seemed to have been so far prejudicial to the crops. When the soil was somewhat open, dry, and mossy, the destruction to the green Oats was complete; they literally "rotted ere their youth obtained a beard." But where they had a plentiful supply of moisture at their roots, they escaped uninjured. Young Turnips which were ready for the hoe were altogether destroyed on moss, but did not suffer in the least on clays and good gravels. As a curious instance of crops being constitutionally weak, where they are grown under certain conditions, whereby their vitality and vigour may be impaired; but, at the same time, they may fulfil the required ends of the cultivator, except in instances as the present, where such severe trials make the weak go to the wall. On a field of 16 acres of mossy land, which was all dunged with farm-yard manure in autumn, and ploughed in, a coating of siliceous gravel was applied over one-half of the field. The whole was sown in the end of May, with Rape, and a fine equal plant was obtained, which almost covered the land by the 1st of July, but the frost killed every plant where the ground was not dressed with gravel, while the other half of the field escaped with very little injury. Could a mineral manure not be got to supply the place of the gravel?

It has been our object, at present, to draw attention to the influence of the amount of moisture in the air, so far regulating the night's temperature, as to afford an easy and pretty correct estimate of the hygrometry of our seasons, by observing the lowest depression of the thermometer. Owing to the continual variation of the winds, this is liable to many exceptions, when individual instances are taken. We have known the moisture of the air vary 36° within 12 hours in winter; but in general, if the dew-point is taken during the maximum heat of the day, the minimum range of the thermometer will be anticipated for the succeeding night if the wind does not change. A protected thermometer will generally fall about 2° lower than the mean dew-point. *R.*

## REPORT ON THE AGRICULTURAL SECTION OF THE GREAT EXHIBITION.

No. XV.—Appold's centrifugal pump, which keeps up such a continual cascading in Class 6, is well adapted for the purpose of draining fens and irrigating flat land. We do not anticipate, however, that it will quickly supplant the scoop-wheel, for the duty performed by this pump is 70 per cent. of the power employed, scarcely equal, we believe, to the duty effected by the best fen scoop-wheels. But still its cheapness, simplicity, and extraordinary lightness are great points in its favour; and we should not be surprised if, after a time, the wheel, 2 or 3 feet in diameter, spinning at a rapid rate, with but little friction, should be found preferable to the massive wheel of 30 or 40 feet diameter, slowly circumvolving with many tons weight of water bearing upon its axle. In this pump the water rises by the momentum it acquires from passing through a rapidly revolving drum, divided by radial blades, just on the same principle that wind is urged by the fan of a winnowing-machine. As there are no valves in action, this pump is not liable to wear or derangement from sand, mud, or other matter in the water. It is, therefore, well calculated for raising the waters from stagnant drains. It is particularly well adapted for a tide pump; that is, when the "head" of water in the receiving river varies considerably at short intervals. Of course the higher the lift the less quantity is raised by the same amount of power; and in order to regulate the power of the engine to the height of the tide, where the fen waters are raised into a tidal stream, requires both constant attention and considerable delay. In some cases lift pumps are obliged to be employed, although inferior in general efficiency to scoop-wheels; or if the latter are used, two trains of gear-work are necessary in order for the engine to do its full duty, the wheel being thus turned slowly when the head is high, and quickly when it is low. But the centrifugal pump regulates itself; it preserves the same speed, no matter what may be the variations in the height of the head, always allowing the engine to exert its full power, though, of course, raising more or less water, according to the elevation to which it is lifted.

A pump in Class 5, Gwynne's patent balanced centrifugal pump, recommended by testimonials from America, professes to out-miracle Mr. Appold's. Its principle is essentially the same; but the duty it performs, according to the exhibitor's hand-bill, is equal to 90 per cent. of the driving power. We do not understand the items given respecting its capabilities. The bill states that 84 horse-power, with one of these pumps, will raise 10,500 gallons of water 30 feet high in one minute; whereas, according to the usual calculation 84 horse-power can raise only 9240 gallons to that height in that time; so that, instead of the duty being 90 per cent., this statement makes the engine do more than it possibly can. Again, the bill says that with 7 horse-power 1500 gallons have been raised 22 feet in one minute; but, according to the general notion, that a horse's power means 33,000 lbs., raised 1 foot high in one minute, and that 1 gallon of water weighs 10 lbs., it would require 10 horse-power to lift 1500 gallons to the height stated. There seems to be some mistake; we should like to have it explained.

Class 16. Leather, saddlery, and harness; skins, fur, and hair, contains objects of importance to the farmer; and our cart harness, generally speaking, needs improvement.

Class 21. Cutlery, edge, and hand tools, exhibits many specimens of improved tools for agricultural purposes; but we close, for the present, our task of inspection, merely mentioning that, in other classes beside the manufactures from glass, gutta percha, &c., the farmer may find many new things calculated to assist him in his lesser labours. We must not forget to name the models which are to be seen here and there, such as that of Danhill's design for a suburban metropolitan cattle market, with accommodation for 6000 oxen and 40,000 sheep; Spurin's model farm, Mechi's farmstead, and others in which all the machinery is shown in motion; and likewise Mr. Dawn's model of a Somersetshire decoy for entrapping wild fowl.

In conclusion, we remind our readers that we have done little more than describe the more interesting of the English implements and agricultural machinery; our animal and vegetable productions have received but a scanty criticism, and all the foreign and colonial implements and products remain yet to be noticed at some future time. *I. A. C.*

## THE POTATO CROP.

In the counties of Longford, Leitrim, Cavan, and Westmeath, the Potato fields are now very generally blackened, and it is a very common complaint that the disease is extending to the tuber, with greater rapidity than it did last year, having respect to the time of its appearance on the leaf. The leaves seem to be more withered than in former years, before the blotches appeared on the stems; yet the peculiar smell of the fields is as powerful as ever, a positive indication of disease.

To Ireland, there is not a more interesting subject of discussion than the fate of the Potato; her whole well-being, her only hope, rests on the recovery of it, or in such an extension of its culture as will restore to her the ability to export 12 or 13,000,000*l.* worth of produce, as well as render her independent of foreign supply, for the food of her people. It is sheer folly to talk of her losing her dependence on it; she must depend on it, and, bad as her expectations may be from it, it still constitutes her only, her forlorn hope; her perseverance in the culture of it is not the desperate resource of the gambler—it is the noble, hopeful, continued energy of the sailor in the storm and the tempest—it is his longing look for the clearance of the clouds, and the cheering sight of the sun.

And this hope will not be vain. It is in the very nature of an epidemic, to be of only temporary continuance. It is in the very nature of all abnormal production to sink back to its original normal amount, when that which conduced to its increase has ceased to operate. It is in the very nature of all excessive force to exhaust itself. We lead nature into magnificent, beautiful monstrosities if you please, but vast enlargements; we remit our attentions, and these artificial developments fall back to their original insignificance—if Nature, in any of her works, can be insignificant.

We have the authority of the wisest that there is nothing new under the sun; we have no right to suppose that since the day of the present creation aught new has been brought forth. The seed of the Potato fungus must have existed since first was recorded the sabbath of the great Creator; and whether its present vast development arise from extraordinary influences of the fluids of our atmosphere, or whether from any predisposing susceptibility in the Potato, whether it be a cause of decay or a feeder on vitiated sap, it may be expected that, ruled by those conservative laws which, steady in their course, govern the ever-varying modes of created matters in their march, its present exuberance will become reduced to its ordinary innoxious condition.

In the consideration of the probabilities of the continuance of this disease, we are not, however, confined to our knowledge of the usual course of nature; the ever changing features of the disease in its progress give us a reasonable expectation that the Potato will not prove an exception in the rule of general conservative Providence, which, hating nothing that it has made, has never allowed aught that it has created to perish. For seven long years the grain crop of Egypt and of the land of Canaan, possibly of all Asia, of all the then inhabited portion of the globe, was not. In modern times the grain crops of Europe have been as deficient as the Potato crop now is. The Turnip crop is frequently more destroyed by the fly and droughts, and now the diamond moth has began ravages which may be continued and extended in future years to its total destruction. An insect unknown before to feed on vegetable products, either from a deficiency of its usual nutriment in the soil or from some other cause, has been taught to feed on Mangold Wurzel—my ducks from being accustomed to feed with young turkeys on food in which green vegetables largely entered, when turned into the garden no longer sought for slugs, their usual animal food, but destroyed my young Peas and my Lettuces. The earlier sown Wheat has, in Ireland, for the last three or four years, been so deficient, from not filling, as to induce many to discontinue it. Yet are we to abandon the culture of all these crops, or be stigmatised as reckless gamblers? An Englishman, a Mr. Alsop, some years ago steward to the Marquis of Thomond, told me he got four quarters and a half of Wheat on middling land, and that if he had other land in that neighbourhood he could obtain five and a half quarters from it, and such products do not appear uncommon, after Potatoes. On old Grass land, two years ago, a magistrate in this neighbourhood had 7 quarters to the acre, on about two acres of land. From the neighbourhood of Portumna, in the county of Galway, I have seen a sample of brown-chaffed white Wheat far exceeding my imported English seed. Yet we have been congratulated on a diminished breadth of this crop in the last year, as being unsuitable to our humid climate.

The progress of the disease is favourable to a belief of its eventual discontinuance. It has been changing from the first; in the year 1845 the crop, an abundant one, appeared uninjured (at least no indication of disease was observed in the leaf and stem) until it was stored, when almost the whole of the Potatoes rotted. In the year 1846, far less abundant in tubers than in 1845, the leaves and stems decayed very early, the tubers rotted in the ground and generally when stored, and those that survived were excessively deficient in flavour. From that year to the present, though the leaves and stems have prematurely decayed, with all the signs of disease, yet the tubers have suffered less, been more abundant, and have progressively improved in keeping and in flavour; indeed, those that have arrived at maturity, or nearly so, have now recovered all their former gratefulness; and although the regularity of the annual alternate late and early appearance of the disease may be indicative of a lengthened continuance, it is not unfavourable to a belief of its eventual disappearance, for it furnishes a sufficient proof that it is produced by some external causes, and not by a constitutional depravity in the Potato. This latter has been fondly supposed and unwittingly attributed to a too stimulated growth, while a high abnormal development of all other vegetable, as well as animal productions, is not supposed to bring similar results, and when the disease has been universal, while the means of forcing a large production has been restricted to a few favoured countries. In Ireland, where, comparatively to the breadth of Potato culture, little stock was kept, and that stock wholly depastured, much of it even through the winters, and no artificial manure employed, nor oil-cake, nor meals used for feeding, the manure little else than rotted straw and bog mould, no over luxuriance, no excessive stimulation could have vitiated the plant. Neither can improved tillage of the Potato have produced here any mitigation of disease, for its tillage and treatment has continued precisely the same as heretofore.

The Potato is not more appreciated in Ireland than it ought to be, and we are not therefore to be surprised that the continuance of the disease is met with general wailing. It was in the fulness of the crop that the small farmer expected to render the rest of the produce of his farm available to the other demands upon him; he could grow nothing else to effect this purpose. It was in the fulness of the crop that the labourer expected the stronger farmer would have the means of employing him; he has no other. The resource of all is now to seek across the Atlantic a future existence in labour, or in the employment of the little capital they can rescue from a general ruin which they knew not how otherwise to avoid. What think you? The amount of this years' poor rate in one electoral division (Scrabby) of the Union of Granard—Granard is not in Connaught, but in Leinster—amounts to 17*s.* in the pound, while in another (Mullahoran) it is 9*s.*

But in our disappointment are we to abandon the culture of a vegetable most closely approximating in its qualities to a cereal production, because its yield is not so great as it would be were it not subject to this disease, which still exceeds, in its most deficient state, in food value any of our cereal crops, while it doubles them in money value.

For the last three or four years the Potatoes saved have on an average exceeded half a crop, they have amounted to it in the worst of these years. A half crop of well tilled Potatoes, at the average market prices of these years, was worth 16*l.* the acre. It is a very prime acre of Oats that would bring 5*l.* A half crop of such Potatoes would give an amplitude of food to a man for 640 days. Such an acre of Oats would not feed him for more than 450 days. Supposing by increased production the market value of Potatoes were reduced one half, which would be somewhat near their value before the appearance of the disease, the acre would be worth 8*l.*

But with increased production we should revert to the conacre system of paying labour, which, while it afforded a great facility to the employer in paying the labourer, and consequently enabled him to employ to an amount now unthought of, gave to the labourer an equivalent to near double the amount of his present wages. The common price at which the manured acre of land for Potatoes was let was 5*l.*; this he laboured on spare hours, and valuing its produce even so low as 8*l.*—I have sold an ordinary good acre for 12*l.* in the ground—he would have a profit of 3*l.*, together with about 2*l.* for a pig fed on the refuse.

It is, then, the yet limited cultivation of the Potato that keeps us poor. We should make up in the breadth of land under the crop the deficiency of acreable produce; it would then, in spite of the disease, still constitute the cheapest as well as the best food of

the labourer, one on which he can work hard without the stimulant of strong drinks, and which, in its inherent moisture and mildness, does away even with the necessity of weaker drinks, for there is no doubt that a man living exclusively on Potatoes requires very little, if any, drink. A labourer of mine some years ago assured me that he frequently never drunk anything for a week together, not even water. It is also a common assertion that hunger does not so soon come on again after a meal of Potatoes as after one of Oatmea lporridge.

Again, it is no contemptible proof of the value of the Potato that, in the much vaunted report of the farm of Auchness, the result brought about so favourable to the views of Mr. Caird were in consequence of, and wholly dependent on, the very great and disproportionate breadth of Potato tillage on that farm, and the high acreable value of this crop. *J. M. Goodiff, Granard, August* 29.

## THE SUGAR BEET.

In a late Number of the *Agricultural Gazette* you have inserted an article on the proposed manufacture of Beet Sugar in Ireland, such article being founded on the paper read by Professor Hancock, at the meeting of the British Association. Dr. Hancock was bent on *writing down* the movement, and his remarks were chiefly directed to Mr. Sullivan's pamphlet, the statements in which, by a one-sided effort, he sought to controvert. As you have given the substance of Dr. Hancock's remarks, you will of course, in a spirit of fair-play, give Mr. Sullivan's reply, a copy of which I herewith enclose. When I tell you that the crops of sugar Beet now growing in Ireland far exceed in luxuriance those of Mangold Wurzel, you will admit that the prospects of the manufacture in Ireland are not what Dr. Hancock seeks to represent them. Some existing interests here will be affected by the production of indigenous sugar ; and hence the secret of the opposition which has been raised in certain quarters against it. As you can of course have no object in view but the dissemination of truth regarding it, I feel assured you will readily give a place to the enclosed reply of Mr. Sullivan, who, in addition to a profound knowledge of chemistry, is well acquainted with the manufacture of sugar on the continent, where he resided several years. Mr. Sullivan's information is not therefore of a speculative character. *John Sproule, Superintendent of the Beet Sugar Company in Ireland. Dublin, 87, Marlborough-street, August* 23.

The following paper is an abridgment of the one referred to above by Mr. Sproule.

A short time since an abstract of a paper, entitled, "On the Prospects of the Beet Sugar Manufacture in Ireland," by Professor Hancock, appeared in your Paper, in which he comes to the conclusion, that it is impossible to manufacture sugar in this country with any chance of success. Now, as I came to precisely the opposite conclusion in the pamphlet upon the same subject which I published some months ago, and which Dr. Hancock has done me the honour of drawing nearly all his calculations from, there evidently must be error somewhere. I examined the subject from five principal points of view—1st, the unsuitability of Ireland to be a great corn-growing country ; 2ndly, its adaptation to be a root-growing one ; 3dly, that it is profitable to grow Beet for the manufacture of sugar ; 4 hly, that the per centage of sugar contained in Irish-grown roots was at least equal to that contained in those pro duced on the continent of Europe ; and 5 hly, that the manufacture of sugar from Beet would be profitable in Ireland, even when exposed to the competition of all the tropical sugar-growing countries. I shall now proceed to examine how far Dr. Hancock has observed both rules in his criticism of the five points which I have put forward. Now, how does he meet the four first propositions already stated ? Does he show that the climate of Ireland is unfavourable to the growth of Beet ? Does he show that it is less profitable to grow it at the price which I have assumed than the usual crops ? Does he show by experiment that Irish-grown Beet contains less sugar than French ? No ; and will it be believed, his arguments are reducible to a few phrases, which may be represented thus ? No investigation had been made to show whether the circumstances of production resembled the north-east or the north-west of France, and the sugar Beet had been so little grown in Ireland, there were no statistics of prices to refer to. This mode of arguing a question possesses the rare merit of originality, and shows that the writer, if he has not studied the question upon which he has written, has at least studied the human nature of those with whom he wished to have the character of an oracle. As he has left these four points out of the five advanced by me untouched, I shall imitate him by dismissing the subject with one or two phrases. Dr. Hancock asks, "What was the price of Beet-root likely to be for a series of years in Ireland ?" And as nobody answered him, why has he not favoured us with his notions upon the subject ? I need scarcely tell my readers that it will mainly depend upon the price of corn, and upon the competition between the farmers in the neighbourhood of a sugar works. I have shown that to grow Beet is more profitable than to grow Wheat, a fact which is well known on the continent. Thus, in France, which may be considered a good corn country, the farmers estimate Beet at 13 f. per 1000 kilogrammes on a par with Wheat at 14 f. per hectolitre, and as the farmers receive in many parts of the north of France 18 f. per 1000 kilogrammes for their Beet, and only 13 f. per hectolitre for their Wheat, they very rationally consider the Beet the better of the two crops. Now, it does not require to be a political economist to find out that farmers will in every country seek their own interest, and cultivate that crop which pays them best, and that an active competition will spring up between them for a share of the larger profit to be derived from growing Beet, which must keep the price down. Now I come to the doctor's grand point of attack—Is it profitable to make sugar from Beet in Ireland ? I do not know really whether I ought seriously to endeavour to answer this part of the doctor's paper, as it is, in fact, a distorted picture of the whole subject. At page 41 of my pamphlet I give a statement of the probable cost of manufacture of Beet-root sugar, in which I endeavour to make out the most unfavourable case possible for the manufacturer. Thus, I take the price of Beet at the average of France, or very nearly ; I charge 9*l.* as the expense of manufacturing one ton of sugar ; I take the produce at only 5 per cent., the fixed capital at double what I am in a position to prove is now required, the price of the sugar at the lowest sum which it is likely to reach for many years, and the price of the residual pulp at one-third the price stated by one of the first authorities in France (Dumas) ; and, finally, I assume that the manufacturer gets no return for an entire year for that portion of his capital embarked in cost of raw material and expense of manufacture, and yet I have shown a profit. Now, why is it that Dr. Hancock did not take this estimate ? Could he tax it with exaggeration ? I shall tell him why he did not take it. Because it did not suit him as well as the one which he has in part taken, for he very cunningly avoided taking the whole. At page 43 I gave an estimate by M. Paul Hamoir, of Valenciennes, in which the produce is calculated at five different rates—thus, at 4½, 5, 5½, 6, and 6½ per cent., the object intended being to show among other things the influence of an increase in produce of ½ per cent. on the manufacturer's profit. Now, it is very singular that Professor Hancock took the lowest calculation—that is, 4½, the produce obtained 20 years ago. It is no wonder, therefore, that under free trade, where the price will fall to 28*s.* or 30*s.* per cwt., such a yield would not pay. I shall tell the doctor a fact, namely, that in the time of Napoleon the Beet sugar could not compete with foreign sugar, although it paid no duty, and sugar was 6 f. the lb. Had he lived in those days, he would have laughed at the man who would venture to assert that it would one day or other drive it from the market. Is Professor Hancock aware of the fact that 6 to 6½ per cent. of refined sugar can be obtained at present from the Beet, not by any new untried processes, but by processes in full operation in many continental establishments—thus, for instance, in the establishments of Messrs. Serret, Hamoir, Duquesne, and Co., who supplied the comparative estimates relied upon by the professor, 7 per cent. of raw sugar, equivalent to at least 5½ per cent. of refined sugar, is obtained. In the Beet-root sugar manufactory of Gotha, according to the statement of the director, Herr Matthai, the produce for the years 1840—1848 was 6.3, 6 8, 7.4 per cent. In the Baden establishment at Waghausel, one of the best conducted in Europe, according to official statements, the mean produce has been 8 per cent. of raw sugar. Now let us give the doctor's calculation, substituting a produce of 6 per cent. instead of 4½, and we shall have as follows :—

| | | | |
|---|---|---|---|
| The price of 61,607 tons of Beet, at 15*s.* 6*d.* per ton | £46,080 | 0 | 0 |
| Cost of manufacture ... ... ... ... ... | 39,900 | 0 | 0 |
| Making a total outlay of ... ... | £85,980 | 0 | 0 |
| The produce would, at 28*s.* per cwt., short price, sell for ... ... ... ... ... ... | 108,488 | 0 | 0 |
| Giving a balance in favour of the manufacturer of... ... ... ... | £22,508 | 0 | 0 |

But there is really no necessity of arguing the question in this way, and Dr. Hancock knows it too well. The simplest way to show the mode in which he has distorted the question, and the total absence of any numerical facts of his own, is to state that 15 tons of roots yield 1 ton of sugar, and that upon that supposition the following estimate would represent the profit:

| | | | |
|---|---|---|---|
| To 15 tons of roots, at 15*s.* per ton ... ... ... | £11 | 5 | 0 |
| Cost of manufacture, say at 9*l.* per ton ... ... ... | 9 | 0 | 0 |
| Total cost ... ... ... ... ... | £20 | 5 | 0 |
| The produce would be 1 ton of sugar, at 28*s.* per cwt. | 28 | 0 | 0 |
| Deduct expenses ... ... ... ... ... ... | 20 | 5 | 0 |
| Giving a balance of profit of ... ... | £7 | 15 | 0 |

In this estimate I have not included the pulp or molasses, and have assumed the cost of production per ton at the very highest sum paid in any manufactory in Europe, and yet there remains the very handsome profit of 7*l.* 15*s.* per ton ! I shall now leave the public to judge how far Dr. Hancock has succeeded in proving the impracticability of establishing a great branch of industry in this country.

It may not be unimportant to notice here a few facts relative to the present condition of the sugar manufacture in tropical countries. According to the enemies of native industry, one would imagine that the manufacture of cane sugar was in the most primitive condition, and that as soon as the processes were improved by which it was extracted the price of sugar would fall to such an extent that no indigenous sugar could be profitably produced, unless under the most extraordinary protection. There can be no greater mistake. Although it is true that the cane sugar producers have done very little to improve their processes, yet, by borrowing from the Beet-root sugar manufacturers, the manufacture of cane sugar has arrived at nearly as great a state of perfection as that of Beet sugar. Eighty-two per cent. of the juice of the cane can now be obtained, and it is by no means probable, from the nature of the canes, that it will ever pass that per centage with economy. Most of the sugar-growing countries are now provided with the most approved apparatus. The one firm of Derosne, Le Cail, and Co., of Paris, have put up, since 1837, apparatus in Bourbon, Guadaloupe, Martinique, Cuba, Surinam, Demerara, and Java, capable of manufacturing 480,500 cwt. of sugar. And, since 1831, the great firm of Pontifex and Co., of London, and many other English houses, have been occupied in setting up similar apparatus in the British colonies. It is, threfore, a great mistake to imagine that the price of sugar can fall in future years to such an extent as to render it impossible to manufacture sugar in Europe, especially when it is recollected that the Beet sugar, from which has originated all the improvements in the manufacture of cane sugar, is itself very far from having reached its limit of perfection. At a moment like this, when it is the duty of every Irishman to assist, as far as he is able, all legitimate attempts to encourage the establishment of manufactures in this unfortunate country, is it not lamentable to find men using the position and the influence which they possess to damage a great enterprise ? There is a wide difference between the man who points out errors, into which the most careful may fall, and who endeavours to supply new facts, in order to prevent the money of the country from being squandered, and those who, to gain a cheap reputation, take the most inopportune moment to throw discredit upon the statements of others by a system of special pleading, and with the air of a prophet. *William K. Sullivan.*

## Home Correspondence.

*The Exhibition.*—Harvest over, now is the leisure time of farmers. If anyone is disposed to lend a hand to the more deserving young men of his village, who are no doubt desirous of seeing the Exhibition, perhaps my experience may be of use to him. I went up with five others, paid for their return tickets, and found them lodgings. We lodged at the chambers of the Metropolitan Association, in Albert-street, Mile-end. We were away from Monday morning till Saturday night ; the whole cost to me, including all my own expenses and those I have mentioned of the others, together with occasionally the cost of the whole party in seeing shilling sights, was 6*l.* 10*s.* The return excursion tickets cost 9*s.* 8*d.* each ; and we were comfortably lodged. Contrast this with my experience of the next week, when my expense from Tuesday morning till Friday night, to the Cattle Show at Windsor and thence to the Crystal Palace again, were exactly 6*l.* 10*s.* for myself alone, owing to the higher charges of first-class hotels and ordinary trains. Let any one then deny himself the luxury of 3*s.* beds and 5*s.* dinners, and he will be the gainer of enough to frank a number of his men to London. *M. S.*

*The Harvest in South Hants.*—Wheat : an average crop, but much "tailing," caused by the gales of the 26th and 27th of July, which knocked the Wheat about at a very critical period of its growth. Barley : not such a promise as last year ; three weeks' heavy rains retarded sowing, and when in the milk, dry weather set in, rain followed, and it recovered, but the crop will be short. On "shaly" lands it looks red and dried up, rather than ripened. Oats : the crops of this cereal very fine in most places. The heavy dews at night during the earlier stages of its growth improved them much ; whereas Barley did not derive the same corresponding benefit—the reason is obvious to a farmer. Beans and Peas : the former "bloomed" well, but West and South-West gales stripped the haulm and blighted the crop ; in other places the plant was green and vigorous, but the yield is not great, either of the winter or spring varieties. Peas were, and are, a very fair crop, the earlier sown particularly, but the pods contain a maggot. Mangold Wurzel : in some places the fly or "flea" injured the young plant ; but three weeks' drought in July gave this crop the hardest blow. The April sown look best, and some sown late in May, upon sandy loams, are getting on, contrary to expectation. But the crop for the most part is a failure. Swedes : the early sown look the best ; and where they had the advantage of storms look very fine—but in many places the Swedes after "brairding" were carried off by the fly, which has been more busy this year than ever was known. The late sown are a regular plant, and if properly hoed and attended to after harvest may, in these warm and southern climes, prove a fair crop. Potatoes : early sown good and free from disease—late sorts unquestionably stricken. *X. Y. Z., Hants.*

*Wheat Dibbling.*—In the first week of September last I dibbled a plot of ground with Wheat, at the rate of about 2 pecks per acre, on a strong soil in good heart, after Potatoes ; the distance between the rows was from 10 to 12 inches. On account of the ground being very dry and rough it came up irregular, but so soon as rain came it changed its appearance, and before winter it tillered out into large tufts, running horizontally on the ground, or spreading out on all sides. Through the winter and spring it looked healthy and vigorous, and was admired by all who saw it ; but I did not altogether like its appearance, on account of its being too thick, and before it came into ear it became too luxuriant and flaggy ; and when the late heavy rains came it fell, but on account of the stiffness of the straw it is not fallen so close to the ground as to take damage ; it has heavy long ears, and looks equal to 6 quarters to the acre. In the second week of October last I dibbled a piece of ground adjoining the other with Kessingland Wheat, at the rate of 2 pecks per acre, and 12 inches between the rows ; it came up very well indeed, but many of the plants were eaten off by the slugs, &c., and it looked so miserable during the winter, that it had more the appearance of a fallow field than a piece of young Wheat. In the spring, so soon as the ground became dry enough, I stirred the soil between the rows ; it immediately began to improve, and after being well hoed three or four times, it soon covered the ground, and was the surprise of all who saw it. I never saw a finer crop than it now is. The ears are very heavy, and most of them measure from 5½ to 6½ inches long. It has the appearance of yielding at the rate of 6½ qrs. to the acre. The Kessingland is more prolific and stouter of the straw than the sort with which I dibbled the other piece. There is also another incident which I wish particularly to mention respecting the two crops, *i. e.*, the crop dibbled the first week in September was dibbled dry ; the crop dibbled the second week in October was vitrioled. The September sown is free from blight and smut ; the October sown has in it about 3 per cent. smut ears ; the two pieces are side by side, and how to account for the one piece being smutty and the other not, I do not know, except it be the difference in the time of sowing. There are several crops of Wheat in this parish dibbled with your machines, all of which I have inspected ; they are all good except one, which was dibbled at the rate of 2 bushels per acre. The others are stiff of the straw, less lodged, better headed, and are altogether decidedly better than the drilled and broadcast sown. I grew Barley in the year 1849 at the rate of 80 bushels per acre ; I believe my crop this year is nearly as good. My winter Beans were dibbled in October ; they are very good. I have proved your cultivator to be a very superior implement to be used amongst all crops sown in rows. I have this year frequently used it in stirring the soil between my Potatoes, Swedes, &c., to the depth of 7 or 8 inches. I find that from frequently stirring the ground, it greatly improves the crop. *William Griffin, Eydon, Daventry : To Dr. S. Newington, 36, Wellington-square, Hastings.*

*Rape.*—It was my practice to grow yearly a few acres of Rape for sheep feed, on land intended for Wheat ; it answers two purposes—first, feed for sheep, and secondly, the Wheat crop is much the better for it ; but it requires caution on the part of the shepherd, or the sheep will be blown. I have generally had it mown in the morning (and sometimes sprinkled with salt), what was intended for the sheep to feed on in the evening, but I think with every attention there is some danger in feeding off Rape—if the crop is good, more particularly. I have been led to make these remarks on reading "J. D.'s" communication on the culture of Rape,

which is very good ; but I think persons who have never fed off Rape need a caution. *George Dyer, Islington.*

*My own Farm.*—Extent : 465 acres. Soil : stiff red clay marl, under-drained and manured :

| Crops. | Acres. | Estimated Produce. |
|---|---|---|
| Wheat | 104 | 52 acres, 40 to 50 bushels per acre. 52 acres, 25 to 36 bushels do. |
| Oats | 77 | 60 bushels per acre. |
| Beans | 34 | 24 to 36 bushels per acre. |
| White Peas | 26 | 20 to 36 bushels per acre. |
| Red Clover | 7 | 44 acres very good. |
| Other seeds | 37 | |
| Fallow, Rye, Vetches, and the roots after them | 58 | Looking well. |

All except the price quite satisfactory. I trouble you with this note and sample of the 52 acres of this sort of winter-sown Wheat on the land longest in hand, on which Wheat is grown every other year. *F. E. Williams.*

*The Labourer.*—In your Paper of the 9th inst., I noticed an article on the Improvement of the Condition of the Agricultural Labourer. This subject has long since been forced upon my mind, by witnessing the state of the peasant in France and the Duchy of Baden, Switzerland, &c. In those countries a certain quantity of land is attached to each cottage, sufficient to afford sustenance for the family, there being very little demand for labour. The effect of most families having a property at stake, is to render them above committing petty thefts, as they do in this country. Fruit remains by the road-side untouched, and grain threshed out is left for weeks in the open field without any fear of pillage. The rapid improvements and inventions for lessening the employment of labourers, which are daily progressing, must, at no very distant time, force the system above alluded to upon us ; and it is much to be desired that noblemen and gentlemen of large estates should commence a plan of rewarding their cottager tenants, according to their degrees of merit, for faithful services as farm labourers. The plan I suggest would be to have three different classes of cottages, with land attached to each ; the first class should have 3 acres, the second class 2 acres, and the third class 1 acre, to be divided and cultivated on the Swiss plan. These cottages should be let at a farm rent, to those labourers on each farm who may be recommended by the occupier thereof. I entirely agree with you on the second part of this article, viz., that the first and grand step towards raising the condition and value of the farming servant, is the plan Mr. Batson has adopted ; and the necessity for bringing up the rising generation of labourers on a system commensurate with the advance of steam power, as applied to farming purposes, and the expensive implements they will have to manage, must be evident to every one who gives the subject a thought. If, on selfish principles, these plans recommend themselves, how much more ought they not to do in a moral point of view ? The farm labourer remains now the same ignorant, brutal, thieving, Sabbath breaking ruffian he was 40 years ago [This is a desperate character. Of what district or county is it true ?] but there are obvious reasons why he should not be continued in this state. *J. P.*

*Farming on the Continent.*—Will you, Mr. Editor, or any of your correspondents, be kind enough to give me your or their advice under the following circumstances ? I have two farms—one is heavy land, the other loamy—worth from 20*s.* to 30*s.* rent, if they were 50 miles from London. Oats here are 1*s.* 3*d.* per bushel, Barley 1*s.* 9*d.*, and Wheat 4*s.* My difficulty is the same as most farmers in England, how to grow Wheat at the least expense, only greatly aggravated — other corn being here worth so little. You will say, grow Wheat every other year, and buy Barley and Oats to feed with. Good ; but then meat is only 2½*d.* per lb., and the breed is so bad, that they will not lay on flesh, to repay, at these prices. Cows pay better, milk being 4*d.* per gallon ; but even they give very little milk. Labour is cheap, particularly horse ; so that I reckon a naked fallow, with three ploughings, will only cost, rent and all, 1*l.* ; I therefore fancy that tillage is the cheapest means of fertility. I forgot to mention that I have nearly the same number of acres in rough pasture that I have in arable—for nothing ; so what system or what rotation can I follow to grow most Wheat ? The latitude is 57° ; the summer hotter, and the winter colder and longer than in England ; but the Wheat bears it well. I can grow roots, but they are too late to fallow with Wheat. Will winter Beans or Tares do here ? Without Turnips, I can only manure once in six years. What think you of fallow, Wheat, Tares (manured), Wheat, Beans or Clover, Wheat ?—I send you my address, in case any gentleman may wish to favour me with a line, instead of through your columns. *G.*

## Societies.

### ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Monthly Council was held on Wednesday last, the 6th of August : present—Mr. Raymond Barker, V.P., in the chair ; Lord Camoys, Sir Robert Price, Bart., M.P., Colonel Austen, Mr. Barnett, Mr. Bramston, M.P., Mr. Brandreth, Mr. Burke, Mr. W. G. Cavendish, M.P., Mr. Hamond, Mr. Fisher Hobbs, Mr. Kinder, Mr. Milward, Professor Sewell, Mr. Shaw (London), Professor Simonds, Mr. Simpson, and Mr. Smith (Exmoor).

Thomas James Agar Robartes, Esq., M.P., of Lanhydrock House, Bodmin, Cornwall, and Porchester-terrace, Hyde Park, was elected a Governor of the Society.

The following new members were elected :—

Hamilton, Capt. Arch. Rowan, Killyleagh Castle, Co. Down.
Culliford, William, South Hayling, Havant, Hampshire.
Williams, Michael, Trevince, Truro, Cornwall.
Coombs, Thomas, jun., Dorchester, Dorsetshire.
Moysey, Henry G., Batheaston Court, Wiveliscombe, Somers.
Willacy, Richard, Penwortham Priory, Preston, Lancashire.
Leonard, Mark S, India-buildings, Fenwick-st, Liverpool.
Call, William Berkeley, Whitfield House, Callington, Corn.
Groves, Captain J. R., Governor of the Milbank Prison.
Harrison, John Thornhill, Frocester Court, Gloucester.
Akers, Richard, Bourton-on-the-Hill, Moreton, Gloucester.
Bell, William Edward, Gorleston, Suffolk.
Devincenzi, Giuseppe, 50, Upper Berkeley-street, Portman-sq.
Chanter, T. B., Bideford, Devonshire
Tweedy, William Mansel, Truro, Cornwall.
Tilsley, Edwin, Moreton-in-Marsh, Gloucestershire.
Champion, William, Calcot, Reading, Berks.
Smith, Abel, jun., Woodhall Park, Ware, Herts.
Durham, Makin, Thorn, Yorkshire.
East, Sir Gilbert Bart., Hall-place, Maidenhead, Berks.
Pardoe, Henry, the Yew Tree, Ombersley, Worcestershire.
Hargraves, George, Penbedw Hall, Mold, Flintshire.
Moore, George, 68, Oxford-terrace, Hyde Park.
Foster, John P., Bolton House, Seven-Sisters'-road, Holloway.
Bortier, J. P., Lapanne, Furnes, Belgium.
Vaux of Harroden, Lord, Highams, near Bagshot.
Wilson, Joseph Henry, Gillets, Henley-on-Thames.
Coote, Eyre (11th Hussars), West Park, Fordingbridge, Hants.

Finances.—Mr. Raymond Barker, as Chairman of the Finance Committee, then laid before the Council the Report on the accounts of the Society to the end of the previous month ; from which it appeared that the current cash balance in the hands of the bankers in London and in Windsor, to meet the payments on account of the Windsor meeting, amounted to 4664*l.* The Council confirmed this report, and adopted the recommendation of the committee that the sum of 1010*l.* should be invested in the public funds, in the name of the Trustees of the Society. The Chairman then laid before the Council the usual quarterly statements, showing the financial state of the Society under different heads of income and expenditure, and of assets and liabilities.

Fat Cattle.—The Duke of Richmond transmitted to the Council an official letter addressed to him on the 16th of July last, by the Earl of Hardwicke, one of the Vice-Presidents of the Society, and an exhibitor of Short-horns of the Wimpole variety of breed at the Windsor Meeting, of which the following is the substance :

"I regret that I am not able from domestic circumstances to be present at the Show at Windsor. I am informed by competent persons that the class which six in-calf heifers of mine are shown in, namely No. 4, the animals that have won prizes are fat animals. I am informed that they have been regularly put up and fatted on various kinds of food, and are now shown as competing stock. I have always understood, and have myself conformed to the rule, that this show was expressly for lean and breeding stock. Had I been aware that it was allowed to show fat stock with a prospect of success, I should certainly have abstained from sending six heifers to the Show. I write this letter now, in order that the attention of your Grace and the Council may be called on the spot to this statement, for the purpose of verifying or disproving what I now state ; as, if true, it will form a fit subject for further proceedings."

One of the earliest objects of the Royal Agricultural Society of England having been to encourage improvements in the quality of the breed of live-stock for agricultural purposes, the Council have constantly had under their consideration the best means of promoting this desirable object, in contradistinction to the express object of the Smithfield Club, which is stated to be—"the supply of the cattle markets of Smithfield and other places with the cheapest and best meat ;" the animals exhibited at the Christmas shows of the Club not being required to be either of pure breed or qualified by circumstance for the reproduction of their species, or to be restricted in their mode of feeding. The following instructions have accordingly been constantly included prominently among those given to the judges of stock of the Royal Agricultural Society at its country meetings :

"The Council desire the attention of the judges to be most particularly called to the following instructions for their guidance, namely,

"1. As the object of the Society in giving the prizes for neat cattle, sheep, and pigs, is to promote improvement in breeding stock, the judges, in making their award, will be instructed not to take into their consideration the present value to the butcher of animals exhibited, but to decide according to their relative merits for the purpose of breeding.

"2. In the classes for stallions, mares, and fillies, the judges, in awarding the prizes, will be instructed, in addition to symmetry, to take activity and strength into their consideration."

As complaints have, however, been continued to be made to the Council, that some of the animals to which the Society's prizes have been from time to time awarded have been rather "dressed up" as fat stock in the results of high feeding, than exhibited in those natural developments of breed and sound condition which ought to distinguish animals intended to promote improvements in the breeding-stock of the country, the Council have this year still further pressed upon the judges the responsibility of this distinction in their awards of the Society's prizes. In their report to the last general meeting they referred still more strongly to the subject in the following passage :—

"The Council have taken measures for obtaining a greater number of nominations from which to select the Judges for the Country Meetings ; but they still feel the imperfection of all plans hitherto adopted for their appointment. The Council duly appreciate the great importance of a strict and impartial adjudication of the Society's prizes by men not only disinterested in themselves, but fully qualified by their abilities and experience for the arduous task confided to them ; and the Council will esteem it a favour if the members of the Society at large will from time to time transmit to them any suggestions that may tend to promote this desirable object, and essentially to give effect to that competition for excellence which the Society, by its premiums, evinces so great a wish to excite. They have already referred it to the Judges, as part of their duty, to ascertain and report to the Council any failure in the due shearing of the sheep, or any excess in the market condition of the animals inconsistent with their character as breeding stock. They consider that the higher the character of their Judges becomes, the more powerfully will they be able to aid the Council in repressing many of the abuses alleged to take place in the competition for prizes. They also hope that the time is not far distant when the judgments given in the Show Yard in the case of Live Stock will be founded on well-defined and acknowledged principles, having reference, in each class, to some assigned standard of excellence ; and that these judgments, although formed on less distinct and constant data than in the case of implements, may gradually approximate in some degree to uniform and consistent results, that may prove, like those in the Implement Yard, satisfactory at the same time both to the Judges and competing exhibitors ; and thus tend to establish those points of form, development, and quality which constitute perfection of breed in the different classes of animals adapted for agricultural purposes."

In order, too, that no false estimate might be made by the Judges in distinguishing between those developments of condition which result naturally from the healthy genial tone and finely-bred qualities of an animal, and that mere fatness which is occasioned by special feeding, the Council included in each of the letters of appointment to the Judges for the Windsor Meeting the following notification :—

"In order to aid the Judges in carrying out the wishes of the Council, in reference to the healthy condition of the animals as breeding stock, and to their soundness and freedom from infectious or contagious disease, the Council have appointed Professor Simonds, the Veterinary Inspector of the Society, to act as Referee to the Judges at the Windsor Meeting."

The Council have already received from Professor Simonds some interesting information connected with his general inspection of the animals in the Show-yard, and his particular examination given of those points to which his attention was specially drawn by such of the Judges as availed themselves of his professional opinion ; which they have reserved for consideration at a future meeting.

Mr. Fisher Hobbs gave notice of his intention to move the following resolution at the Special Council in December, when the prizes for Live Stock at the next Country Meeting shall, agreeably with the bye-laws, be taken into consideration :—

"That in future, before the Judges sign their awards, Professor Simonds shall be directed to make an accurate inspection and investigation of the animals to which the Judges intend to give the Prizes of the Society."

Imperfect Animals.—Mr. Matthew Smith, of Longbrow, near Hexham, having addressed a letter to Prof. Simonds, as the Veterinary-Inspector of the Society, inquiring whether he had certified that one of the bulls to which a prize had been awarded at the Windsor Meeting, and which had an imperfection as a breeding animal, could be considered a safe stock-getter : this letter was laid before the Council. Prof. Simonds stated that he had inspected the bull referred to, and remarked the circumstance to which Mr. Smith made allusion, but not having been called in as referee by the Judges of that division, he had not been required to give any professional opinion. At the same time, he might remark that nature had with wise foresight endowed animals with duplicates of some of the most important organs of the body, as, for instance, in the case of the eye and the ear. On the particular point to which Mr. Smith referred, he considered, that although the circumstance in every such case ought to be well examined, the particular bull to which the prize had been awarded at Windsor was not essentially deficient for the purposes required.

Cart-Stallions.—Mr. F. Leyborne Popham, of Littlecote, near Hungerford, Berkshire, having received by mistake from the office of the Society a form of Certificate for "Agricultural Stallions of any age," instead of the one he required for "Agricultural Stallions of two-years-old," he had not perceived the mistake when filling up that certificate for a two-years-old pure cart stallion he intended to exhibit at the Windsor Meeting ; nor was the circumstance noticed under the subsequent stages of the arrangements in the show-yard, until the Judges had completed their awards and "highly commended" Mr. Popham's colt, in competition with horses of "any age." Mr. Popham therefore suggested to the Council that the heading of the form of certificate should be altered in the case of stallions of any age by the addition of the words, "over two years old."—On the motion of Sir Robert Price, the Council directed that the question of limiting the class of stallions of any age, as proposed by Mr. Popham, should be referred to the Special Council in December, when the prize-list of next year would come under consideration ; but that the following annotation should in the meantime be placed under the announcement of commendations at the Windsor Meeting, to be published, as usual, in the next part of the Journal, namely, "In consequence of a mistake in respect to the certificate, this horse was placed in class 1 instead of in class 2 ; and thus was precluded from competing with the horses of his own age."

Prize Essays.—Mr. Pusey, M.P., chairman of the Journal Committee, having addressed to the council suggestions on the subject of prizes to be offered for next year's essays, the council took the subject into their consideration, and agreed to the following schedule of prizes, the essays competing for which are to be sent to the secretary on or before March 1, 1852 and 1854 respectively :—

PRIZES FOR ESSAYS : 1852.

Country Meeting Committee.—On the motion of Mr. Brandreth, the following General Lewes Committee was appointed:—The Duke of Richmond, chairman; Mr. Villiers Shelley, vice-chairman; Colonel Austen, Mr. Raymond Barker, Mr. Brandreth, Colonel Challoner, Earl of Chichester, Mr. Darby (of Marklye), Sir Edward C. Dering, Bart., Mr. Ellman (of Glynde), Mr. Brandreth Gibbs, Mr. Grantham, Mr. Hamond, Mr. Fisher Hobbs, Mr. Law Hodges, M.P., Sir John V. B. Johnstone, Bart., M.P., Mr. Jonas, Mr. Milward, Mr. Pusey, M.P., Sir Matthew White Ridley, Bart., Mr. Shaw (of London), and Sir Henry Shiffner, Bart.

Agricultural Implements and Machinery.—Colonel Challoner, Chairman of the Implement Committee, transmitted to the Council the following Report of the committee:—

"The Implement Committee, having had referred to them by the Council the question of offering prizes at the Lewes Meeting for fixed steam-engines and threshing-machines, with an instruction that the Committee would at the same time make to the Council any suggestions or recommendations connected with the prizes generally for that meeting, before the final arrangement of the prize-sheet at the Monthly Council, in August next, beg to make the following report accordingly:

I. They submit to the Council an arrangement of the Prize-sheet, in which the prizes already proposed by the Council are included, along with those which the committee recommend for adoption, namely, prizes for portable and fixed steam-engines and threshing-machines, dynamometer for ploughs, and instruments for hand use in draining; and in which the conditions of competition and general regulations for exhibition and trial are stated.

II. They recommend that the following articles be ordered:
1. A second brake, at a charge not exceeding 50*l.*
2. Two single-horse trucks for two tons; and six hand-trucks, of three different sizes, for less weights.
3. Three leather belts of proper length, with buckles, and punched with several holes, at small distances apart.
4. Six hand-spikes, or levers, of different sizes, shod with iron.

III. At the request of the Committee, Mr. Amos, the consulting engineer, has expressed his willingness to take charge of the arrangements for the trial of horse-gear.

IV. The Committee have considered the question of ascertaining the weight of the steam-engines competing for prizes; and they have decided that the judges, in forming their decisions, will not require a knowledge of the actual weight of such engines, in addition to the aid which their judgment always receives from the estimation of the eye, and the calculation of mechanical power in relation to the wear and tear of material. (Signed) C. B. Challoner, Chairman

This report was unanimously adopted by the Council, and the following schedule of prizes agreed to:

IMPLEMENT PRIZES: 1852.

| | | | |
|---|---|---|---|
| Plough for general purposes | £7 | Subsoil pulveriser ... ... | 5 |
| Plough for deep ploughing | 7 | Corn dressing machine ... | 10 |
| One-way, or turnwrest plough ... ... ... | 7 | Grinding mill for breaking agricultural produce into fine meal ... ... ... | 10 |
| Paring plough ... ... | 5 | Linseed and corn crusher... | 5 |
| Drill for general purposes | 10 | Chaff cutter, to be worked by horse or steam power | 10 |
| Steerage corn and Turnip drill ... ... ... ... | 10 | Chaff cutter, to be worked by hand power ... ... | 5 |
| Drill for small occupations | 5 | Turnip cutter ... ... | 5 |
| Cheap small-occupation seed and manure drill, for flat or ridged work ... ... | 5 | Oilcake breaker, for every variety of cake ... ... | 5 |
| Turnip drill, on the flat ... | 10 | One-horse cart, for general purposes ... ... ... | 10 |
| Turnip drill on the ridge .. | 10 | Light waggon, for general purposes ... ... ... | 10 |
| Drop drill, for depositing seed and manure ... | 10 | Draining tile or pipe machine ... ... ... | 20 |
| Manure distributor (broadcast, moist or dry) ... | 5 | Instruments for hand use in draining ... ... | 3 |
| Portable steam-engine, not exceeding 6 horse power, applicable to threshing or other agricultural purposes ... ... ... | 40 | Heavy harrow ... ... | 5 |
| Second best do. ... ... | 20 | Light harrow ... ... | 5 |
| Fixed steam-engine, not exceeding 8 horse power, applicable to threshing or other agricultural purposes ... ... ... | 20 | Cultivator, grubber, and scarifier ... ... ... | 10 |
| Second best ... ... ... | 10 | Pair-horse scarifier ... | 5 |
| Portable threshing machine, not exceeding 2 horse power, for small occupations ... ... ... | 10 | Horse-hoe, on the flat ... | 10 |
| Portable threshing machine, not exceeding 6 horse power, for larger occupations ... ... ... | 20 | Horse-hoe, on the ridge ... | 5 |
| Portable threshing machine, not exceeding 6 horse power, with shaker and riddle; to be driven by steam ... ... ... | 20 | Horse-rake ... ... ... | 5 |
| Fixed threshing machine, not exceeding 6 horse power, with straw-shaker, riddle, and winnower, that will best prepare the corn for the finishing dressing machine; to be driven by steam ... ... | 20 | Horse seed dibbler or depositor (not being a drill) ... | 10 |
| | | Gorse bruiser ... ... | 5 |
| | | Cheap steaming apparatus, for general purposes ... | 5 |
| | | Dynamometer especially applicable to the traction of ploughs ... ... | 5 |
| | | Silver medals for miscellaneous awards and essential improvements ... | 20 |
| | | Any new implement (such sum as the Council may think proper to award). | |
| | | Mr. Slaney's prize for plough to fill in the soil cast out of drains, with not more than four horses, two and two abreast ... ... | 10 |
| | | | £449 |

Sainfoin Machine.—Mr. Hamond, as one of the Stewards of the Implement-yard for the Lewes Meeting, hoped that by all means some of the implement makers who were preparing machinery for that occasion would not fail to take advantage of the great interest and importance connected at the present time with the cultivation of Sainfoin, by inventing a machine for "kusking" the seeds of that crop; which was in many parts of the country rapidly superseding that of Rye-grass; he therefore hoped to find in the miscellaneous department at Lewes some such machine as that to which he alluded, and which was much required.

Miscellaneous Communications.—Letters from Mr. Mechi and Mr. Astbury on arrangements connected with the Society's Show-yard. Mr. Curtis's offer on his return from the Mediterranean, to inspect any specimens of insects infesting agricultural crops. Mr. Michelmore's statement of occurrence of pleuro-pneumonia; and Prof. Simonds's reply. Fieldbook showing the crops for many years on the estate of Captain T. Martin, R.N. Eight coloured Drawings showing the improvements in progress on the Blakesware Farm of M. H. Gosselin, Esq., and plans of the farm buildings, by Captain W. S. Moorsom, C. E.—Samples of Guernsey Butter, of very fine, rich quality, from Major Le Beir, Sec. of the Agricultural Society in that island.—Further statement from Mr. Bryant, on his system of cultivation.—Further papers on Flax Cultivation, from Mr. Hill Dickson.—On manufacture of Flaxen Ropes, from Mr. Donlan.—Communications on the theory of atmospheric and other natural phenomena, from W. Stevenson, late Lieut. of Revenue Police.

The Council having ordered their thanks for these communications and the numerous presents made to the Society, adjourned over the autumn recess to the first Wednesday in November.

## Review.

*Journal of the Manchester and Liverpool Agricultural Society.* Haddock and Son, Warrington.

It is a pamphlet of 50 pages, containing the rules and prize list of the Society, and the report of the committee of 1850—from which we learn with pleasure that the now united societies of Manchester and Liverpool are in prosperous circumstances—and lastly, the award of premiums at the last annual meeting: and it is to this part of the work we would direct the attention of our readers. The Manchester and Liverpool Agricultural Society is distinguished amongst provincial societies by the number of premiums offered by it for the best cultivated farms, and the following extracts are interesting, as showing that energy, enterprise, and intelligence are not confined to the manufacturing or commercial classes in the neighbourhood of the two great towns of Lancashire.

"(Four claimants.) To Mr. Robert Birch, Netherton, near Liverpool (tenant to the Earl of Sefton), principally dependant upon farming, for the best cultivated farm of not less than 150 acres, 12*l.* *Inspectors' Report.*—This farm is 250 acres, of light black soil on sandy subsoil, and held on yearly tenure. The cultivation is as follows:—Pasture, 12 acres; Clover and seeds, mown, 54 acres; meadows (irrigated), 38 acres; ditto (not irrigated), 17 acres; Wheat, after Potatoes, 28 acres; ditto, after Turnips or other green crops, 22 acres; ditto, after other crops, 7 acres; Oats, after Wheat or other crops, 18 acres; Barley, 13 acres; Potatoes, 27 acres; Turnips, 5 acres; Mangold Wurzel, 5 acres; orchard and gardens, 1 acre; homestead and roads, 3 acres; total, 250 acres. *Rotation of Crops:*—1st, Potatoes or Turnips; 2d, Wheat; 3d, Barley or Oats, and seeded down, to remain three or four years in Grass. *Stock* on this farm:—Farm horses 10, coach ditto 2, bulls 1, dairy cows 12, heifers 16, rearing calves 8, pigs 12; total, 61. The cows are fed in summer with Grass or mown Clover, and in winter on Turnips, hay, Mangold Wurzel, with some oil-cake: the horses on green food in summer, with a little corn, and in winter on hay and steamed roots; to these a little corn is added. From 350 to 400 tons of manure is made in the farm-yard annually, which is applied to green crops. Liquids from the house and farm are all made available. The claimant buys 900 tons of cow and horse dung annually, which is mostly used for Potatoes; he also buys 300 tons of night-soil annually, which is used as a top dressing for Grass. The cow and horse manure cost him 4*s.* per ton, and the night-soil 2*s.* per ton, cartage not included. He has marled 30 acres with 2 'roods' (of 64 cubic yards per rood) of marl per acre, within the last — years. He has also made a new road through the middle of the farm, 918 yards long, which is substantial and durable: it is paved, and the landlord found stones for it. Claimant has eradicated 8560 yards of old fences, filled up the ditches, drained several pits, and by these improvements he has gained nearly 8 acres of land. He has planted 7966 yards of quick thorn fences, cut an open drain, or sewer, 816 yards in length, 9 feet wide at the top, 2 feet broad at the bottom, and 7 feet deep. He has laid 96,000 lineal yards of drains on his farm. The cost of these improvements, exclusive of materials found by the landlord, the claimant states to be 754*l.* *Crops.*—Some portions of the Wheat crop on the lighter land of this farm would not yield a heavy produce, but was healthy in appearance. On a portion of the heavier land the Wheat was as good as any we have seen this year. The Oat and Barley crops were good, and the Potatoes vigorous and clean. Turnips were clean and uniform, and the bulbs the largest we had seen up to the time of inspection. Mangold Wurzel were thin of plant, the seed having vegetated badly; such however as had vegetated had produced large bulbs. All the fences on this farm—most of which are new—are well kept, are very clean, and had evidently had great attention paid to them. The gates are such as we rarely see on any farm for size, strength, and neatness. Occupation roads good, and the farm yards, house, and garden, particularly neat.

"To Mr. Richard Dobell, Leftwich, near Northwich, Cheshire (tenant to the representatives of the late John Adamson, Esq., John Tollemache, Esq., and others), principally dependent upon farming, for the next best cultivated farm of not less than 100 acres. The Medal (an extra prize.) *Inspectors' Report.*—This claimant's farm is 102 acres. It is held on lease for a term of 14 years, seven of which are unexpired; but the claimant has lived upon it all his life (50 years perhaps.) The soil is a light loam, and mostly of good depth, lying on a subsoil of grey sand and 'foxbench.' The surface is undulated, with a western exposure, is in a good climate but far too much crowded by hedge-row timber trees. There is plenty of fall for drainage on this farm, and it is cropped as follows:—about 25 acres of old pasture, and 25 acres of pasture of from one to six years old, making 50 acres in pasture; 10 acres of old meadow, 16¼ of Clover and seeds, mown, and of from one to three years old; 3½ acres of Wheat after Turnips and other green crops; 2 acres of Barley after green crops; 3 acres Oats after Leys, 1 acre Rye, 1 acre Vetches, consumed whilst green by cattle and horses; 4 acres Potatoes; 3¼ acres Turnips; 2 acres Beet; ¼ acre Carrots; 2 acres Cabbages and other green crops; total green crop, 12¼ acres; 2½ of orchards and gardens, and 2½ of homesteads, occupation-roads, &c. The customary rotation is, 1st, Oats after Leys; 2d, green crops; 3d, Wheat or Barley sown with Clover and other seeds; 4th, Clover and other seeds mown twice; 5th, Grass mown once, then pastured several years. The stock consists of two farm horses, two colts, one bull, 26 dairy cows, 16 heifers, five rearing calves, 94 ewes, 70 lambs, and 10 pigs; total stock, 226 head. The horses are kept on green food in summer, and on hay, corn, and Carrots in winter. Cows depastured on Grass in summer, in winter fed on straw and Turnips when out of milk, and on hay, corn, and Beet, when in milk. Stirks and calves pastured in summer, and have straw and Turnips in winter. The sheep pastured in summer and winter, with the addition of Turnips and Beet in the latter season. The quantity of manure made on the farm every year is nearly 200 tons, which is chiefly applied to the green crops. The whole of the liquid manure is made available. During the first three years of the present term, claimant manured the whole of his farm with boiled bones, at the rate of one ton per acre, and at a cost of 4*l.* 10*s.* per ton, exclusive of labour. He has since purchased annually two tons of boiled bones, at 4*l.* per ton, which is applied to the Turnip crop; also four tons of raw bones, at 6*l.* per ton, applied annually to the Clover and seeds, and one ton of guano applied to Turnips and Beet. The whole of the farm has been drained within the last seven years, from 3 to 4 feet deep, at various distances, according to the nature of the subsoil. The whole done with tiles on slate soles, and at the claimant's own expense. He has marled 45 acres within the same period, with 100 cubic yards per acre; has also spent 200*l.* in repairing and improving the farm-house and outbuildings, and in a new stable, dairy, and kitchen. Has expended 15*l.* in filling up old pits. The landlords have been at no part of the expense of improving either the land or buildings. The claimant has also within the last three years made two liquid manure tanks entirely at his own expense; one of these, to receive the urine from the shippons and stable, is 14 feet long, 6 feet wide inside, and 9 feet deep, and will contain 756 cubic feet; it is built of brick and cemented; there is a recess at one end for retaining any sediment; the tank is arched over, and has a pump fixed at one end. To this tank there are covered tile drains from the entrances to the various buildings, where the liquid manure passes through grids into the drain. The other tank is a circular one, situate behind the house from which it receives the wash, as well as the urine from the petty and piggeries; it is 8 feet diameter, and 10 feet deep; is made of bricks, and cemented inside; it is not covered at the top, but fenced off. This tank will contain 502 cubic feet. The claimant purchases ammoniacal water from a neighbouring gas-works, which he carts to this tank, and mixes with the urine and wash in the proportion of about one-sixth of the former to five-sixths of the latter; and when well mixed together, is carted to the meadow-land, and answers very well. This farm is all perfectly drained, and the ditches and out-falls kept clean and open. Potatoes mostly got up and sold, when inspected (21st Aug.), and the land left in a clean state. The crop of Turnips and Beet were, generally, very good, clean, and healthy. One acre of Turnips, after a crop of Vetches cut green, were very badly diseased with 'fingers and toes,' and part of them were not very clean. The Cabbages were the best and heaviest crop we ever saw; and the land on which they grew had been well fallowed the autumn before, and a good dressing given it at the same time, of liquid manure and ammoniacal water. There was not a weakly plant in the whole lot (about one acre and a-half.) Wheat, a good healthy, clean crop, and would average about 40 bushels per acre. Oats very much down, had they not been so, they would have exceeded 70 bushels per acre. The Rye was a second crop, the first having been cut green in May and given to cattle. This second crop would be ripe about the 1st of September, and will be a fair crop, near 50 bushels. Clover and seeds very clean and good, both first and second crops. Old meadow, good thick herbage and in high condition. Some parts of the pastures (about half) very good, the remainder in fair condition. Fences properly trained and kept in proper bounds; they are old ones with ditches, and, as before stated, are sadly too full of timber trees. There has been but a small length of old hedges eradicated, or new ones planted. The gardens and orchards are well stocked and well cultivated. The whole premises are kept very neat, and the outbuildings are well arranged. The house and dairy very clean. The whole of the milk is converted into cheese, which appeared to be of first quality; the cheese-room was well stocked."

There are several other reports of prize farms, of which we may hereafter give extracts—meanwhile we recommend those interested in the agriculture of Lancashire and Cheshire to procure the Journal of the Society, and consider the propriety of assisting an institution which appears to be so active in pointing out and rewarding local energy and skill.

METEOROLOGICAL REPORT.—August—September.
(*Continued from p. 558.*)

| Date. | Time. | Max. | Min. | Wind and Weather. |
|---|---|---|---|---|
| Aug. 27 | 11 a.m. | 29.96 | ... | WSW. Brisk. Dull and cloudy. Heavy rain all the evening. |
| | 10 p.m. | ... | 29.70 | |
| * 28 | 6.35 a.m. | ... | 29.68 | AM. NW., P.M. NNW. Brisk. A cold comfortless day; barometer rising steadily. |
| | 10.20 p.m. | 29.77 | ... | |
| 29 | 7.30 a.m. | 29.70 | ... | Brisk NW. wind, with heavy showers all the forenoon; P.M. barometer rising rapidly, and fine pleasant afternoon and evening, with wind moderating. |
| † | 11.30 a.m | ... | 29.67 | |
| | 2.15 p.m. | ... | 29.68 | |
| | 10.30 p.m. | 29.86 | ... | |
| 30 | 6.15 a.m. | ... | 29.97 | N. A.M. Brisk breeze; fine pleasant day. |

| Sept. 1 | 7.40 a.m. | 30.15 | ... | WNW. Almost calm; fine. |
| | 5.50 p.m. | 30.12 | ... | WSW. Scud moving slowly; night densely overcast. |
| 2 | 7.50 a.m. | 30.05 | ... | A.M. WNW. Brisk; fine pleasant day. |
| ‡ | 5.10 p.m. | ... | 30.03 | P.M. NW. Do. |
| | 10.20 p.m. | 30.04 | ... | |
| 3 | 6.45 a.m. | 30.05 | ... | N.—NNE. Hot; thunder clouds; fine day. |

* A storm of considerable dimensions passing from west to east, the centre lying to the north of Scotland, from the extreme degree of cold which accompanied it.

† A storm passing from SW. to NW., but at a considerable distance to the west of Ireland.

‡ A storm of small dimensions coming from the westward, and crossing England to the eastward.

Dorchester, Sept. 4. *F. P. B. M.*

(*To be continued.*)

## Calendar of Operations.

### SEPTEMBER.

Lammermuir Sheep Farm, *Sept.* 1.—Circumstances having prevented us sending a report for July, our present must include two months. The principal business of the first was sheep shearing, which was completed under favourable circumstances, there being little or no rain to interfere with the work. Where the stock, as on such farms, is numerous, the shepherds would require a long time to get through them without assistance. To avoid this, two plans may be followed, either to hire extra hands, or procure assistance from the neighbouring farms. Both have their advantages and disadvantages, though the latter is the almost universal practice of this district, and that which we prefer. When men are hired, the work may certainly be better done, as a bad hand can be paid off at once. But as with us, where the population is thin, men are difficult to procure, and as they must be fed and lodged by the farmer, this inconvenience is greatly aggravated in the event of wet weather, when, of course, they must be idle. When you depend upon your neighbours for assistance, this cannot occur, as they can always judge on the appointed day whether to come or not; and, we must say, we have seldom had occasion to find fault with the way in which the work was done. We have indeed heard of cases, where both the sheep and the wool were seriously abused, but no wonder when the men were supplied with spirits *ad libitum*. Of course they get their meals in the farm-house, and let them have plenty of substantial fare, but give them neither whiskey nor beer. We have frequently been surprised that, in our border districts, there should scarcely—so far as we know—be such a thing as a regular wool-house attached to the farm steading, the wool being stowed away in barns, byres, or some such place equally dirty, damp, and unsuitable. This is certainly a grievous want, when the great importance of a carefully-managed clip and the large item in the returns arising from it are considered. We believe that the tenants are the principal parties to blame, long habit having reconciled them to what is so manifestly against their interest. But, surely, the landlord should look to this glaring want, and either at his own expense or with the assistance of the tenant (who, in most cases, will drive the materials at least) erect the necessary convenience. Our idea of such a building is—a house large enough to contain the clip without unnecessary packing and trampling, divided by moveable wooden screens into one or more compartments (according to the different kinds of wool, such as ewe, wether, and hogg), within which the fleeces can be neatly built up, with plenty of room and light to show it off to advantage, and enable buyers to examine it minutely. Some apparatus for assisting the packing will also be necessary; but, above all things, let it be perfectly dry. Wool may be and frequently is seriously damaged from damp, but never from being kept dry. Contrary to previous expectation, Cheviot wool is lower priced than last year, few mixed clips bringing above 1s. per lb. Blackfaced, on the other hand, is from ½*d.* to ¾*d.* per lb. higher. In our own case, the Cheviot is ½*d.* per lb. below, and the Blackfaced, ¾*d.* higher than last year; while the whole clip has weighed better than usual. On the arable part of the farm, the labourers have been very busy amongst the Turnips and haymaking. Having a considerably larger breadth of the former than usual, with about the same number of hands, it was no easy matter to get them thinned out in time; however, this was managed by the beginning of August. They are now being ploughed and horse-hoed, the workers following, cutting up weeds, removing double plants, and loosening the soil. Although only to a partial extent in this place, we had observed the depredations of the same caterpillar which has been working so much devastation in different parts of the kingdom. The frequent showers and lower temperature we have had of late, appears to have arrested their progress, besides causing the plants to grow amazingly fast. At present we have the prospect of a good crop. The weather has been very unfavourable for hay-making during the past month. We have still a good deal of work before us in this department, and will have a hard push to get through—light though the crop be—before harvest commences, which will hardly be until the 10th, being fourteen days later than last year. *A Lammermuir Farmer.*

## Notices to Correspondents.

Agricultural Statistics: *A Subscriber* should procure a small pamphlet, being a reprint from the *Economist*, entitled the "Price of Wheat in Europe: the Past a Test for the Future; and present Prices and present Stocks of Wheat in Europe. 1850." I think he will find in it the information he requires; should he not be able to procure it, I will send him one on receiving his address. *Thos. Davies, Snetherton, Lynn, Norfolk.*

Alsike Clover: *Cymro.* It is a hybrid perennial Clover.

Fenton Wheat: *C J W* may obtain it from any Edinburgh corn-dealer. Apply to Mr. C. Shirreff, corn-factor, Edinburgh. It is a short-strawed productive sort, fit for rich land.

Italian Rye Grass: *M H J.* In the second year you plough it up again, and grow some other green crop—as Tares, followed by Turnips, or Mangold Wurzel, and then it may do to sow Italian Rye Grass again.

Kohl Rabi: *M H.* Kohl Rabi need not be earthed up to the bulb. Raw bones uncrushed cannot be reduced by sulphuric acid alone, nor will they ferment with wet sand and ashes.

Lime: *R S.* Lime will take muriatic acid from the solution of common salt, and that would probably be the result of slaking with sea-water. Your compound would be a very deliquescent and caustic heap.

Peat Charcoal: *Constant Reader.* If we had a lot mixed with night-soil, we should keep it under cover till next spring and use it either on the young Wheat or on the Turnip land. If you must use it now, apply it for winter Beans, or Tares, or Rye, at the rate of 6 or 8 cwt. per acre.

Poultry: *A Sub* The disease of which you complain is roup, and only differs from the usual routine, by the speedy death of the patient, which generally becomes blind, or partially so, and lingers some time. I believe it is seldom cured, and in the latter stages is not worth trying. The best remedy I know is castor-oil given every other day—a dessert spoonful each dose. The fowl should be kept dry and warm, and fed on sopped bread or meal, mixed with some good strong ale. I have known two grains of calomel to do good, but I do not not think any remedy worth trying, after the disease has reached the stage where they become blind and refuse their food. It is very contagious, and sick birds should be immediately removed, or the sound ones will certainly catch it. The fowl in question has caught it from the common hens similarly affected, which would leave the disease behind, though they were removed. *J. Baily*, 113, *Mount-street — Y Y.* You say they have all died, and that the utmost attention was paid to them to no good purpose; but this information does not enable us to point out the cause of the disease.

Sulphuric Acid: *H P.* A brick-built tank will hold manure for being acted on by sulphuric acid. Apply it diluted in the proportion of about 1 to 4 or 5 of water; it will fix the ammonia, and thus destroy one of the principal causes of the smell. There is no information on the ammoniacal composition of manure which will enable us to say what quantity of ammonia yours, a mixture of all sorts, contains. You had better try the thing experimentally until you hit upon the right quantity to add.

Tares: *Anon.* Sow winter Tares in September—3 bushels per acre, in rows 8 inches apart. A good loam in good order will nevertheless pay for manuring. Apply 10 to 15 tons of farm dung per acre if you can.

## Markets.

### COVENT GARDEN, Sept. 6.

Peaches and Nectarines are not very plentiful; the best samples fetch 12s. a dozen. Pines and Grapes are abundant. Morello Cherries are nearly over. Greengage Plums are scarce, as are also Oranges and Lemons. Nuts remain nearly the same as quoted last week. Filberts are imported in quantity. Carrots, French Beans, and Peas are sufficient for the demand. Potatoes are good in quality, and, remain tolerably free from disease. Lettuces and other salading are sufficient for the demand. Mushrooms are scarce. Cut flowers consist of Heaths, Pelargoniums, Mignonette, Heliotropes, Stephanotis floribunda, Carnations, Pinks, Moss and Provins Roses.

FRUIT.

| | |
|---|---|
| Pine-apples, per lb., 3s to 6s | Apples, kitchen, p. bsh., 1s to 1s 6d |
| Grapes, hothouse, p. lb., 2s to 5s | Pears, dessert, p. doz., 2s to 5s |
| Peaches, per doz., 6s to 12s | Almonds, per peck, 6s |
| Nectarines, per doz., 6s to 12s | — sweet, per lb., 2s to 3s |
| Apricots, per doz., 4s to 6s | Lemons, per doz., 1s to 2s |
| Cherries, per lb., 6d to 2s | Oranges, per doz., 2s to 4s |
| Melons, each, 1s to 4s | — per 100, 14s to 30s |
| Currants, p. hf. sieve, 4s to 5s | Nuts, Barcelona, p. bsh, 20s to 22s |
| Plums, per punnet, 1s to 2s | — Brazil, p. bsh., 12s to 14s |
| Figs, per doz., 1s 6d to 3s | Filberts, per 100lbs., 55s to 65s |

VEGETABLES.

| | |
|---|---|
| Cabbages, per doz., 3d to 1s | Leeks, per bunch, 1d to 2d |
| Cauliflowers, p. doz., 6d to 3s | Shallots, per lb., 3d to 6d |
| French Beans, per half sieve, 1s to 2s | Garlic, per lb., 4d to 6d |

HOPS.—Friday, Sept. 5.

Messrs. Pattenden and Smith report that the market continues firm, with no alteration in prices. The duty is estimated from 110,000*l.* to 115,000*l.* About 30 pockets of new Hops have arrived, but being in a very unripe state do not find buyers.

SMITHFIELD, Monday, Sept. 1.

The number of Beasts was large, but the average quality very inferior, consequently a choice bullock made rather more money, and several middling ones remained unsold. The supply of Sheep and Lambs was about the same as of late; trade was brisk, but it was only for a few of the best descriptions that higher prices were made. Trade was somewhat better for Calves. From Holland and Germany there are 1300 Beasts, 4070 Sheep, 233 Calves, and 30 Pigs; from Spain, 700 Sheep; from Scotland, 60 Beasts; and 2540 from the northern and midland counties.

| Per st. of 8 lbs.— | s | d | s | d |
|---|---|---|---|---|
| Best Scots, Herefords, &c. | 3 | 4 | to 3 | 6 |

| Lambs ... | ... | 4 | 4 — 4 | 10 |
| Calves ... | ... | 2 | 8 — 3 | 8 |
| Pigs ... | ... | 2 | 8 — 3 | 8 |

Beasts, 4679; Sheep and Lambs, 33,260; Calves, 335; Pigs, 385.

Friday, Sept. 5.

We have a large supply of foreign Beasts. A bad trade at the dead markets since Monday causes a slack attendance of buyers. Prices for all kinds are lower, and a clearance cannot be effected. The number of Sheep is small, sufficient, however, for the time of year; they are making about the same as on Monday. Calves are very plentiful, and are sold lower. From Germany and Holland we have 602 Beasts, 1830 Sheep, 378 Calves, and 34 Pigs; from Spain, 200 Sheep; from Scotland, 20 Beasts; 320 from the northern and midland, and 125 milch cows from the home counties.

| Best Scots, Herefords, &c. | ... 3 | 2 to 3 | 4 |
|---|---|---|---|
| Best Short-horns | 3 | 0 — 3 | 2 |
| 2d quality Beasts | 2 | 4 — 2 | 10 |

| Pigs ... | ... | 2 8 — 3 | 8 |

MARK LANE.

Monday, Sept. 1.—There was a fair supply of Wheat (new) from Essex and Kent at market this morning, quality very fine, and disposed of on the terms of this day se'nnight. In the value of foreign we observe no alteration, but the business doing is exceedingly limited.—For Barley, Beans, and Peas, late prices are fully supported.—Oats are in good demand, and in some instances a slight advance is obtained.—The price of Flour is entirely nominal.

| Per Imperial Quarter, | s. s. | | s. s. |

| Irish | | — | — | 30 | 35 | — | — |
| Foreign | | 8297 | — | — | 11460 | — | — |

Friday, Sept 5.—We have been moderately supplied with grain, either English or foreign, since Monday; nevertheless, there was no activity in the trade this morning, and the value of all articles must be written nominally as on that day, Oats being held for a slight advance. There is a little more demand for Flour at late rates. For a cargo of P.O. Wheat arrived on the coast 31s. per qr. has been accepted. Galatz Maize was sold at 26s. 6d. per qr., both f. o. b., including freight and insurance.—The weather during the past week has continued unsettled, preventing much progress being made with the harvest in Scotland and those districts in which the Wheat has not yet been carried. On Wednesday here, as also in Liverpool and some of the northern markets, more disposition than of late has been evinced by the trade to get into stock, where it was practicable on about the reduced terms at which forced sales have been lately effected.

Arrivals this Week.

Liverpool, Tuesday, Sept. 2.—There was a fair attendance of both town and country dealers at our market this morning, and a good general demand was experienced for all sorts of bread stuffs. In Wheat, Oats and Indian Corn there was no alteration in price, except in some forced sales of foreign Wheat, upon which a reduction of 1d. to 2d. per 70 lbs. was submitted to. Barley, Beans, and Peas were in good request, but Malt was 1s. per qr. cheaper.—Friday, Aug. 29.—Our supplies coastwise and from Ireland since Monday last are quite insignificant, and the arrivals from abroad very moderate. Notwithstanding the weather still bears an unsettled aspect, no excitement was apparent in any department of the trade at our market to-day. Having no supplies of new Wheat at hand, the sales of that grain this morning were restricted to limited parcels of good foreign, which barely sustained previous rates. Barley, Malt, and Peas, continuing to attract very little attention, were severally rather depressed in value. Beans, including Egyptians, were offered with little effect at a decline of 6d. per qr. Oats, being extremely scarce, were the turn dearer, and Oatmeal fully as dear as before, the stock of old being nearly if not wholly exhausted. Indian Corn on the spot was taken rather sparingly to-day, but maintained late prices.

*SALE BY AUCTION.*

ISLINGTON NURSERY.—TO NOBLEMEN, GENTLEMEN, NURSERYMEN, BUILDERS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed by the proprietor to offer to public competition, by Auction, early in October, on the premises, in consequence of the land being Let for building, the whole of the valuable NURSERY STOCK, comprising several thousand Scarlet, White, and Hybrid Rhododendrons, Gnent and other Azaleas, Variegated and Green Hollies of various sizes, in considerable quantities, several thousand Aucuba japonica from 1 to 4 feet, a large quantity of fine Mulberries of different ages, many of which are fine bearing trees, &c. Further particulars in future Advertisements.

American Nursery, Leytonstone, Essex, September 6.

---

TO BE SOLD, the Lease and Good-will, Greenhouses, Lights, Potting Shed, Plants, Pots and Stock, of a FLORIST deceased situate in the Alpha Road, Regent's Park. —Apply to Mr. SKEET, West Lodge, Portman Market, London.

---

TO FLORISTS, GARDENERS, &c.

TO BE SOLD, the Lease of TWO COTTAGES, with Outbuildings, and nearly Four Acres of Land, well stocked with Fruit Trees in full bearing (near town).—For further particulars, inquire of A. B., by letter, care of Mr. E. Watling, 409, Strand, London.

---

TO BE SOLD, the valuable Lease of an old-established NURSERY, commandingly situated within two miles of London, consisting of about two acres, and 18 Glass Erections, viz., Houses and Pits heated with hot-water apparatuses, with a fine stock of various Plants, &c.—For cards to view, apply at the Office of this Paper.

---

TO SEEDSMEN AND FLORISTS, HERBALISTS, AND DRUGGISTS.

TO BE DISPOSED OF, a genuine, well established Business in the above lines, in one of the very best situations in London, being a corner house in the High-street of a densely populated thoroughfare.

The Proprietor being compelled to dispose of the above solely in consequence of ill health, the Good-will, Fixtures, Utensils in business, together with the entire Stock, may be had considerably under value.—For particulars, apply to JAMES OVERTON, Esq., 9, Union-court, Old Broad-street, City, London.

---

ELIGIBLE FARM TO LET IN GLAMORGANSHIRE.

TO BE LET, on lease, or yearly tenancy, Lanfa Farm, situated about 3 miles from Bridgend, comprising 410 acres of excellent Meadow, Pasture, and Arable Land. The Farm is now in the occupation of the Proprietor, and is in a good state of cultivation. The extent may be considerably increased, if desired, by the addition of adjoining land. Nearly 70 acres of old Meadow Land have lately been brought into cultivation. Bridgend, from its contiguity to the mineral district, has a good market weekly, for the sale of all descriptions of agricultural produce.—For further particulars apply to Mr. EVAN W. DAVID, Radyr-court, Cardiff

---

A DETACHED HOUSE, WITH GARDEN GROUND AND ORCHARD, AT KINGSTON-ON-THAMES, near the entrance to Richmond Park. Public conveyances passing the door, and 1½ mile from the Railway Station.

TO BE LET, for 6½ years, a comfortable DWELLING-HOUSE, containing two cheerful Sitting-rooms and four Bed-rooms (with an unfinished apartment, intended for three additional Bed-rooms on the first floor), an excellent Kitchen, Store-rooms, Cellars, and a Scullery, with supply of fine Water. The House stands in about five acres of rich Garden Ground, part of which is fully stocked with choice Fruit Trees, adapted by position and soil for cultivation, with some Detached Buildings useful for such purpose; a two-stall Stable, &c. Immediate possession may be had.—For particulars, apply at Mr. JOHN DAWSON'S Auction and Land Offices, Kingston, Surrey; and 49, Pall-mall, London.

---

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

---

NEW SHOW ROOMS FOR BEDSTEADS.

HEAL AND SON have erected some extensive Warerooms for the purpose of keeping every description of Bedsteads. In Iron their stock will include every sort manufactured, from the cheap Stump, for servants' use, to the handsomely ornamented tubular-pillared Canopy, as well as Brass Bedsteads of every shape and pattern; and in wooden Bedsteads their Rooms are sufficiently extensive to allow them to fit up a variety, both in Polished Birch and Mahogany, of Fourpost, Canopy and French, and also of Japanned Bedsteads—in fact, to keep in Stock every sort of Bedstead that is made; and they have also a general assortment of Furniture, Chintzes, Damasks, and Dimities, so as to render their Stock complete for the Furnishing of Bedsteads as well as Bedding. And without attempting to compete with the prices at which the lowest class of Furniture is sold, and which is fit for no useful purpose, their new Stock will be found to be priced on the same principle by which their Bedding trade has, during the last 30 years, been so successfully extended, and the goods, whether of a plain and simple pattern, or of a handsomer and more expensive character, are of well-seasoned materials, sound workmanship, and warranted.

HEAL and SON'S list of Bedding, containing full particulars of Weight, Sizes, and Prices of every description of Bedding, sent free by post, on application at their Factory,

196 (opposite the Chapel), Tottenham Court Road, London.

---

TRAVELLERS AND VISITORS TO THE SEA-COAST would do well to provide themselves with a bottle of ROWLANDS' AQUA D'ORO. This fragrant and spirituous perfume refreshes and invigorates the system during the heat of summer, and will be found an essential accompaniment for the opera, the public assembly, and the promenade. In all cases of excitement, lassitude, or over exertion, it will prove of great advantage taken as a beverage, diluted with water. Price 3*s.* 6*d.* per bottle.

ROWLANDS' KALYDOR will also prove a most refreshing preparation for the complexion, dispelling the cloud of languor and relaxation, allaying all heat and irritability, and immediately affording the pleasing sensation attending restored elasticity and healthful state of the skin. Freckles, Tan, Spots, Pimples, and Discolorations are effectually prevented and eradicated by its application; and in cases of sunburn, stings of insects, or incidental inflammation, its virtues are universally acknowledged. Price 4*s.* 6*d.* and 8*s.* 6*d.* per bottle.

Sold by A. ROWLAND & SONS, 20, Hatton Garden, London, and by Chemists and Perfumers.

*** Beware of SPURIOUS IMITATIONS. The genuine article has the words "ROWLANDS' KALYDOR" on the wrapper.

---

M'CORMICK'S PATENT AMERICAN REAPER received the award of the GREAT MEDAL, Exhibition, 1851.—The sole agency for the above having been confided to us, we beg to inform Agriculturists and the Public that we are prepared to receive orders and to appoint district Agents for the sale of the Machines.

BURGESS and KEY, 103, Newgate-street, London.

A Trial of the Machine will take place at Leicester on the 9th inst., and at Lancaster on the 10th or 11th inst.

---

LIGHT, CHEAP, AND DURABLE ROOFING.

CROGGON'S PATENT ASPHALTE ROOFING FELT, an inodorous felt for damp walls, sold in rolls 32 inches wide, 1*d.* per square foot; also dry Hair Felt, for preventing the radiation of heat and deadening sound, and Sheathing for ships' bottoms, on which the copper lies smooth. Samples, directions, and testimonials, sent by post.—CROGGON and Co, Dowgate-hill, London.

---

EDUCATION.—The Advertiser, being in want of a PUPIL TEACHER for a School in which Practical Agriculture and Agricultural Chemistry are taught, is prepared to receive into his family a youth to act in that capacity. This will be found an excellent opportunity for any one anxious to secure for a youth a good education at a trifling cost.—Full particulars may be known by applying to J. S., Post-office, Cheadle, Staffordshire.

---

TO PARENTS AND GUARDIANS.

AGRICULTURAL EDUCATION.—A Farmer, of considerable experience, in a well-managed Agricultural district, is desirous of receiving into his family one or two young gentlemen, whose friends wish that they should be acquainted with the practice of Agriculture.—Direct to H. M., at the Office of this Paper.

---

It is 2¼ yards wide, and of any required length, at 1*s.* 4*d.* per yard run.—Manufactured only by E. T. ARCHER, Carpet Manufacturer, 451, New Oxford-street, London.

---

THE HAIR.—LOST AND RESTORED.—

"Newport, Isle of Wight, Sept. 6, 1848.

"Gentlemen,—Some three months since, finding my hair falling off by nearly handsful, and my head approaching baldness; in fact, being quite bald at the crown and on the sides, I was induced, through my hairdresser, Mr. Beach, of this place, to try your BALM OF COLUMBIA, and after persevering with four bottles, according to your directions, I found a new crop produced, which has now restored my head to its former appearance. As I had apprehended a total loss of my hair, I feel it due to the virtues of your Balm of Columbia thus publicly to bear my testimony. Mr. Beach, who recommended me, is the same who used it successfully in Mr. Wilson's case, whose testimony you have lately published. Mr. B. is a Lymington man; I am also a native of that place, though for the last ten years in practice here as a solicitor.—Yours, &c. H. RICE.

"To Messrs. C. & A Oldridge."

For the strengthening of weak hair, its restoration when thinly scattered, or falling off and consequent general improvement and embellishment, the powers of OLDRIDGE'S BALM OF COLUMBIA are known by the continually increasing numbers who are testing its merits, as powerfully and unfailingly efficient.—Price 3*s.* 6*d.*, 6*s.*, and 11*s.* per bottle. No other prices are genuine. Ask for OLDRIDGE'S BALM, and never be persuaded to use any other article as a substitute.

13, Wellington-street North, seven doors north of the Strand.

---

TO VISITORS FROM THE COUNTRY.

MECHI'S SHOW ROOMS, 4, LEADENHALL-STREET. —All persons of taste should hasten to inspect the unique and recherché STOCK of ELEGANCIES now exhibited by MECHI, in his new SHOW ROOMS, 4, LEADENHALL-STREET, near the India House. Determined to take the lead in taste, he has brought out some most superb and novel specimens in Papier-mâché. Finding it impossible to display them advantageously in his former space, he has fitted up another splendid Show Room, to which he invites those who are desirous of seeing the most brilliant specimens this country can produce. MECHI has the best stock in London of Ladies' and Gentlemen's Dressing-cases, Work-boxes, Writing-desks, and everything for the Toilet and Work Table.—4, Leadenhall-street.—Illustrated Catalogues gratis.

---

THE GREAT EXHIBITION.—A valuable, newly invented very small powerful Waistcoat-pocket Glass, the size of a Walnut, to discern minute objects at a distance of from four or five miles, which is found to be invaluable at the Exhibition, and to SPORTSMEN, GENTLEMEN, and GAME-KEEPERS. TELESCOPES.—A new and most important INVENTION in TELESCOPES, possessing such extraordinary powers, that some, 3½ inches, with an extra eye-piece, will show distinctly Jupiter's moons, Saturn's ring, and the double stars. They supersede every other kind, and are of all sizes—for the Waistcoat-pocket, Shooting, Military purposes, &c. Opera and race-course Glasses, with wonderful powers; a minute object can be clearly seen, from 10 to 12 miles distant.—In valuable newly-invented preserving Spectacles, invisible and all kinds of acoustic instruments for relief of extreme deafness. Messrs. S. and B. SOLOMONS, Opticians and Aurists, 39, Albemarle-street, Piccadilly, opposite the York Hotel, London.

---

METCALFE'S ALKALINE TOOTH POWDER, 2*s.* per box.

CAUTION.—Beware of the words "From METCALFE'S," adopted by some houses.

---

PARR'S LIFE PILLS are acknowledged to be the best Medicine in the World. 30,000 boxes sold weekly.—The fine balsamic and invigorating powers of this Medicine are truly wonderful; a trial of a single dose will carry a conviction that they are all that is necessary to invigorate the feeble, restore the invalid to health, and to do good in all cases. The heads of families should always have them in the house, as they may, with the greatest confidence, be resorted to at any time or in any case. BILIOUS DISORDERS.—These Pills are all-powerful in removing the distressing symptoms attendant upon bilious obstructions, disordered state of the stomach and bowels, such as pains in the head, dizziness of sight, sickness, oppression of the chest, lowness of spirits, disinclination for active employment, and various other symptoms at all times troublesome, and not unfrequently dangerous. By taking two or three doses of OLD PARR'S LIFE PILLS, the symptoms above described are speedily removed, an unusual degree of serenity pervades the mind, the stomach and bowels are restored to their natural functions, and returning vigour is the result. None are genuine unless the words "PARR'S LIFE PILLS" are in White Letters on a Red Ground, on the Government Stamp, pasted round each box; also the fac simile of the signature of the Proprietors, "T. ROBERTS and Co., Crane-court, Fleet-street, London," on the Directions. Sold in boxes at 1*s.* 1*d.*, 2*s.* 9*d.*, and family packets at 11*s.* each.

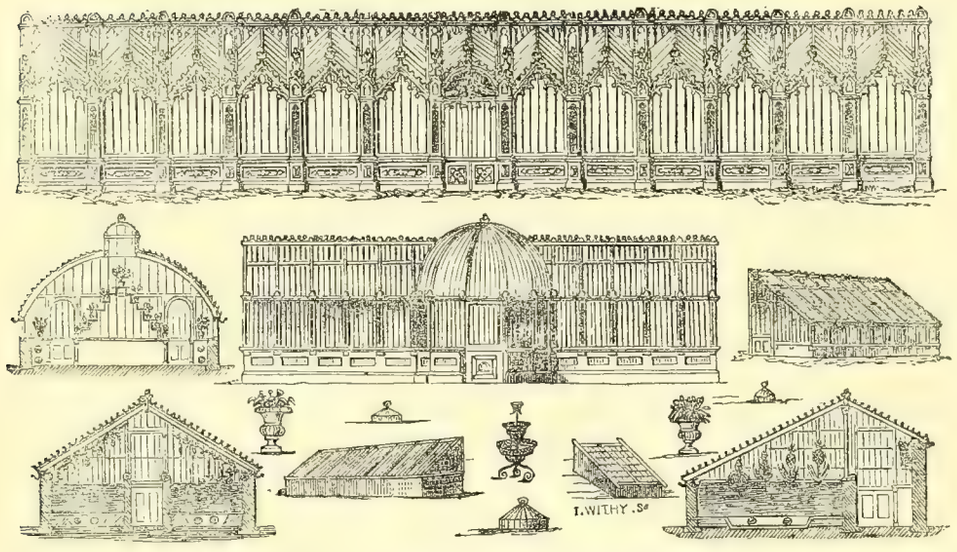
COMFORT FOR TENDER FEET, AND A CERTAIN CURE FOR CORNS AND BUNIONS.

PAUL'S EVERY MAN'S FRIEND,

Patronised by the Royal Family, Nobility, &c.

PAUL'S EVERY MAN'S FRIEND, which gives relief on the first application. Paul's Every Man's Friend (Corn Plaister) is generally admitted to be the best emollient application for Corns and Bunions, and is worthy of a trial on the part of those who are afflicted with such unpleasant companions. Testimonials have been received from upwards of 100 physicians and surgeons of the greatest eminence, as well as from many officers of both army and navy, and nearly 1000 private letters from the gentry in town and country, speaking in high terms of this valuable remedy.

Prepared by JOHN FOX, in boxes, 1*s.* 1½*d.*, or three small boxes in one for 2*s* 9*d.*; and to be had, with full directions for use, of all wholesale and retail Medicine Vendors in town and country. The Genuine has the name of "JOHN FOX" on the Government Stamp. A 2*s.* 9*d.* box cures the most obdurate Corns. Ask for "Paul's Every Man's Friend."



Sold by Barclay and Sons, Farringdon-street; Edwards, 67, St. Paul's Churchyard; Butler and Harding, 4, Cheapside; Newberry, St. Paul's; Sutton, Bow Churchyard; Johnston, 68, Cornhill; Sanger, 150, Oxford-street; Willoughby and Co., 61, Bishopsgate-street Without; Eade, 39, Goswell-street; Prout, 229, Strand; Hannay and Co., 63, Oxford-street; Watts, 106, Edgeware-road; and retail by all respectable Chemists and Medicine Vendors in every Town in England. UNITED KINGDOM LIFE ASSURANCE COMPANY, 8, Waterloo-place, Pall-mall, London; 97, George-street, Edinburgh; 12, St. Vincent-place, Glasgow; 4, College-green, Dublin.

LONDON BOARD.

Chairman.—CHARLES GRAHAM, Esq.

Deputy Chairman.—CHARLES DOWNES, Esq.

| | |
|---|---|
| H. Blair Avarne, Esq. | J. G. Henriques, Esq. |
| E. L. Boyd, Esq., Resident. | F. C. Maitland, Esq. |
| Charles B. Curtis, Esq. | William Railton, Esq. |
| William Fairlie, Esq. | F. H. Thompson, Esq. |
| D. Q. Henriques, Esq. | Thomas Thorby, Esq. |

This Company, established by Act of Parliament in 1834, affords the most Perfect Security in a large paid-up Capital, and in the great success which has attended it since its commencement.

The Bonus added to Policies from March, 1834, to the 31st December, 1847, is as follows:—

| Sum Assured | Time Assured. | Sum add. to Pol. in 1841 | Sum added to Pol. in 1848. | Sum Payable at Death. |
|---|---|---|---|---|
| £5000 | 13 yrs 10 mts | £638 6 8 | £787 10 0 | £6470 16 8 |
| 5000 | 1 year | ..... | 112 10 0 | 5112 10 0 |
| 1000 | 12 years | 100 0 0 | 157 10 0 | 1257 10 0 |
| 1000 | 7 years | ..... | 157 10 0 | 1157 10 0 |
| 1000 | 1 year | ..... ..... | 22 10 0 | 1022 10 0 |
| 500 | 12 years | 50 0 0 | 78 15 0 | 628 15 0 |
| 500 | 4 years | ..... | 45 0 0 | 545 0 0 |
| 500 | 1 year | ..... | 11 5 0 | 511 5 0 |

* EXAMPLE.—At the commencement of the year 1841, a person aged 30 took out a policy of 1000*l.*, the Annual Payment for which is 24*l.* 1*s.* 8*d.*; in 1847, he had paid in Premiums 160*l.* 11*s.* 8*d.*; but the profits being 2½ per cent. per annum on the sum insured (which is 22*l.* 10*s.* per annum for each 1000*l.*), he had 157*l.* 10*s.* added to the Policy, almost as much as the Premiums paid.

The Premiums, nevertheless, are on the most moderate scale, and only one-half need be paid for the first five years, when the Insurance is for Life. Every information will be afforded on application to the Resident Director, 8, Waterloo-place, Pall-mall, London.

---

UNIVERSAL LIFE ASSURANCE SOCIETY, ESTABLISHED 1834.

EMPOWERED BY SPECIAL ACT OF PARLIAMENT.

1, KING WILLIAM-STREET, LONDON.

For the Assurance of Lives at Home and Abroad, including Gentlemen engaged in the Military and Naval Services.

The principle adopted by the Universal Life Assurance Society of an annual valuation of assets and liabilities, and a division of three-fourths of the profits among the assured, is admitted to offer great advantages; especially to those parties who may wish to appropriate their proportion of profit to the reduction of future premiums.

The following table will show the result of the last division of profits, as declared on the 14th of May, 1851, to all persons who had on that day paid six annual premiums, being a reduction of 45 per cent. on the current annual premium. This will be found a most liberal reduction, if the original premiums be compared with those of other offices adopting a similar plan of division of profits:—

| Age when Policy was issued. | Date of Policy. | Sum assured. | Original Premium. | Reduced Annual Premium for the current year. |
|---|---|---|---|---|
| 20 | On or before 14th of May, 1846. | £1000 | £19 6 8 | £10 12 8 |
| 30 | | 1000 | 24 8 4 | 13 8 7 |
| 40 | | 1000 | 31 10 0 | 17 6 6 |
| 50 | | 1000 | 42 15 0 | 23 10 3 |
| 60 | | 1000 | 66 11 8 | 36 12 5 |

Agents in India: Messrs. BRADDON and Co., Calcutta; Messrs. BAINBRIDGE and Co., Madras; Messrs. LECKIE and Co., Bombay.

MICHAEL ELIJAH IMPEY, Secretary.

---

ARGUS LIFE ASSURANCE COMPANY, 39, THROGMORTON STREET, BANK, and 14, PALL MALL.

*Chairman*—Thomas Farncomb, Esq., Alderman.

*Deputy-Chairman*—William Leaf, Esq.

| | |
|---|---|
| Richard E. Arden, Esq. | Rupert Ingleby, Esq. |
| Edward Bates, Esq. | Thomas Kelly, Esq., Ald. |
| Thomas Camplin, Esq. | Jeremiah Pilcher, Esq. |
| James Clift, Esq. | Lewis Pocock, Esq. |
| J. Humphery, Esq., Ald., M.P. | |

*Auditors*—Professor Hall, M.A.; J. B. Shuttleworth, Esq.

*Physician*—Dr Jeaffreson, 2, Finsbury-square.

*Surgeon*—W. Coulson, Esq., 2, Frederick's-place, Old Jewry.

*Consulting Actuary*—Professor Hall, M.A., of King's College.

*Solicitor*—William Fisher, Esq, 19, Doughty-street.

ADVANTAGES OF ASSURING WITH THIS COMPANY.

In addition to a large subscribed capital, policy holders have the security of an assurance fund of Three Hundred and Twenty Thousand Pounds, and an income of Seventy-four Thousand Pounds a year, arising from the issue of upwards of 7000 Policies.

BONUS OR PROFIT BRANCH.

Persons assuring on the Bonus system, will be annually entitled to 80 per cent. of the profits on this branch (after payment of five yearly premiums); and the profits assigned to each Policy may either be added to the sum assured, or applied in reduction of the annual premiums.

NON-BONUS, OR LOW PREMIUM, BRANCH.

The Tables on the non-participating principle afford peculiar advantages to the assured, not offered by any other office—for where the object is the least possible outlay, the payment of a certain sum is secured to the policy holder, on the death of the assured, at a reduced rate of premium.

| | Premiums to Assure £100. | | Whole Term. | |
|---|---|---|---|---|
| Age. | One Year. | Seven Years. | With Profits. | Without Profits. |
| 20 | £0 17 8 | £0 19 1 | £1 15 10 | £1 11 10 |
| 30 | 1 1 8 | 1 2 7 | 2 5 5 | 2 0 7 |
| 40 | 1 5 0 | 1 6 9 | 3 0 7 | 2 14 10 |
| 50 | 1 14 1 | 1 19 10 | 4 6 0 | 4 0 11 |
| 60 | 3 2 4 | 3 17 0 | 6 12 9 | 6 0 10 |

One-half of the Whole Term Premium may remain on credit for seven years, or one-third of the Premium may remain for life as a debt upon the Policy at 5 per cent., or may be paid off at any time without notice.

Claims paid in one month after proofs have been approved.

Loans upon approved security.

The Medical Officers attend every day at Throgmorton-street, at a quarter before 2 o'clock. E. BATES, Resident Director.

---

THE YORKSHIRE FIRE AND LIFE INSURANCE COMPANY.

Established at York, 1824. Empowered by Act of Parliament. Capital 500,000*l.*

*Trustees*—Lord WENLOCK, Escrick Park.
G. L. THOMPSON, Esq., Sheriff-Hutton Park.
ROBT. SWANN, Esq., York.

*Bankers*—Messrs. SWANN, CLOUGH, and Co., York.

*Actuary and Secretary*—Mr. W. L. NEWMAN, York.

The attention of the public is particularly called to the terms of this Company for LIFE INSURANCES, and to the distinction which is made between MALE and FEMALE Lives.

Extract from the Table of Premiums for Insuring 100*l.*

| Age next birthday. | Whole Life Premiums. A Male. | A Female. | Age next birthday. | Whole Life Premiums. A Male. | A Female. |
|---|---|---|---|---|---|
| 10 | £1 7 6 | £1 5 4 | 46 | £3 11 6 | £3 3 2 |
| 13 | 1 9 3 | 1 7 0 | 50 | 4 1 9 | 3 13 3 |
| 16 | 1 11 3 | 1 8 10 | 53 | 4 11 6 | 4 2 6 |
| 20 | 1 14 4 | 1 11 6 | 56 | 5 4 0 | 4 14 0 |

| 43 | 3 5 3 | 2 17 2 | 80 | ... | 15 12 10 |

* *Example.*—A Gentleman whose age does not exceed 30, may insure 1000*l.*, payable on his decease, for an annual payment of 22*l.* 10*s.*; and a Lady of the same age can secure the same sum or an annual payment of 19*l.* 17*s.* 6*d.*

Prospectuses, with the rates of premium for the intermediate ages, and every information may be had at the Head Office in York, or of any of the Agents.

FIRE INSURANCES are also effected by this Company, on the most moderate terms.

Agents are wanted in those Towns where no appointments have been made. Applications to be made to Mr. W. L. NEWMAN, Actuary and Secretary, York; or to Mr. HENRY DINSDALE, 12, Wellington-street, Strand, Agent for London.

NATIONAL FLORICULTURAL SOCIETY, 21, REGENT-STREET.

The TWELFTH MEETING will be held at Two o'clock on THURSDAY next, the 18th instant. All subjects for examination must be entered, staged, and labelled by 12 o'clock.

A ballot will take place for the election of two candidates—Mr. Drummond, Florist, Bath, and Mr. Wheeler, Nurseryman, Warminster.

The Committee take the present opportunity of reminding some few members who have neglected to forward their subscriptions, that it is important they remit without further delay, so as to save the Honorary Secretary the labour of writing for the same.

By order, JOHN EDWARDS, Hon. Secretary.

NORFOLK AND NORWICH HORTICULTURAL SOCIETY.—A Grand DAHLIA EXHIBITION will be held at St. Andrew's Hall, Norwich, on WEDNESDAY, the 17th September, 1851, open to Amateurs, being members, and Nurserymen, in all England. Prize List, and every information, on application to WILLIAM HUSSEY, Secretary.

Horticultural Gardens, Norwich, Sept. 13.

MYATT'S NEW SEEDLING STRAWBERRY, "CINQUEFOLIA."—The character of this Strawberry is quite distinct, having generally five leaves on each footstalk. The trusses are strong, producing an abundance of large fruit of a fine flavour. For general description, see *Gardeners' Chronicle*, of July 12th, and "Gardeners' Journal," of July 19th. Plants of this variety 50*s*. per 100; also Myatt's Surprise, 21*s*.; British Queen, Eleanor, Globe, Deptford Pine, Mammoth, Eliza, Fertilised Hautbois, Hooper's Seedling, Keen's Seedling, Swainstone Seedling, Elton Pine, Black Prince, Bicton Pine (white), 3*s*. 6*d* per 100. Kitley's Goliah, 5*s*.; Jackson's Britannia, 5*s*.—Post-office orders are requested to be made payable to JOSEPH MYATT, Manor Farm, Deptford, Kent.—Sept. 13.

BECK'S SEEDLING PELARGONIUMS OF 1850.

JOHN DOBSON'S Descriptive Catalogue of New and First-rate PELARGONIUMS can be had by enclosing one postage stamp.—Woodlands Nursery, Isleworth, Sept. 13.

NEW ROSES.

WILLIAM WOOD AND SON have the pleasure of announcing that their DESCRIPTIVE CATALOGUE OF ROSES is now ready, and will be forwarded to all who have patronised them, and post free to all applicants. Such extensive addition has been made to their Stock, that they are able to execute orders of any magnitude with good Plants and without substitutions.

The above can be obtained in London of Messrs. NIXON, 123, Great Portland-street, Oxford-street; of Messrs. HURST and M'MULLEN, 6, Leadenhall-street; and of Mr. CARTER, 238, High Holborn. And at the Nursery the following: a Catalogue of Ornamental Trees and Shrubs, including a fine collection of Coniferæ and choice Herbaceous Plants; and a Descriptive Catalogue of New and Select Fruits. The Trade Catalogue is also now ready.

Woodlands Nursery, Maresfield, Uckfield, Sussex.

RARE AND UNEQUALLED COLLECTION OF HEALTHY PINE PLANTS.—The whole of the Stock, as at present growing in the Gardens at Blenheim, consisting of One Hundred and Fifty splendid Fruiting Pines. These should produce Pines from 5 to 8 lbs. each, in May and June next, and 300 fine healthy succession Plants. The following are the sorts: Providences, Cayennes, Black Jamaicas, Enville, Antiguas, and Queens.—Application to treat for the same to be made to Mr. TURNBULL, Gardener, Blenheim, Woodstock, Oxon.

BRITANNIA STRAWBERRY.—The combined excellencies of this STRAWBERRY are robust habit, an abundant bearer, good flavour, large size, and of a deep scarlet colour, season of ripening late. See the *North British Agriculturist*, August 8, of last year.—Strong plants of this superb Strawberry are now ready for sale, price 30*s*. per 100, on application to SAMUEL JACKSON, Gardener, Marfleet-lane, Hull. A Post-office order is requested on the receipt of plants. The usual allowance to the trade.

SANGSTER'S NEW EARLY No. 1 PEA.

HAY, SANGSTER, AND CO., in submitting the above valuable PEA to the public, can recommend it with the greatest confidence, as the largest podded and best Early Pea known, and of first-rate quality; height, 2 feet. Price 2*s*. 6*d*. per quart.

York Regent Potatoes, from prepared cuttings, 6*s*. per bush. Cambridge Radical do. (a first-rate second early) 6*s*. do. Early Oxford do., 10*s*. 6*d*. do. Early Ebrington Kidney do., 10*s*. 6*d*. do. Early Ash-leaf Kidney do., 10*s*. 6*d*. do.

Post-office orders to be made payable at the Borough Post-office to HAY, SANGSTER, and Co., Nursery and Seedsmen, Newington Butts, London. One-bushel hampers and booking, 1*s*. 6*d*.; two-bushel, 2*s*. 6*d*. Sacks, 2*s*. 6*d*. each.

THE AMERICAN NURSERY, BAGSHOT, SURREY.

JOHN WATERER begs to announce that he has just published a new CATALOGUE of Hardy Rhododendrons, Azaleas, Roses, Conifers, &c., and which may be obtained by enclosing two postage stamps.

*** The Colours of all the Rhododendrons worthy of cultivation are described; thus purchasers are afforded every facility in making selections.

DUTCH FLOWER ROOTS.—The Undersigned have great pleasure in announcing to their patrons and the public, that their annual importation of the above has just arrived in excellent condition. The roots are of the best quality, and will be sold at as reasonable prices as by any respectable house in London. Catalogues may be had on application.

Clapton Nursery, London, Sept. 13. HUGH LOW and Co.

WILLIAM HAMILTON, SEEDSMAN, &c., 156, Cheapside, London, will forward his CATALOGUE of BULBOUS ROOTS (of which he has a large collection), on application.

W. D. having a very large stock of Flower Roots (*the finest that can be imported*), respectfully solicits the attention of ladies and gentlemen about to purchase their annual supply of Bulbs, feeling assured his prices and quality will give satisfaction.

Where quantities are taken, a liberal allowance made. A Descriptive Priced Catalogue may be had on application.

LILIUM GIGANTEUM.—A few fine healthy Tubers of this magnificent Nepaul Lily have been sent to Messrs VEITCH by Mr. T. Lobb, who collected them in their native habitat, and who speaks of it as the finest of all the Lilies he has ever seen. The flowers are white, of great size, and produced in abundance.

Dr. LINDLEY says, "Lilium Giganteum is a very fine thing; it will perhaps be as hardy as the Japan Lily."

Sir W. J. HOOKER also says, "It is a very fine large flowered species, figured by Dr. Wallich in Flora of Nepaul; the flowers are nearly white, and half a foot long, leaves very large and heart-shaped."

The Plants now offered are growing luxuriantly, and in excellent condition.

GUERNSEY AND BELLADONNA LILIES

B. PAGE AND CO. have the pleasure to offer FINE FLOWERING BULBS of the above beautiful Autumnal Lilies.

| | Per dozen.—*s*. | *d*. |
|---|---|---|
| GUERNSEY LILIES | 4 | 0 |
| BELLADONNA DITTO | 4 | 0 |
| EARLY DOUBLE ROMAN NARCISSUS | 4 | 0 |
| LARGEST DOUBLE JONQUILS | 4 | 0 |

B. P. and Co. have received their ANNUAL IMPORTATION of DUTCH BULBS in the finest possible condition, which they are able to offer at greatly reduced rates, priced Catalogues of which may be had upon application to PAGE and Co., Seed Merchants, Southampton.

H. CORSTEN, Florist and Seedsman to her Most Gracious Majesty the QUEEN, and H. R. H. PRINCE ALBERT, 8, Grand Hall, Hungerford Market, begs most respectfully to thank the nobility, gentry, and public in general, for the favours conferred on him last season of purchasing his cases containing a collection of Dutch Flower Roots. He begs to inform his patrons that he has just received his great annual collection of DUTCH and other BULBS, which includes a great many new and rare varieties never before imported to this country.

Boxes at 5*l*. contain 50 named Hyacinths, various colours, double and single, suitable for glasses, pots, or beds; 50 varieties of Tulips, double and single, early or late sorts; 50 Bouquet Narcissus, a great many will produce more than 30 to 40 blossoms; 50 True Jonquils, scented, double and single; 50 Iris Anglica, in all colours, many of the sorts have gained medals and certificates of merit; 50 Iris Hispanica, in beautiful colours; 50 double Anemones, the rare and large blossoms of which have been admired; 50 double Ranunculus, under which are the splendid spotted and striped, white, red, and rose Seedlings; 12 very large crown Imperials, magnificent in their blooms; 50 Hybrid Gladiolus, of which the blossoms have been exhibited at H. C.'s during this month, and have been much admired for beauty and colour; 100 of the new large purple Crocus; 100 do., yellow; 100 do, white; 100 do., striped, in many varieties, and 8 large Bulbs from Naples.

Every Bulb is warranted true to name and colour. Roots given in to defray the carriage.

Half boxes can be had at 2*l*. 10*s*.; quarter box, 1*l*. 5*s*. Early applications will secure the most valuable and rare sorts.—Post-office Orders made payable to HENRY CORSTEN, Charing Cross Post-office, London. A remittance required.

DOUBLE ROMAN AND PAPER WHITE NARCISSUS, 4*s*. per dozen.—The above bulbs, the former of which is so justly esteemed for its early blooming and excessive fragrance, and the latter for its purity and elegance, have been just received at A. CORBETT'S Italian and Foreign Warehouse, 18, Pall-mall, near Waterloo-place.

JOHN AND CHARLES LEE'S Catalogue of STOVE and GREENHOUSE PLANTS is just published, and may be had post free on application, enclosing two postage stamps. Nursery, Hammersmith.

WINTER CUCUMBER—"LORD KEYNON'S FAVOURITE."—Numerous inquiries, within the last few days, for the above CUCUMBER SEED having been made, EDWARD TILEY begs to inform his Customers that he has some good old Seed of this variety, which surpasses all others for winter cultivation. Sold in packets, at 2*s*. 6*d*. each; or sent post free on receipt of 30 penny postage stamps.

EDWARD TILEY, Nurseryman and Seedsman, 14, Abbey Church-yard, Bath, Somersetshire.

CAMELLIAS AND INDIAN AZALEAS WITH FLOWER BUDS.

AUGUSTE VAN GEERT, NURSERYMAN, Ghent, Belgium, begs to offer to the Trade and Public in general, fine CAMELLIAS, with flower buds, at 6*l*. per 100 and upwards, all good and well shaped flowers. INDIAN AZALEAS, well set with bloom, from 5*l*. to 7*l*. per 100 and upwards. His new Catalogue, just published, may be had on aplication to Mr. R. SILBERRAD, 5, Harp-lane, Great Tower-street, London.

NOBLE NEW EVERGREEN OAK, QUERCUS ILEX MACROPHYLLA.

LUCOMBE, PINCE, AND CO. have now some fine strong plants, well established in pots, fit to be planted out immediately, of their

NEW LARGE-LEAVED EVERGREEN OAK.

It is perfectly hardy, and has a sturdy vigorous habit, with remarkably large, thick, glossy, coriaceous evergreen foliage. It was raised from seed in the Exeter Nursery, and the thorough hardiness of the parent plant, now in the specimen ground there, has been fully proved, and is greatly admired by all cultivators of fine hardy evergreen trees. Price 21*s*. each. Discount to the Trade when three are ordered.

L., P., and Co. are also now sending out their fine Seedling Indian Azalea VESTA, for description of which see their Advertisement in the *Gardeners' Chronicle*, Aug. 9, 1851.

Their stock of Coniferæ, Fruit Trees, Forest Trees, Hardy Evergreens, and Deciduous Trees and Shrubs, is this season more than usually fine; amongst all of which are large specimens capable of producing immediate effect, together with smaller plants, at the lowest prices; Priced Catalogues of which may be had on application.

N.B. Strong plants of Kitley's Goliah Strawberry 3*s*. 6*d*. per 100, or 30*s*. per 1000.—Exeter Nursery, Sept. 13.

THE CHAMPION MUSHROOM SPAWN.

MR. S. CHEESE, of Bayswater, London, returns his sincere thanks to Gentlemen and the trade in general, and begs to inform them that he has now ready a large stock of the above superior article, at the usual price, which has stood the test upwards of 50 years, and in no single instance has been known to fail in producing a crop. Any quantity can be had, safely packed, by applying as above. To prevent disappointment apply early.

## NEW PELARGONIUMS.

CHARLES TURNER strongly recommends the following NEW PELARGONIUMS; it will be sufficient to observe that he has the entire stock of those beautiful varieties raised by E. FOSTER, Esq., and G. W. HOYLE, Esq., which obtained 9 extra prizes, and 20 Certificates, during the past season. Strong plants will be ready the first week in October. The usual discount to the Trade. If the Set is taken, a liberal allowance will be made.

ARIADNE (FOSTER).—Rosy purple bottom petals, rich dark top, with narrow margin of rose, clear white centre, free bloomer, large truss, and fine substance; good early exhibition plant; 31*s.* 6*d.*

BEATRICE (HOYLE).—Neat smooth constant flower, bottom petals mottled rose, top petals rich black, even margin of dark carmine, free bloomer; 15*s.*

CELIA (HOYLE).—Beautiful orange lower petals, tinged towards the centre with violet, top petals bright orange, medium spot shaded with scarlet, free and early bloomer, but curly in top petals; 15*s.*

CHIEFTAIN (HOYLE).—Rose crimson, with dark shaded blotch on upper petals, fiery, narrow margin, large, very stout, good habit, rather inconstant; 21*s.*

CHLOE (HOYLE).—Lively bright rose, white centre, medium-sized dark spot shaded with scarlet, good grower and free bloomer; 10*s.* 6*d.*

COLONEL OF THE BUFFS (HOYLE).—Novel bright orange, large and very attractive, constant, and free bloomer; 31*s.* 6*d.*

CRISTINE (HOYLE).—Delicate warm rose, with deep spot on upper petals shaded with orange, large and very free, a fine cheerful flower; 21*s.*

ELISE (HOYLE).—Deep warm orange pink, shaded with delicate lilac, light centre, medium-sized spot, surrounded with orange, margin of orange pink, smooth, constant, and free bloomer; 31*s.* 6*d.*

ENCHANTRESS (FOSTER).—Rosy crimson bottom petals, rich crimson blotch on top petals, with margin of bright crimson, white centre; the shape of Gipsy Bride, but twice the size, free bloomer, and good habit; 31*s.* 6*d.*

EURYDICE (FOSTER).—Deep crimson bottom petals, top petals dark maroon, narrow margin of bright crimson, free bloomer; 15*s.*

GANYMEDE (HOYLE).—Very round, smooth, and cupped, warm lilac colour, white centre, dark top petals, very evenly shaded with purplish carmine margined with the ground colour; 31*s.* 6*d.*

HERALD (HOYLE).—Mottled light pink bottom petals, top dark blotch, with narrow margin, white centre, good shape, and constant, very dwarf, good habit; 7th prize; 21*s.*

ILLUMINATOR (TURNER).—Bright mottled crimson bottom petals, rich dark crimson top, narrow bright margin, very showy and attractive, being nearly as free as the Fancies; 10*s.* 6*d.*

LABLACHE (FOSTER).—Orange rose, with dark blotch on the top petals, large white centre, good substance, very attractive variety; 21*s.*

LAVINIA (FOSTER).—Purple, similar in colour to Alonzo, but of finer form, rich dark top petals, with bright margin, good habit, and fine bloomer; 21*s.*

LITTLE NELL (TURNER).—Rosy lilac bottom petals, maroon top petals, narrow margin of rose, white centre, very free, early bloomer, good plant for exhibition; 10*s.* 6*d.*

LORD MAYOR (BLACK).—Bright crimson scarlet bottom petals, mottled, black blotch on the top petals, shaded off to the margin with scarlet crimson, very showy, and free bloomer; 15*s.*

MAGNET (HOYLE).—A high-coloured scarlet crimson, large black blotch varying towards the margin on a scarlet crimson ground, without being lighter on the edge, very profuse bloomer, and constant, very striking flower; 42*s.*

MOCHANNA (HOYLE).—Lower petals warm rose, white centre, top petals large dark blotch, shaded and mottled with scarlet, margin of ground colour, large fine shape, free, smooth, bold, attractive flower; 21*s.*

MONTEITH (FOSTER).—Bottom petals crimson purple, dark blotch on top petals, shaded off to the margin with crimson; 21*s.*

PLANTAGENET (TURNER).—Crimson bottom petals, dark maroon top petals, narrow margin of bright crimson, free bloomer; 15*s.*

PULCHRA (FOSTER).—Lower petals salmon rose, large rich dark blotch on top petals, with margin of bright rose, white centre; free bloomer, good habit; 21*s.*

PURPLE STANDARD (FOSTER).—Bottom petals rich purple, black top petals, with narrow, even, fiery margin. This flower possesses fine substance, shape, and very smooth; much the best purple; 31*s.* 6*d.*

REMUS (HOYLE).—Deep rose lower petals, with dark blotch on upper petals, shaded with scarlet; smooth, and fine shape; 21*s.*

RUBENS (FOSTER).—Crimson, with dark maroon blotch on top petals, narrow margin of bright crimson; good substance; 21*s.*

SHYLOCK (FOSTER).—Bottom petals deep rich mottled purple, black top petals, a wire margin of scarlet; medium size, free bloomer; the darkest variety raised; 31*s.* 6*d.*

VANDYKE (TURNER).—Bottom petals bright scarlet crimson, dark blotch on top petals, scarlet margin; very striking, but not a good shape; 10*s.* 6*d.*

VONDEL (HOYLE).—Lilac rose, with dark blotch on top petals; 15*s.*

A selection of older varieties at moderate prices. A Descriptive List may be had on application.

Royal Nursery, Slough.

Exeter, September 13.

## GREENHOUSE AND CONSERVATORY BUILDING ESTABLISHMENT, HOT-WATER APPARATUS MANUFACTORY, KENSALL-GREEN, HARROW-ROAD, LONDON.

JOHN TAYLOR begs most respectfully to call the attention of the Nobility, Gentry, and Gardeners, to the very superior manner in which he erects all kinds of Greenhouses, Conservatories, Forcing Pits, &c., and all other buildings for Horticultural purposes, combining all the most modern improvements with elegance and utility. His manner of heating Horticultural Buildings, Churches, Chapels, Public Buildings, Entrance Halls, &c., has received the greatest approbation from the Nobility and Gentry by whom he has been extensively engaged.

WILLIAM E. RENDLE, NURSERYMAN, SEEDSMAN, and FLORIST, by royal permission, to her Most Gracious Majesty the QUEEN, begs respectfully to state that he has this season a very large and well-selected Stock of all the newest and best GERANIUMS, which he is enabled to offer at very reduced prices.—CARRIAGE FREE (see below).

ELLIOTT'S SURPRISE GERANIUM.—This excellent flower was raised by Mr. Elliott, of the Royal Hotel, Plymouth, and was exhibited at the First Exhibition of the South Devon Horticultural Society, held in our Grounds on the 20th of May last. It was much admired, and noticed by the Press in terms of praise. The following is a good description of it:—

*"It is a good round flower, with bright rosy pink under petals, large handsome blotch in the upper petals surrounded by a ray of the brightest rose, terminating with a narrow band of the ground colour, pure white centre with bright pink rays, large and handsome trusser, very free bloomer, and capital habit."*

10*s.* 6*d.*, or 1 over in every 3 to the trade.

RUNDLE'S BEAUTY OF MONTPELIER.—This has proved itself to be one of the best flowers of the day. A large and handsome specimen was exhibited in our Grounds on the 20th of May last, and was universally admired, and plants were purchased by nearly all the Geranium growers who attended the Show.

*"The ground colour is bright pink, with a pure white centre, is an extra sized flower of good shape and substance, short robust habit, and shows its flowers well above the foliage."*

It can be confidently recommended. 5*s.* each.

### FIRST CLASS GERANIUMS.

Purchasers' Selection of 12, from the following List, for 2*l.* 2*s.*, with a PLANT of ELLIOTT'S SURPRISE OVER on every dozen. (See description above.)

RUNDLE'S BEAUTY OF MONTPELIER (description see above); May Queen (Hoyle); Nectar Cup (Hoyle); Ajax (Hoyle); Rubiola (Hoyle); Isis (Hoyle); Flavia (Hoyle); Generalissimo (Hoyle); Gaiety (Foster); Corinne (Hoyle); General Jung Bahadour (Gaines); Lady Peel (Paley's, first time sending out); Candidate; Boule de feu; Village Maid; Cardinal (Hoyle); and Heartsease.

### SECOND CLASS GERANIUMS.

Purchasers' Selection of 12, from the following List, for 12*s.*, or 20 for 20*s.*—Foquette's Magnificent, Topping's Brilliant, Hoyle's Crusader, Arnold's Virgin Queen, Falstaff, Lyne's Forget-me-not, Delicatissima, Rosy Circte, Nourmahal, Desdemona, Hebe's Lip, Centurion, Negress, Cassandra, Sir Robert Sale, Symmetry, Gustavus, Gulielma, Sunrise, Pluto, Duke of Cornwall, Grandiflora, Orion, Black Prince, Mercury, Star of the West, Lady Ebrington, Jenny Lind, Scarlet Defiance, Flora's Flag, and Emilia.

### FANCY GERANIUMS.

Purchasers' Selection of 12, from the following List, for 1*l.*, or 20 for 1*l.* 10*s.*—Perfection, Pilot, Miss Sheppard, Gaiety, Creole, Clown, Jehu, Queen Victoria, Sidonia, Unique, Champion of Devon, Statiiskii, La belle Africaine, Bouquet tout fait, Zelia, Madame Celeste, Nosegay, Beauty of Winchester, Lemon-Scented, Jenny Lind, Radula, Pheasant Foot, Lady Plymouth, Harlequin, Magnifica, Lady Rivers, Alboni, Delight, Dandy, Prince of Orange (a variegated variety).

*If the Selection of Show, Fancy, or Scarlet Geraniums is left to* WILLIAM E. RENDLE, *he will send excellent sorts at 6s., 9s., 12s., or 15s. per dozen, which will insure satisfaction.*

### SCARLET GERANIUMS.

Purchasers' Selection of 12, from the following List, for 15*s.*, or 20 for 20*s.*—Flower of the Day, Excellenco, Glendenning's Perpetual, Magnum Bonum, Queen of Summer, Fire Queen, Royalist, Commander-in-Chief, Resilium, Hendersonii, Monarch, Britannia, and General Tom Thumb

### CINERARIAS.

W. E. R. *has a fine Stock of this beautiful Spring Flower, including all the newest sorts in cultivation.*

Purchasers' Selection of 12, from the following List, for 10*s.*, or 20 for 15*s.*—Coronet, Grand Master, Carlotta Grisi, Bride, Madame Meillez, Othello, Curiosity, Delight, Exquisite, Amena, Angelique, Adela Villiers, Madame Parodi, Attila, Duke of Wellington, Flora M'Ivor, Nymph, Apollo, Angelina, Peri, The Queen, Messenger, Duchess, Ambassador, Speciosa, Desirable, Mrs. F. Millbank, Lady Fellowes, Vernalia, Defiance, Maid of Artois, Maritana, Bijou, Phillis, Newington Beauty, Amanda, Compacta, Election, Cerito, Alboni, and Resplendens.

*Most of these varieties are quite new, and are highly recommended.*

*Purchaser's Selection of* 12 *of the above marked at* 3*s.* 6*d.* *or* 5*s. for* 1*l.*, *or* 12 *of those marked* 1*s.* 6*d. each for* 12*s.*

*All Orders above* 2*l. will be delivered Carriage Free to any Station on the Great Western, Bristol, Exeter, or South Devon Railway, or to Cork, Dublin, or Belfast. First Orders will have the preference. All Orders attended to in strict rotation.*

Apply to WILLIAM E. RENDLE, Union Road, Plymouth, adjoining the Terminus of the South Devon Railway.

COCHIN CHINA OR SHANGHAI CHICKENS, of superior breed and quality, price 10*s.* to 15*s.* each, may be seen and selected by applying to TIMOTHY MASON, No. 5, Bear's-place, New North Road, Islington, London, 2 doors from the North Pole Tavern; or sent, on receipt of instructions, with Post-office Order and 1*s.* for basket, &c. Carrier and Fancy Pigeons for sale. Letters requiring reply to enclose stamp. Japan Pea Fowl wanted.

COCHIN CHINA FOWLS.—A few pure bred Cock Birds, hatched early this spring, are for sale at 12*s.* 6*d.* each, including basket for transmission.—Application as to breed, &c., to be made (prepaid), and the price to be remitted by Post-office Order, on Carlisle, to THOMAS KNOX, Gamekeeper, Barrack Park, Carlisle.

BEAUTIFUL NEW CAMELLIAS.—STORYII.—This beautiful Camellia was raised by W. H. Story, Esq., White Hill, Newton Bushell, Devon. It is a flower of large size, and beautifully imbricated; in form equal to the old Double White; colour, deep bright rose, shading lighter to the centre. It is of unexceptionable habit and foliage, and an abundant bloomer. It is undoubtedly a first-class flower; the Seedling Plant was exhibited at the Horticultural Society's Room, Regent-street, on the 21st of March, 1848, when it had seven expanded blooms, and was awarded the Banksian Medal. Strong plants, 63*s.* each.

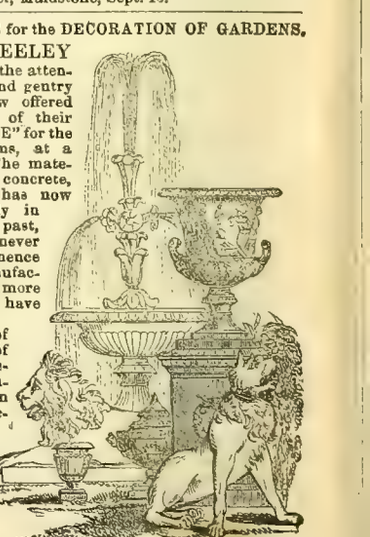
COUNTESS OF ORKNEY.—This truly magnificent variety is figured in the "Florist" for April, 1848, where it is described as follows:—"Mr. Nicholson, gardener to the Earl of Orkney, Taplow Court, is the successful raiser of the beautiful variety figured in our present Number. Our representation may be depended upon for its correctness. The plant is handsome, the foliage large and bold, of a deep rich green. The specimen from which it was copied measured 4 inches in diameter; the flower is circular in outline, composed of large stout petals, perfectly smooth on the edge; these gradually diminish towards the centre, but as they become smaller their forms are less perfect in outline. They are transparent in texture, of a creamy white, and are striped with two shades of bright rosy pink, clear and well defined. We consider it a valuable addition to any collection, and in the class to which it belongs it ranks with the best. Strong plants 63*s.* each.

The usual discount to the Trade.

VEITCH and SON, Exeter, Sept. 13.

## PERMANENT PASTURE.

HENRY ROGER SMITHE, of Eastling, Faversham, Kent, informs the public that his mixtures of the NATURAL GRASSES and small CLOVERS, gathered under his own superintendence, including every sort necessary to form a Permanent Pasture, on various soils, are now ready; delivered on the South-Eastern Railway, at 1*l.* per acre, allowing three bushels per acre. Also Seeds for Lawns, and for renovating old pastures; the nature of the soil to be sown should be particularly stated. Instructions for sowing will be sent with each parcel. Seeds are this year comparatively scarce; the Advertiser has, however, determined not to raise his prices, considering the ruinous effects of free trade on Agriculture, and depending on the extension of his business for a return of his outlay.



## MILDEW.

EPPS'S SULPHURATOR may be had of all Nurserymen, Seedsmen, and Ironmongers, price 21*s.*, and upwards. The Trade supplied by Barber and Groome, Holborn, London.

This Machine has been used by the following persons, and the highest testimonials have been received as to its valuable properties, in effectually destroying the Mildew on Grapes, Peaches, Peas, and all other horticultural produce:—Dr. Plomley, F.R.S.; Mr. Ingram, gardener to her Majesty at Windsor; Mr. Smith, Superintendent at the Royal Gardens, Kew; Mr. Iveson, Sion House; Mr. Glendinning, Chiswick; Mr. Thompson, Horticultural Society's Gardens; Mr. W. P. Ayres, Blackheath; Mr. Gaines, Battersea; Mr. Cole, gardener to — Colyer, Esq., Blackheath; Mr. Robson, gardener to Earl Cornwallis, Linton Park; and many other scientific and practical men.—High-street, Maidstone, Sept. 13.

## ARTIFICIAL STONE for the DECORATION OF GARDENS.

AUSTIN AND SEELEY respectfully call the attention of the nobility and gentry to the facilities now offered by the manufacture of their "ARTIFICIAL STONE" for the Decoration of Gardens, at a moderate expense. The material, which is a lime concrete, perfectly waterproof, has now been tried extensively in Scotland for 20 years past, and the fact that they never had a complaint from thence encourages the Manufacturers to recommend it more actively than they have hitherto done.

The Stock consists of an immense variety of objects suitable for detached Garden Ornaments, or for connection with Architectural Erections—such as Balustradings, Porticoes, &c. The more generally useful portion may be enumerated as follows, viz.:—

193 Vases and Tazzas, from 10*s.* to 30*l.*
70 Statues, from 2 feet high to a colossal size.
15 Baskets, with suitable pedestals.
34 Figures of Animals.
12 — Birds.

A collection of Fountains (perhaps unprecedented) from 5*l.* to 400*l.*
Jardinieres, or large Bowls for Masses of Flowers.
Sun Dial Pillars.
Shells from 4*s* to 12 guineas.
Coats of Arms, and Crests for Gate Piers.
Border Edging.
Garden Seats.
Capitals for Columns.
Flower Boxes made to measurement.

☞ Gentlemen wishing for patterns are requested to state, with respect to Fountains, the power of water they can obtain; and with respect to Vases or Figures, the sizes of the pedestals on which they are meant to stand.

Manufactory, No. 1-4, Keppel Row, New Road, Regent's Park, London.

GREEN AND HOTHOUSE BUILDER.—Green and Hothouses made by Machinery, sent to all parts of the United Kingdom. These Horticultural Buildings are warranted to be made of the best materials, and the cheapest in England. Lists of prices post free. 1½ in. greenhouse lights, 2½*d.*; 1¾ in. ditto, 3*d.*; 2 in. ditto, 3¾*d.* per foot; if glazed with 16 oz. sheet-glass of a large size, 4*d.* per foot extra.

J. LEWIS, Horticultural Works, Stamford-hill, Middlesex.

AYLESBURY DUCKS (WHITE), BLACK BOTANY BAY DUCKS, BLACK NORFOLK TURKEYS, LARGE NORFOLK GEESE, AND COCHIN CHINA FOWLS.—The Advertiser has for sale a limited number of the above in fine strong healthy birds of this year, warranted of the purest breed, which he offers at the following prices: Aylesbury Ducks, of the largest breed known, weighing when fattened 8 lbs. to 10 lbs. each, 8*s.* 6*d.* per couple; Black Botany Bay Ducks, very handsome, and the flesh superior to Teal, 21*s.* per couple; Black Norfolk Turkeys, 21*s.* do.; Norfolk Geese of the largest breed, 12*s.* do.; Cochin China Fowls (pure) from a pair imported direct from Shanghae, and well feathered to the toes, 42*s.* per pair.—Orders accompanied by Post-office orders or reference, addressed to ISAAC BRUNNING, North End, Great Yarmouth, will receive prompt attention.

HOSEA WATERER'S Descriptive Catalogue of AMERICAN PLANTS, CONIFERS, ROSES, &c., for the ensuing Autumn, is just published, and may be had on application, enclosing two postage stamps, to Mr. HOSEA WATERER, Knap Hill Nursery, Woking, Surrey

SAFFRON WALDEN.—SUPERB DOUBLE HOLLYHOCKS.

WILLIAM CHATER begs respectfully to inform the public that his Price Catalogue is now ready, and may be had by enclosing a postage stamp Strong and vigorous Plants are now ready to send out, and the greatest care is observed in packing; also Plants gratis to recompense for long carriage. Early orders will insure obtaining desired sorts, as it frequently happens that some particular varieties are sold out before the end of the season.

W. C. has also a fine collection of Roses, Pansies, Carnations, Chrysanthemums, &c., &c., of which Lists may be had on application.—Saffron Walden, Sept. 13.

DUTCH FLOWER ROOTS.

WILLIAM E. RENDLE, Plymouth, NURSERYMAN and FLORIST by royal permission, to HER MOST GRACIOUS MAJESTY THE QUEEN, has much pleasure in announcing that he has just received a large collection of DUTCH FLOWER ROOTS, in most excellent condition, from one of the first establishments in Holland. The HYACINTHS are particularly large and handsome.—Descriptive Catalogues can be obtained, for two penny stamps, on application to WILLIAM E. RENDLE, Nurseryman, Plymouth.

BASS AND BROWN'S AUTUMN CATALOGUE is now ready, containing—

PART I. The New Geraniums, Fuchsias, Petunias, Verbenas, and other new and select Plants, at reduced prices.

PART II Roses, select Evergreen and Flowering Shrubs, Climbers, Hardy Herbaceous Plants, &c.

PART III. Flower Roots, embracing splendid collections of Ranunculi, Gladioli, Early and Late Tulips, Iris, Lilies, imported Dutch Hyacinths, &c., &c.

Copies supplied on application, published complete with the newspaper stamp, to go free.

Seed and Horticultural Establishment, Sudbury, Suffolk.

FOREST PLANTS IN THE GREAT EXHIBITION.—The Subscribers beg to direct the notice of Planters to their specimens of Forest Plants exhibited in Class IV., No. 1, South-west Gallery, among which are Seedling and Transplanted native Scotch Pines, raised with roots unusually fibrous, adapted for exposed Moorland at a great altitude. The numerous premiums awarded by the Highland and Agricultural Society of Scotland for the cultivation of the true native Scotch Pine, have been awarded to the Subscribers; and their present Stock of this valuable Tree exceeds Ten Millions of Plants. Priced Lists will be furnished on application, and the Trade supplied at the wholesale rate.

JOHN GRIGOR and Co., Nurseries, Forres, Scotland.

GOLIATH STRAWBERRY.—A Post-office order for 5s. will secure (package free) 100 strong plants of this celebrated Strawberry, or 12 plants, free by post, on receipt of 18 postage stamps. Also TROLLOP'S VICTORIA, 4l. per 100, and any of the old varieties at very low prices. The usual allowance to the trade.—JAS. KITLEY, Lyncomb Vale Nursery, Bath.

# The Gardeners' Chronicle.

*SATURDAY, SEPTEMBER* 13, 1851.

MEETINGS FOR THE ENSUING WEEK.

THURSDAY. Sept. 18—National Floricultural ..... ....2 P.M.

COUNTRY SHOWS.—Monday, Sept. 15: Surrey Amateur Dahlia (Camberwell).—Tuesday, Sept. 16: Notting Hill Dahlia, County Meath, Hereford, and Whitby Amateur Horticultural.—Wednesday, Sept. 17: Norwich, Montrose, Bristol, and Taunton Horticultural.—Thursday, Sept. 18: Wycombe Horticultural.—Friday, Sept. 19: Northampton Dahlia, and Darlington Horticultural.

IF the reader would wish to know what is doing in this country, in the importation of new plants, he must visit Exeter. Near that ancient city lies a gentle valley, forming the nursery occupied by Messrs. VEITCH and SON, in which alone will be found more new and valuable plants than in any place in Europe, with the single exception of the Royal Botanic Garden at Kew—plants obtained by private enterprise for commercial purposes, and not gathered together by the power of a mighty Government. By means of excellent collectors (two brothers of the name of LOBB), and liberal disbursements, California, Peru, Chili, Chiloe, Patagonia, in the West; and the Khasija hills, the provinces of Tenasserim, Java, Malacca, and the ghauts of Malabar, in the East, have been gleaned, and the result is gathered into hothouses or transferred to the open air in the fertile soil and happy climate of Devonshire. Let us record a few of the species which caught our eye on a recent visit to this wealthy establishment.

First among the new plants is to be mentioned *Saxe-Gothæa conspicua*, a most beautiful evergreen from the Andes of Patagonia, with the aspect of a Yew tree, which H.R.H. PRINCE ALBERT has permitted to bear one of his names. This tree has lived for four years in the open air, and has all the appearance of being as hardy as an Araucaria. From the same country comes *Fitz-Roya patagonica*, another valuable Conifer, with drooping branches, and also the habit of a Yew; with the *Libocedrus tetragona*, an Arbor-vitæ-like tree, having four-cornered shoots; all, we believe, exclusively in the possession of Messrs. VEITCH.

Among other Evergreens, the existence of which in England is unsuspected, is the great Oblique Beech Tree, from Patagonia (*Fagus obliqua*); *Eucryphia cordata*, with hard, heart-shaped leaves, and flowers like a Tea plant; *Castanea chrysophylla*, the Evergreen Californian Chestnut; great bushes of *Philesia*, just beginning to produce their crimson tubular flowers, 2 inches long, in the midst of hard stiff deep green leaves; *Pernettya ciliaris*, with its black-green broad leaves and heaps of dull purple berries, not to mention the other species *mucronata* and *angustifolia*, loaded with pale berries, gay with ruddy tints; *Laurus aromatica*, a Chilian evergreen, whose leaves are much more fragrant than Sweet Bay; *Embothrium coccineum*, with long tufts of crimson blossoms; *Eugenia apiculata* and *Myrtus Ugni*, Chilian Myrtles, the latter with a fruit like a purple Guava; and, finally, the rare and curious *Desfontainia spinosa*, with the air of a Holly-bush and the flower of a scarlet trumpet Honeysuckle. Of this one single flower had been produced upon a cutting in a pot.

Many are the new or little known evergreen Berberries collected here; *B. Darwinii*, growing into a round, glittering, exquisitely beautiful bush; *B. flexuosa*, a handsome shrub, with straggling branches; *B. lutea*, a pretty diminutive thing; and several other species, at present undetermined. *Eurybia alpina*, from New Zealand, here vindicates its claim to hardiness, along with *Escallonia Pœppigiana*, a Peruvian bush, loaded with white flowers early in the summer, and a great stiff-leaved Dracæna, from New Zealand, which may be *Dr. indivisa*.

Nor are deciduous hardy plants less common here. An Indian palmated *Rubus* is loaded with yellow fruit as large as an Antwerp Raspberry; great masses of a *North wall* are covered with the scarlet perennial *Tropœolum speciosum*, which disregards frost but abhors the sun; the hairy-stemmed *Tropœolum Lobbianun* is curling round a rough stake, and decorating it with its vermilion-coloured flowers; and *Pavia Californica*, the Californian Horse Chestnut, has established itself in the open quarters of the nursery. Quantities of the huge Indian *Lilium giganteum* are hastening to prepare for flowering another year, and heaps of rockwork are glittering with *Oxalis speciosa*.

Among plants of home origin, we ought to point out the *Hedera Ragneriana*, a kind of Ivy with monstrous heart-shaped leaves; *Cotoneasters* and such plants worked half-standard high on the common Thorn; a noble looking Holly called *Ilex alta-clerensis*, which seems to have some of the blood of *balearica* in it; a handsome variety of *Arbutus Andrachne*, called *photiniæfolia*, and most beautiful specimens of that noble *Fuchsia corallina*, whose origin has lately been disputed, but which bears unmistakeable evidence of having been derived in part from *F. radicans* or some allied species.

This sketch of the hardy plants that are already saleable in this establishment, renders an account of the tender plants less interesting for the moment. To them we may return hereafter. For the present it is sufficient to name among the new plants *Lapageria rosea*, a climber from Chiloe, with very large crimson blossoms, a fine new Hoya, with long leathery leaves, some most elegant Indian *Sonerilas* with variegated foliage, a Peruvian Begonia, whose leaves are one confused stain of crimson, purple, green, and silver grey; *Cinchona Condaminea*, one of the true Peruvian bark trees, a plant with a most delicious perfume, now flowering for the first time in Europe; and quantities of Indian Orchids, among which the *D. albosanguineum* stands pre-eminent. As to the Orchids, no plants can exceed their health and beauty, unless it be the choicest of Mr. RUCKER'S collection. In short, turn where you will, the eye meets nothing but what is most fine and rare, in this surprising collection of the Messrs. VEITCH.

MUCH disappointment is felt this season that the crop of WALL-FRUIT has generally failed. Last year we heard the same complaints. Apricots are always an uncertain crop, from the early period at which the blossoms appear; but Peaches and Nectarines, blooming later, do not in general suffer so much. Large portions of the best wall in most gardens are occupied with these trees, which, in a favourable season, bear more fruit than most families require, and in unfavourable seasons lead to the disappointment now complained of.

Let those who wish to know how this evil is to be remedied refer to the third volume of the "Transactions of the Horticultural Society," page 17, and they will there find an account of a Noblesse Peach tree which, in the middle of March, in the year 1811, was covered with glass, but there was no flue to afford artificial heat. On this tree 59 dozen were left to ripen, after 412 dozen had been taken off to thin the crop. After that year the crop was limited to 50 dozen, the Peaches weighing from 8 to 12 ounces each. The only attention required was that of keeping the tree clear of insects.

There is another case in which, by similar treatment, the crop of Peaches and Nectarines never fails. A frame is constructed sloping from the top of the wall to the border, and sashes are put on before the blossoms open, and in this way shelter is given from cutting wind and night frost. By this means abundance of fruit is produced from a few trees, and the walls in other parts of the garden are planted with choice Pears, Plums, and Cherries. Now glass is so cheap, this is well worth attention in this uncertain climate. The sashes, when not required for this purpose, may be made applicable to the shelter of other plants, during the winter, or afford protection from autumnal rains; and the table will be supplied with the finest Pears and other fruit for many months, as well as an abundance of Peaches and Nectarines, instead of being dependent only upon an uncertain crop, which lasts but one month.

The experiment might also be tried with Apricots, and some of the finest Plums. The market gardener might find the advantage of it, as well as those who wish to grow the finest fruit, for the supply of their own table.

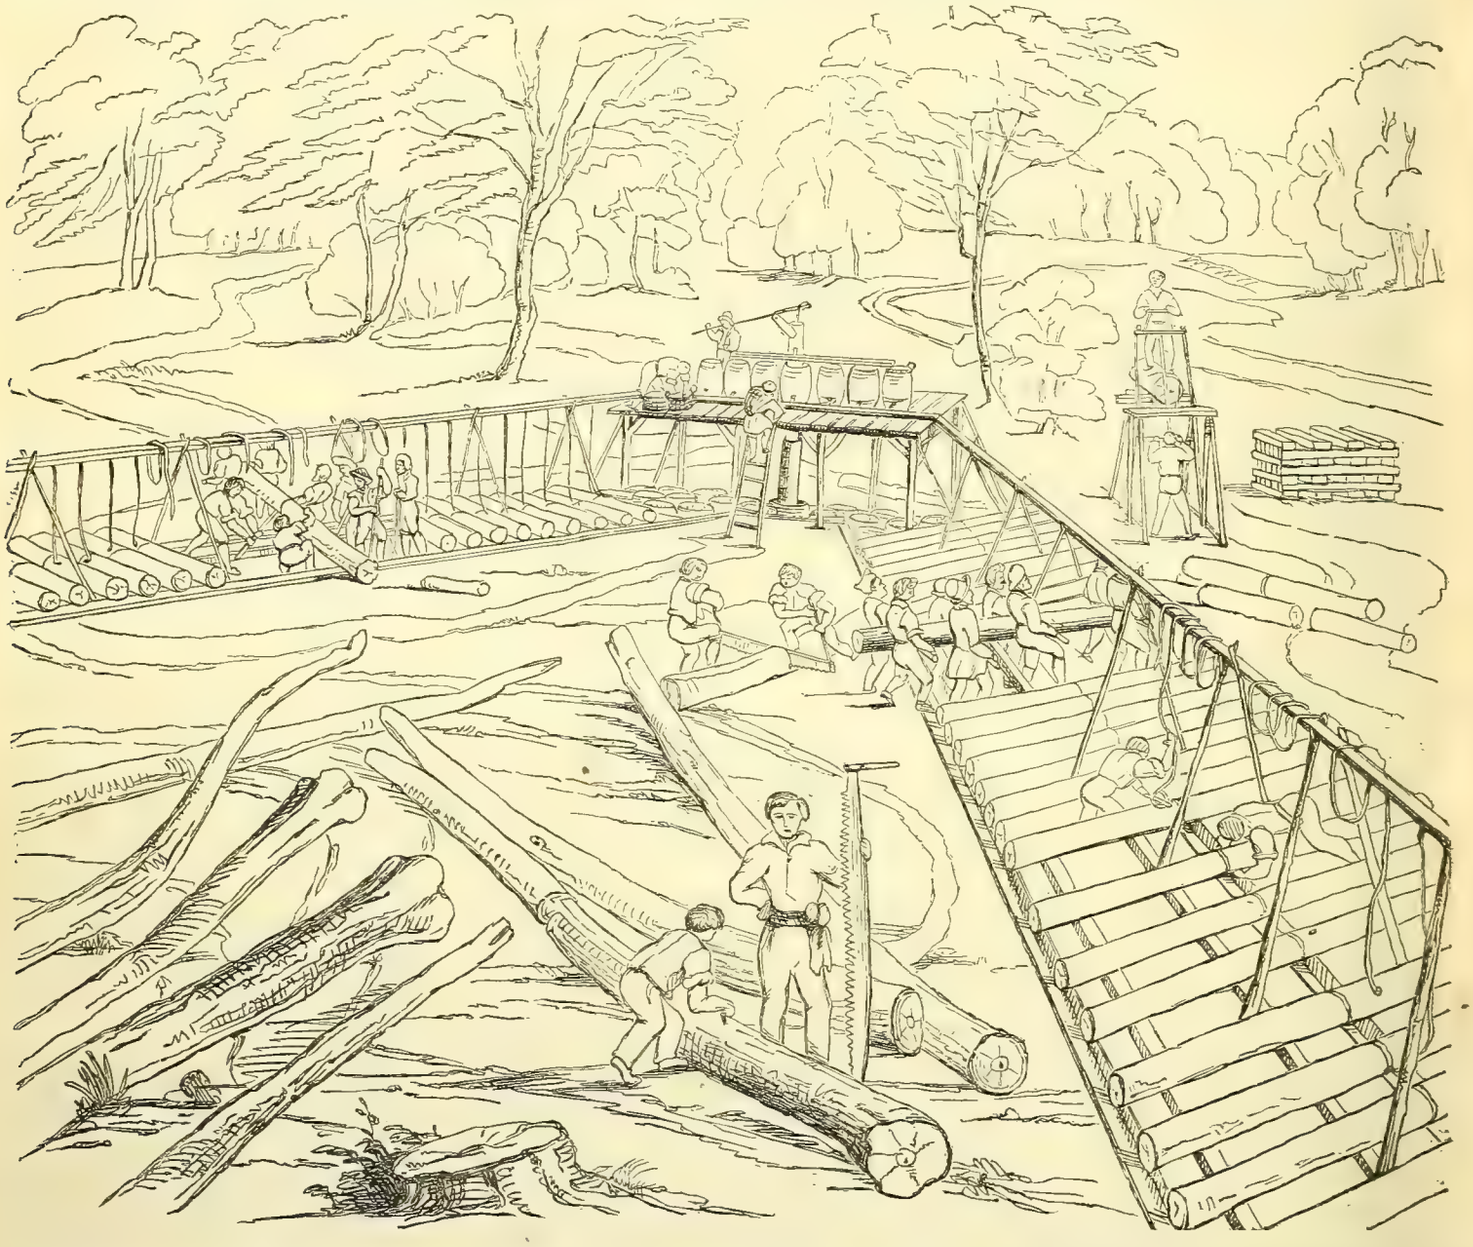
If the manufacturers of greenhouses were to advertise the price at which walls could be covered by this means, it is more than probable they would find many customers anxious to avail themselves of the information here given.

THE powerful effects of PARASITIC FUNGI in disturbing the ordinary growth of various plants is well known. A curious instance was figured in the "Journal of the Horticultural Society of London," in which the various organs of fructification of a Cabbage, under the influence of *Cystopus candidus* were increased to an enormous size, as may be seen from the figure, which is diminished to a third. In that case, however, the relative proportions and arrangement of the various organs remained much the same, the only change consisting in an hypertrophy of all the parts.

In an instance however, now before us, in which the disease is confined to a single blossom of Walcheren Broccoli, not only is the alteration in size even greater than what was observed in the former instance, but many and curious changes have taken place in the number and order of the constituent organs. The peduncle is greatly swollen above, and though no contortion is visible, it is clear that some must have taken place, as the whole flower has made a quarter of a revolution round its axis—the sepals, that is, which in the ordinary state would be lateral, are now anterior and posterior; and in the place of the solitary stamens, which are usually found in their axils, are two new flower stalks strongly curved inwards, with full sized buds. Within the sepals are two series of petals, each consisting of three, that to the right of the now anterior sepal being deficient in the first case, that to the left in the other. In the first series the petals are only partially yellow, in the second the colour is fully developed, but the limb of that to the right of the anterior sepal is rolled into a cylindrical tube. The stamens, including the two transformed ones just mentioned, are double the ordinary number, the six interior stamens, consisting, as usual, of two pairs and two solitary stamens, are seated on the elongated base of the ovary, without any connection, as far as could be traced, with the petals. The remaining two pairs are, on the contrary, more or less connected with the inner row of petals. There is, however, so much confusion about the bases of the petals and stamens as to make it difficult, except in the tubular petal, and in the two dislocated lateral sepals, to say to which particular division of the flower the individual stamen belongs.

Diagram of flower, in which the outer circle *a*, represents the axis of the plant.

It seems indeed probable that the stamens of the first series of petals are wholly suppressed, as also the series of petals to which the internal set of stamens, which are confluent with the base of the ovary, belongs. All the anthers contain perfect pollen. As regards the ovary, the increase in size is less than in the other parts, but the most instructive circumstance is that the dissepiment is wanting except at



the very base, the placentæ being confined to the suture, clearly showing that the dissepiment is nothing more than a development from either placenta meeting in the middle of the pod. Of the two buds into which the usually lateral stamens are developed, the one is deficient in one of the solitary stamens, while the other has only two sepals and two petals, one of the pairs and a solitary stamen being also wanting. There is not the slightest trace of any glands in any part of the flower. *M. J. B.*

---

SEVERAL years since the *Chronicle* drew attention to M. BOUCHERIE's natural methods of charging timber with foreign substances, so as to improve its quality, and to render bad timber valuable. (See our volume for 1841, p. 147.) In this country the processes have attracted little notice; but it appears that in France they have been largely employed. We have now before us a report by some experts appointed by one of the French courts for the purpose of determining whether BOUCHERIE's patent has been invaded by certain parties who have been employing a similar plan of operation. From this report, signed A. CHEVALLIER, J. DECAISNE, and GAULTIER DE CLAUBRY, we gather the following particulars:—

BOUCHERIE's first patent was for "charging the largest timber to its very centre with different preservative, hygrometrical, and colouring ingredients. This power was to be derived by taking advantage of that immense natural force of inhalation by leaves which attends the circulation in plants and causes the rapid conveyance of liquids from the base to the summit of trees." In this way it was stated that the most worthless timber might be rendered durable, brittle timber tough, white timber coloured, and all timber less combustible than usual.

At a later period, viz., July 8, 1840, BOUCHERIE took out another patent, in which, for the inhaling force of vegetation he substituted the displacement and expulsion of sap. For this purpose, he said, it is

only necessary to place the log of timber in a vertical position, to attach carefully to the upper end a waterproof bag, which would act as a reservoir, and to pour into it whatever fluid the operator wishes to inject. As fast as the fluid enters at one end, the sap flows out at the lower, in about equal quantity. The operation is complete when the fluid which runs off at the lower end is nearly the same as it was when poured into the waterproof reservoir. This was a great improvement upon the first plan.

At a later period BOUCHERIE modified his last mode, by placing the timber horizontally, and retaining the waterproof reservoir alone in a vertical position, so as still to gain the pressure required for the expulsion of the sap. And this would seem to have been carried on upon a large scale, judging from a view of the scene of his operations which accompanies the report to which we refer. Unfortunately this view is not accompanied by a detailed description; but from some notes attached to it we learn that it represents a timber-yard in the forest of Compiègne, constructed for the preparation of 60,000 sleepers (*traverses*) of Beech wood, for the Chemin de Fer du Nord. A raised platform is seen loaded with barrels of a solution of sulphate of copper. This platform is connected with gutters running right and left, and supported by struts over a long line of timber placed horizontally, with a saw-cut in the middle of each log, so that they may be operated upon in two directions at a a time. From these gutters flexible pipes descend to the logs, to which they are attached at the saw-cut when the timber is to be charged, and from which they appear to be thrown back over the gutters when the work is complete.

Upon looking at the accompanying copy of the view of the timber-yard, an engineer will have no difficulty in seizing the principle upon which M. BOUCHERIE proceeds, and this may account for the absence of description from the French report. We must, however, add that in the original are excellent representations of details of the process, for which unfortunately we have no room.

---

## ORCHIDS FOR THE MILLION.—No. XV.

By B. S. WILLIAMS, gr. to C. B. WARNER, Esq., Hoddesdon.

CLIMATE HOT AND DAMP. — PLANTS GROWING ON BLOCKS, WITH MOSS.

*Sophronitis grandiflora.*—This beautiful little Brazilian Orchid produces its flowers in February, March, and April; they are orange-red, large for the size of the plant, and they last six weeks in beauty. It succeeds best on a block, with sphagnum, suspended from the roof of the house; it likes plenty of heat and moisture during the growing season, but afterwards it should be kept warm, but not too dry.

*Broughtonia sanguinea*, from Jamaica, flowers from March to July; the flowers are of a dark-red, and remain long in perfection. This plant is best grown on a block, with moss, suspended from the roof, in a moist part of the house; it likes plenty of water during the growing season, but afterwards it may be kept cool and rather dry.

*Brassavola glauca* comes from Mexico; it flowers in February and March; the blossoms are large and white, with red in the centre; they remain two weeks in beauty. It succeeds best fastened to a block, with moss, and suspended from the roof, where it can have plenty of heat and moisture during the growing season.

*Scuticaria Steelii.*—This beautiful Demerara plant flowers at different times of the year. The blossoms are of a dull reddish yellow, blotched with deep purple, and they remain long in perfection. It thrives best on a block with moss, hung up in the hottest part of the house, where there is plenty of moisture; after the growing season is over, it should be kept less moist, but equally warm, as it needs but little repose.

*Renanthera coccinea.*—A charming Chinese Orchid, which flowers in May, June, and July. The blooms, which are orange-scarlet, remain long in beauty. It does best fastened to a large block, with some moss, and it should be suspended from the roof in the hottest part of the house, where there is plenty of light, heat, and moisture during the growing season; afterwards it may be kept dry till it begins to show flower.

*Burlingtonia rigida*, from Brazil; blooms in March and April; the flowers are large and purplish white. It grows best on a block of wood, with sphagnum, and should be hung up from the roof, where there is plenty of heat and moisture during the growing season, but when at rest it may be kept dry.

*Cattleya Aclandiæ.*—This splendid Orchid comes

from Brazil. It has short slender stems; the sepals and petals are brownish green, with deep brown bars across them. The lip is light purple. It grows well on a block of wood, with some moss; it requires a good supply of heat during the growing season, but not much moisture.

*Cattleya Walkeriana*, from Brazil, produces large rosy flowers, at different times of the year. It succeeds well on a block with moss, and requires plenty of heat and moisture during the growing season. The blooms last long in beauty, and are very fragrant.

*Dendrobium heterocarpum* blossoms in December and January. The flowers are pale yellow, very fragrant, and remain four or five weeks in perfection. This plant does best on a block with sphagnum, and it likes a good supply of heat and moisture during the growing season; afterwards it may be kept cool and rather dry.

*Cœlogyne ochracea* is a beautiful Orchid; it flowers in February and March. The blooms are white, and very fragrant, and they will continue in beauty for four weeks. It should be grown on a block where it can have a good supply of heat and moisture while making shoots.

*Oncidium ciliatum* comes from Brazil, and flowers in October and November. The blooms are yellow, and remain long in perfection. It succeeds best on a block, with sphagnum, suspended from the roof, where there is plenty of heat and moisture during the growing season.

*Oncidium concolor*, a yellow flowered kind, from the Organ mountains. Does well on a block with moss, and should have a good supply of water at the roots.

*Epidendrum aloifolium* is a fine species; it flowers in April and May, and succeeds best on a block, with sphagnum. It comes from India.

*Schomburgkia crispa*, from Guiana, flowers at different times of the year, and its blossoms last long in beauty. It will thrive on a block, with sphagnum, suspended from the roof. It likes a good supply of heat and moisture during the growing season.

*Schomburgkia tibicinis*, from Honduras, flowers in May and June. It does well on a block, and requires the same treatment as crispa.

*Schomburgkia undulata* is a Brazilian species, which blooms in February and March, and its blossoms remain three or four weeks in perfection. This will succeed on a block, with sphagnum, hung up from the roof. It likes a good supply of heat and moisture during the growing season, afterwards it may be kept rather dry.

*Cirrhopetalum Thouarsii*, from Mauritius, flowers in October. It requires the same treatment as the last-named plant.

## BRITISH SONG BIRDS.

(Cage Birds, No. 29.)

No. XLV.—This is just the very season for a lover of Nature to revel in delight. Every week, nay, every day brings with it something new—something marvellous to behold; and whilst gazing on the works of Providence as manifested in the Creation, in their daily progress, we are pleasingly constrained to say with the good, the amiable James Hervey—"Even inanimate Nature is all but vocal with the Creator's praise."

The glorious days of harvest are now nearly over. The heavy—thanks be to Providence, the universally heavy—sheaves of corn are carried to the barn, and safely housed; and all is joy and rejoicing with the farmers and their dependants:—

> "There's merry laughter in the field,
> And harmless jest and frolic rout;
> And the last harvest-wain goes by,
> With its rustling load so pleasantly,
> To the glad and clamorous harvest shout."

A right pleasant sight is this; and right welcome are such jocund sounds as they are borne upon the breeze! And see—

> "There are the busy gleaners in the field,—
> The old, whose work is never done,
> And eager, laughing childish bands,
> Rubbing the ears in their little hands,
> And singing 'neath the autumn sun."

And what is better still, our little friends, the birds, are again abroad in their usual haunts; singing, and making melody in their hearts, while these operations of the season are thus cheerfully going on.

'Tis now that the blooming "merrie maidens," and their constant swains, hie forth to the woods and thickets, to gather nuts from off the heavily-laden boughs:—

> "Come, virgins, come! For you their latest song
> The woodlands raise: the clust'ring nuts for you
> The lover finds amid the secret shade;
> And where they burnish on the topmost bough,
> With active vigour crushes down the tree,
> Or shakes them ripe from the resigning husk."

Few pleasures are there greater than this. The remembrance of such sweet pastime carries us back to the "light of other days;"—but we pass on.

Now, too, we observe with sorrow that our summer visitors, the "birds of passage," are beginning to get strangely fidgetty. They seem, one and all, to know that the time for their departure is at hand; and a well-practised eye can see, in their every movement, that very recently they have "resolved themselves into a committee of the whole House; reporting progress, and asking leave to sit again." This final "sitting" will be to decide upon the "great question" of a departure from our shores. An attentive ear can recognise, in the voices of the migratory birds, a note altogether different from any hitherto uttered; nor is it unreasonable to imagine that this "language" of theirs is universally understood by every member of their tribe. This restlessness will continue to increase; and in less than another fortnight, we shall most probably, so far as *they* are concerned, "be left alone in our glory."

To compensate for this great drawback to our pleasures—for we must ever avow our "undying" predilection for the vocal melody of these foreign choristers—many of our native birds come into full song immediately on the departure of the others. Nor is it at all difficult to get through the seasons of autumn and winter, while blessed with the harmony of such sweet voices. The robin, wren, and hedge sparrow are now distinguishing themselves to admiration. The young blackbirds and thrushes, too, are tuning up; and the chaffinch may be heard "pink"-ing merrily in our orchards, and in the fields. As for the tit-mouse—he is chanting *his* merry rigmarole from early morn, throughout the day. The sky-lark, linnet, goldfinch, and many others, are preparing to join the merry throng at no distant period.

We will now discourse of the Babillard (*Curruca garrula*), a little bird of passage, yet with us for a few days longer. Many persons who have not gone closely into the study of natural history, have been in the habit of christening this little chorister, the *Lesser Whitethroat*. It is, however, altogether a distinct species, and takes its name from its garrulous propensities—Babillard being a French word, and its signification a "chatterer."

The babillard is in appearance very like the Peggy whitethroat (Curruca cinerea), which it resembles both in colour and in figure. It is, however, a much smaller and more compactly-formed bird. The bill, too, is shorter; the legs are darker; and from the breast downwards it is of a much whiter plumage. It is also free from the rusty colour on the wings, which is so observable in the whitethroat. Nor does the babillard assimilate much in its habits with the whitethroat. The latter delights in green shady lanes, hedges, and copses, from which it seldom wanders. The former, like the garden warbler, rejoices in our orchards and gardens, where it gives unrestrained license to its appetite. I seldom pass my gooseberry and currant bushes, without finding several of these little visitors "helping the gardener" to clear the branches of their fruit. Some of my neighbours resent these familiarities by the introduction of a loaded gun. Such, therefore, of the poor little innocents as escape assassination from these churls, billet themselves upon *me*; so that I get a double benefit. In the fruit season, my grounds are regarded by our summer visitors as "the refuge for the destitute." I may lose something thereby, it is true, but I gain more.

The babillard arrives among us about the third week in April. He is rather a shy bird in the early part of the season, but he grows more familiar as the trees become covered with foliage. He is a cheerful, merry rogue,—never at rest, but incessantly flying from bush to bush, singing the whole time. His song is hurriedly given, nor can you enter into its merits unless you are close to the performer. It then falls sweetly and melodiously on the ear.

The affection of this bird for its young is very great, and if disturbed, it will very quickly entice its children to quit their nest. Sometimes they disappear long before they are fledged. It is really distressing to listen to the outcries of the parent birds, when they consider their family to be in danger of destruction. Their nest is built not far from the ground. It is slightly constructed, and consists externally of wool and blades of goose grass,—being lined internally with the fibres of roots. It is mostly found in low bushes or young Fir trees. Their eggs vary in number, from four to six. They are of a bluish white colour, with ashy and brown spots at the larger end.

In confinement, the babillard must be treated just like the black-cap, and will speedily become as tame. His food may, for the most part, consist of German paste, hard boiled egg, and sponge cake; but being insectivorous, he must have his usual diet varied with a mealworm, some ants' eggs, a woodlouse, spider, and the like. Boiled milk poured over his sponge cake, and some grocers' currants, soaked, are amongst his choicest luxuries. He is also fond of the bath, which, in summer, he should have administered daily. In winter, it must be altogether dispensed with,—lest the cramp should make its appearance.

The proper cage adapted for this bird is that already recommended for the canary; but it might be an inch larger every way. He must be kept in a warm, snug room, and allowed in winter to catch a glimpse of the fire. He will sing day and night, and come into song in October. He moults freely when kept warm; and during this season he should be treated to Elderberries and Currants.

The babillard is one of those "warblers" whose powers of song can be fully appreciated in a room only. Here he gives "proofs" of his excellence, and he will vie with any song bird of twice his size. With crest erect, you will observe him bid defiance even to a nightingale. He soon ceases to regret the loss of his liberty, when he has a kind master or mistress; and you will find him quite "one of the family" in his expectations. He courts homage; and woe be to you, if you fall short in paying him due respect. He will resent it by "silent" contempt.

In purchasing your birds, select young "branchers," clean moulted, in preference to old birds. The latter are apt to be sulky, wild, and fractious. At this season you will procure them readily; but you must not delay one moment. The sooner they are caged, and domesticated, the better on every account.

I will only add, that if you woo these charming little rogues in the way they *ought* to be wooed, they will soon love you most tenderly. They will take their food from your hand most affectionately, at all times; and lavish on you those numerous unmistakeable endearments in which we all so greatly delight. *William Kidd.*

## BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

Section C. *Tuesday, July 8 (continued from p. 564.)*—*On a Monstrosity of Lathyrus odoratus;* by Dr. Lankester.—This specimen was presented to the section by John King, Esq., of Ipswich, in whose garden it had grown. The Papilionaceous petals were reduced to mere scales, and the calyx assumed a less developed and perfectly regular form. The stamens were no longer diadelphous, but regular, 10 in number, and arranged in two rows. The carpels were reduced to the condition of a single leaf, on which were seated rudimentary ovules. The leaves and branches were not so large, or expanded, as is usual with healthy specimens of this plant.

*Abstract of a Report on the Reproduction of the Higher Cryptogams;* by Arthur Henfrey, F.L.S., &c.—The greater part of the report was taken up by a summary of the facts at present on record respecting the occurrence of the organs termed antheridia and pistillidia in all the higher families of Cryptogamous plants, that is to say, in all those possessing distinct stems and leaves, viz., the Mosses, Liverworts, Ferns, Equisetaceæ, Lycopodiaceæ, Isoëtaceæ and Rhizocarpeæ. The general conclusions at which the reporter had arrived are as follows:—In the facts of which the report gives a brief *resumé*, there are two important points to consider. In the first place, we have to determine how far they suffice to warrant a belief in the existence of a distinction of sexes in these families. In the second place, we have to endeavour to trace the analogies which exist between the different conditions presented by the supposed sexual organs in the different families. These considerations, if we adopt the hypothesis of sexuality, lead to some very interesting questions in reference to the process of reproduction generally. In regard to the first question, that of the existence of two sexes and the necessity of a process of fertilisation, we have several kinds of evidence. 1. The inferences to be deduced from the universality of the existence of two kinds of organs in connection with the reproductive process. In the report it is shown that these exist in all the families at some period or other of the life of the representative of the species. In the Mosses and Hepaticæ they occur on the fully developed plant. In the Ferns and Equisetaceæ they occur upon the cellular structures of frondose character developed from all the spores, which frondose bodies or pro-embryos have an existence of some permanence, especially in the Equisetaceæ. In the Lycopodiaceæ, the Isoëtaceæ, and the Rhizocarpeæ, the pistillidia occur upon very transitory cellular structures produced by one kind of spore, the larger, while the smaller spores at once develope in their interior cellules containing moving spiral filaments, such as occur in the antheridia of the other families.

2. The inferences to be deduced from observations on the development of those spores in which the two kinds of organs occur in distant places, and can be separated. Strong evidence has been brought forward that the dicœcious Mosses, as they are called, do not produce sporangia when the pistillidia are kept apart from the antheridia, by natural accident. The majority of observers state that the larger spores do not germinate, if the small spores are all removed from contact with them; a few counter statements do, however, exist. Again, the majority of authors, and all the recent ones, state, that only the large spores of the Lycopodiaceæ and Isoëtaceæ produce new plants; while some older writers believed that they had seen the small spores germinate.

3. The direct observation of a process of fertilisation, of which we have testimony only from two authors, Suminski and De Merklin, in reference to the Ferns alone, since the assertions of Schleiden in regard to the Rhizocarpeæ have been demonstrated by Nägeli, Hoffmeister, and Mettencies to have been based upon very imperfect observations.

The circumstancial evidence furnished under the first head seems to the reporter very strong, so much so that he is inclined to adopt the idea of sexuality on this ground, as the legitimate provisional hypothesis arising out of our present knowledge, especially when supported so strongly as it is by the negative evidence indicated under the second head. The positive evidence under the third head is certainly very insufficient as yet, considering the extreme delicacy of the investigation. Suminski's other observations on detail points have been contested in many particulars, and De Merklin, the only other observer who asserts that he has seen the spiral filaments within the so-called ovules of the Ferns, describes the conditions differently, and states that he has only been able to observe this positively three times. However, the difficulty of the investigation should make us hesitate in attaching too much weight to the failure of the other observers in tracing a process of fertilisation; moreover it is quite possible that actual entry of the spiral filaments into the canal of the two ovules or pistillidia, is not always, if ever, necessary.

The facts before us, then, appear to the reporter strong enough to warrant the adoption of the views propounded by the latest authors on this subject, and the acceptation of the hypothesis of sexuality in the vascular Cryptogams, as the most satisfactory explanation of the phenomena as yet observed. The question

lies now much in the same condition as that of the sexuality of flowering plants before the contact of the pollen-tubes with the ovules had been satisfactorily demonstrated.

Further arguments may be adduced from grounds independent of the statements furnished in the report, viz., 1. The late discoveries of two forms of organs in the Algæ, Lichens, and Fungi, which, although the inquiry is imperfect at present, lead to the expectation that the analogues of the antheridia and pistillidia of the Mosses so long known, will be found in all Cryptogamous plants. 2. The analogies between the processes of animal and vegetable reproduction, which appear to be offered by these new views of the nature of the phenomena in the vascular Cryptogams. To this last argument the reporter only briefly alludes, as it may be considered to be beyond the special province of the vegetable physiologist, yet when we recollect the imperceptible character of the gradations of the lower forms of the two kingdoms, there seems to be far more solid ground than is admitted by Schleiden, for arguing from apparent analogies between the phenomena presented in the two great kingdoms of nature. Under the second point of view mentioned above, the facts of structure may soon be disposed of, so far as the analogies of form are concerned; the antheridia of the Mosses, Hepaticæ, Ferns, and Equisetaceæ, agree with the small spores of Isoëtes, Selaginella, Pilularia, and Salvinia, in producing cellules in which are developed the moving spiral filaments which constitute the essential character of the organs of the one kind; while the pistillidia of the Mosses and Hepaticæ agree with the so-called "ovules" of the Ferns, Equisetaceæ, Lycopodiaceæ, Isoëtaceæ, Rhizocarpeæ, in general structure, and in the presence of the large central cell, from which the new form of structure originates. The great differences depend on the position, in time and space of the organs, in the different classes, and on the nature of the immediate product of the so-called "embryo-sac," the large central cell of the pistillidia and "ovules." In the Mosses and Hepaticæ, the pistillidia occur upon the plant when the vegetative structure is perfect, and the immediate product of the great cell is a sporangium. If a process of fertilisation take place here, we may regard the antheridia and pistillidia as analogues of the anthers and pistils of flowering plants, the sporangia of their fruits; or, with Hofmeister, we may regard the phenomenon as an instance of an "alternation of generations," when the pistillidia would be looked upon as an "ovule," producing (in the sporangium), a new individual, of totally different character from that developed from the spore (the leafy Moss-plant, in the usual acceptation of the term). In the Ferns and Equisetaceæ, we find the spores producing a frondose structure of definite form, upon which are developed antheridia and pistillidia, or "ovules." Here then we seem to have one generation complete, and the new development from the "ovule" appears as a totally new form, producing stem and leaves, which have a distinct individual form and structure, and produce the spores after a long period upon temporary parts of this structure, on the leaves, and by no means cease to exist, when these are matured. Here we seem to have a real "alternation of generations," and Hofmeister compares the whole permanent plant of the Fern or Equisetum, to the sporangium of a Moss or Liverwort. In all the other families, the Lycopodiaceæ, the Isoëtaceæ, the Rhizocarpeæ, the pro-embryo is a very transitory production, and is developed from a different spore from the spiral filaments. This pro-embryo is clearly analogous to that of the Ferns and Equisetaceæ; and if the existence of sexes be a fact, we have here a dicœcious condition, as contrasted with the monœcious condition in the two families last named. Hofmeister here again assumes that the pro-embryo, developed from the large spore, is an intermediate generation, between the two perfect forms of the plant. It is rather difficult to decide upon the real analogies of these structures with those of the flowering plants. The resemblance is so close between the pistillidia of the Mosses and Hepaticæ and the "ovules" of the other vascular Cryptogams, that they must be regarded as analogues; and then the former could not well be conceived to be analogous to the pistils of flowering plants, but rather to their ovules; if this be the case the sporangium must be considered the analogue of the perfect plant of the Fern, &c., and the leafy stem as the analogue of the pro-embryo of the Fern, &c. The pistillidium of the Mosses could indeed hardly be regarded as analogous to the pistil of a flowering plant, for in that case the spores would be ovules produced long after fertilisation; and on the other hand, if we consider the pistillidium of the Moss as an ovule—which it might be—analogous to that of the Coniferæ, in which a large number of embryonal vesicles or rudiments of embryos are produced after fertilisation, on the branched extremities of the suspensors, then we seem to lose the analogy between the product of the pistillidium of the Moss and that of the ovule of the Fern, unless we consent to regard the entire plant of a perfect Fern as analogous to the ovule of a Conifer. Perhaps the time has hardly come for us to arrive at any conclusion on these plants. The phenomena in the Ferns and Equisetaceæ, as well as in the Rhizocarpeæ, Lycopodiaceæ, and Isoëtaceæ, less strikingly, seem to present a series of conditions analogous to those which have been described under the name of "alternations of generations" in the animal kingdom; and, seeing the resemblance which the pistillidia of the Mosses bear to the "ovules" of the other families, we can hardly help extending the same views to them; in which case we should have the remarkable phenomenon of a compound organism, in which a new individual, forming a second generation, developed after a process of fertilisation, remains attached organically to its parent, from which it differs totally in all anatomical and physiological characters. It is almost needless to advert to the essential difference between such a case and that of the occurrence of flower-buds and leaf-buds upon the same stem in the Phanerogamia, as parts of a single plant, yet possessing a certain amount of independent vitality. These are produced from each other by simple extension, by a process of germination, while the Moss capsule, if the sexual theory be correct, is the result of a true reproductive process. Moreover, we have the analogy to the increase by germination in the innovations by which the leafy stems of the Mosses are multiplied. In conclusion, it is remarked that their anomalous conditions lose their remarkable character to a great extent, if we refuse to accept the evidence of sexuality, which is brought forward in the report. If the structures are all products of mere extension or germination, the analogies which have been supposed to exist between them and the organs of flowering plants all fall to the ground. But, believing that the hypothesis of sexuality is based on solid grounds, the reporter is by no means inclined to allow the difficulty of the explanation of these relations to be urged as valid argument against their existence. He trusts that the present report may be the means of attracting new investigators to a subject which presents so many points of interest and importance.

## Home Correspondence.

*Onions and Celery.*—The following is the plan which I pursue in growing these vegetables:—In the month of September I manure the ground with well-decomposed dung, and dig and plant it with Coleworts for use during winter. As fast as it is cleared, it is ridge trenched, and the manure well incorporated with the soil. In the first week in March (weather permitting), I mark it into beds 4 feet 6 inches wide, with 18 inches for a trench between bed and bed, and the same on the outside of the bed. I then take the soil out of the trench to the depth of 10 inches, and place it equally over the bed. I now rake the surface level, and sow my Onions, casting 1 inch of soil over the seed, treading it and raking it; immediately afterwards, I put 6 inches of rotten manure in the trenches, and dig them, which obviates the necessity of making a second disturbance. I sow my Celery in a cold frame about the middle of February. When up, the plants are thinned out to about 2 inches apart, but they are never pricked out. About the first week in June, they are ready to plant into the trenches. I then cut off the tap roots, but I never cut the leaves. I put two rows in a trench about 6 inches apart, placing the plants triangularly; I plant a row of Cauliflowers 15 inches from the outer trench: these are off before the Celery requires earthing, as I follow the plan recommended in your Paper, of not earthing up my Celery till the end of September, which I find an excellent practice. The Onions are harvested before then, consequently one crop does not interfere with the other, and both arrive at the greatest perfection. *J. Steel, Gardener, Bolton Hall, Clitheroe.*

*The Hop Mildew.*—Having taken an opportunity of carefully examining Dr. Plomley's drawing of the Hop fungus, I cannot concur in the remarks made thereon in your Paper of July 26, p. 467. In the first place, the natural position of the Oidium is not correctly shown, the upright stems being represented, some vertically, others in a descending direction, and all, if I remember rightly, solitary; whereas, their usual habit is to issue in tufts from one to five, or more, nearly at right angles with the matrix, thus. This mistake no doubt originated in the drawing being made by a third party from a *prepared* specimen, as stated, instead of from the living plant. So far from its showing "in the clearest manner the origin of the Erysiphe from the Oidium," by the "swelling out" of one of the joints of the latter, in order to its being converted into the globular peridium of the Erysiphe, this appears to me to be in reality impossible, inasmuch as the joint of the Oidium is four times as large as the young plant of the Erysiphe, and for the greater to swell into the less is against the rules of geometry. The two plants are shown nearly of these relative dimensions by Dr. Plomley, and I cannot for a moment suppose it is intended that a mature joint of the Oidium should become a half-grown Erysiphe, while so many plants in different stages of growth are springing up around it after the order of Nature—some not much larger than the sporidia—others full grown, and bringing forth fruit after their kind. It is true Dr. Plomley's drawing exhibits certain joints of the Oidium of a darker colour than others, and these have been supposed to swell into the Erysiphe, although the supporting threads characteristic of this genus are wanting, and their respective size, shape, structure, and contents differ very materially. It is also admitted by all that some of these joints, at least, contain reproductive spores, and if they do swell into an Erysiphe (which I have not been able to discover) this must in return produce the Oidium. But if we find these dark joints on plants on which the Erysiphe has never been seen—for instance, on the Grape Vine, on which I have frequently seen them bursting and emitting their spores—we must conclude that the two plants are distinct, otherwise the Oidium would have two modes of propagation on some plants and only one on others. Besides, it must be remembered, that the fulcra of the Erysiphe on the Gooseberry, Maple, and Hop differ so remarkably that they are properly considered distinct species. This Oidium therefore, which I am confident is the same on all, must, if the parent of one, be as closely allied to the rest. This would be a very enormous faculty for it to possess; as on the other hand its inability to produce a single Erysiphe on the Grape Vine, and some other plants, would be a most singular restriction. That the Erysiphe should always succeed the Oidium is remarkable, although it is equally common to find three distinct parasites on Rose leaves, namely, Oidium commune, Uredo rosæ, and Aregma mucronatum. This circumstance is, therefore, not of much importance; neither has it ever been attempted to be shown, I believe, before Dr. Plomley's figure, in what way the one plant might be connected with the other; for the Erysiphe and its fulcra are distinctly perfect, without the Oidium, and seldom appear until after the other has passed off, frequently a week or more after the leaf has been gathered. Until some closer tie is discovered, therefore, I must remain of opinion that these two interesting and formidable plants are generically distinct. *Amicus Plato sed magis amica veritas.—F. J. Graham, Cranford, Sept. 8.*

* A joint more highly magnified, containing spores.

*Cuthill's Plan of Wintering Potatoes* (see p. 550).—I have never read Mr. Cuthill's book, but from extracts and remarks upon it which have come under my observation, I apprehend that the principle of his method of wintering Potatoes consists in keeping them dry and cool, and rubbing off the sprouts before they have grown long enough to abstract much of the nutriment contained in the tuber. Now, although Mr. Cuthill's prescription may not have been followed to the letter in the way Potatoes have always been wintered here, yet I maintain that the conditions he insists upon (if I rightly understand them), have been sufficiently observed to warrant my assertion that "there is no connection whatever between the wintering of the sets and the Potato disease;" and, consequently, that a remedy founded upon the assumption that there is such a connection, is "all a mistake." "Chynoweth" also has fallen into a slight error (I trust this expression is not too strong for him), in inferring that because our Potatoes are laid in heaps from one to two feet thick, they must necessarily be injured by fermentation. Nothing of the kind can take place, as they are always dry when stored, never covered with anything to exclude the free access of air, and always sprouted as soon as that process is required; in short, it is scarcely possible for Potatoes to be wintered under more favourable circumstances than they are here, and yet we are equally as subject to the disease as our neighbours. I shall perhaps be told that all this amounts to nothing, inasmuch as Mr. Cuthill's system has not been strictly followed; but will any disinterested person (giving his name and address), come forward and say that by practising Mr. C.'s plan he has preserved his crops from disease? A few authenticated cases of this kind would prove that the mistake is on my part, and not on Mr. Cuthill's. At present, however, I see no reason to change the opinion I have always held—that the cause of the Potato disease is wholly atmospheric. The theory of Mr. Cuthill's remedy, as propounded by "Chynoweth," is, in my opinion, erroneous. By preventing undue exhaustion of the seed tuber, which is all that can be effected by any method of wintering it, we undoubtedly obtain a more vigorous plant; but has it ever been found that luxuriant growth insures freedom from the disease under consideration. On the contrary, I have always observed that the strongest, and consequently the most succulent, vegetation, is the most severely affected when once the poison begins to spread. *J. B. Whiting, the Deepdene.* [We regret to be obliged to observe, with regard to this communication from so respectable a person as Mr. Whiting, that it is unusual to criticise books without reading them, and unfair to condemn any man's practice without having tried it *exactly* as it is described. With regard to the theory of Mr. Cuthill's practice, we must add that it is by no means what Mr. W. supposes it to be. As for atmospheric causes, they are like so-called lunar influences, electrical conditions, and similar expressions—phrases which simply indicate that a *cause is unknown.*]

*Gardening News.*—We learn that Baron Hügel has sold all his plants and houses, &c., to a Russian Prince, who has a fine estate at Florence, where all the plants will be sent. It is considered that the transport alone will cost about 2500*l.* sterling! *A Vienna Correspondent.*

*Cuthill's System of Growing Potatoes.*—Mr. Whiting having offered some remarks on my plan of producing early Potatoes, I shall take this opportunity of endeavouring to make him better acquainted with the subject, for it is evident that he neither understands nor has followed my system, as laid down in my pamphlet on the Potato. I first began to think that Potatoes were badly managed when I lived with the late Mr. Smith, of Deanston. It was customary in those days for poor people in Doune and Deanston to give the neighbouring farmers a small sum of money for a piece of land to grow Potatoes on, the farmer to work the land, and the poor people to find dung and sets. I have often seen in one field 20 or more allotments of this kind, each person using that kind of manure which he thought best, and his own favourite variety of Potato; and even at that time, 30 years ago, I have seen one man's Potatoes come up well, while another's had the curl; some did

not come up at all, and all this in the same field. Now does not this indicate mismanagement of the sets. Weakness and bad treatment of the tubers constituted the cause of failure then, and the same obtains now. The late Mr. Cobbett once informed me that the Potato would be found to be the curse of this country. I considered this assertion too severe as respects our best vegetable, and from that time I paid more attention to it than ever. When at Mistley Hall, in Essex, in 1830, we had a loft, or sort of fruit-room, up a few wooden steps, and here I kept all my early seed Potatoes. Towards Christmas they began to sprout, and it struck me that if we planted them, shoots and all, they would come in earlier. Between 1000 and 2000 small pots were planted, and put into a cold house, where they remained till towards March, when they were planted immediately under a wall (south side), and larger pots were placed over them at night, with a view to protect them from frost. Well, that very year I sent early Potatoes to the Speaker's town house, when they were fetching 3*s.* and 4*s.* a lb. in the market. I also gained a first prize at the Ipswich Exhibition for early Potatoes, being the best and fewest to the pound. Twelve years ago, when I first came here, I made the Potato my principal study, and it has paid me well for my attention. The hagglers (that is the name for those people in Covent-garden, who buy early Potatoes and afterwards sell them at a trifle more to the west-end green-grocers), used to say that Cuthill was come in and the price would soon come down. Even Mr. Fitch (an extensive market-gardener at Fulham) came up to my lads one morning, when they uncovered 200 2-lb. baskets, and said that "Cuthill must have a deal of glass." The only glass covering they had, however, was protecting them during winter upon my plan, which is fully explained in my pamphlet on the Potato, but which is too long to be repeated here. And judging from the numerous testimonials in its favour, from some of the first gardeners in the three kingdoms, I am sure that even Mr. Whiting will lose nothing by reading it, and afterwards strictly following my advice. I have before me, at this moment, a letter from Mr. Milne, then gardener to the late Sir Robert Peel, in which he says that "Sir Robert has read your work on the Potato, and states that it contains a few sensible and concise remarks upon a new method of cultivating early Potatoes, and he has desired me to follow your plan." Mr. Milne adds, "I followed it implicitly, the Potatoes were planted on the 27th of February (1848), and after rising above the ridges six inches they were all cut down by frost about the middle of April; they soon recovered, and were again cut down by the frost. They were longer in recovering this time; but I sent very fine Potatoes to London on the 16th of May, when they were fetching 2*s.* per lb. in the market. Patches not treated upon your plan were in every way later and inferior; the cottagers and labourers hereabouts are so convinced that your practice is perfect, that all intend to adopt it; they propose laying them in cupboards or boxes or lofts, or anywhere, thinly, until planting time." "But," says Mr. Whiting, "what has all this to do with the disease?" I reply, "It has everything to do with it; I do not allow the Potato to sweat, shoot, and waste its substance in premature growths, to be thrown away. All must admit when Potatoes are permitted to grow they empty their cells, not only of the water they contain, but of the other constituent parts necessary to healthy development; and when such sets are planted they produce nothing but succulent shoots, charged with twice as much water as the first shoot; consequently they are less woody and less able to resist the extraordinary vicissitudes of weather which we have experienced during the last six years, and which, in my opinion, have induced the disease." *James Cuthill, Camberwell, London.*

## Societies.

Entomological, *Sept.* 1.—J. O. Westwood, Esq., President, in the Chair. Various donations to the library, and collections from the natural history societies of Munich, Moscow, and Stettin, and from several entomologists, were announced, including a few interesting Coleoptera from Hong Kong, presented by Mr. Bowring, and a series of Hymenoptera, from the Isle of Wight, by Mr. F. Smith. Mr. A. White exhibited a remarkably large specimen of a spider-like Crustacean, Nymphon giganteum of Goodsir (N. Strommii of Kroyer), collected in the ocean near Shetland, at the depth of 20 fathoms, by Mr. Barlee. Mr. White suggested that many of the new forms of Scandinavian Crustacea described by Kroyer would in all probability be found to inhabit the seas of the north of Scotland and adjacent islands. The President announced that a new Part of the Transactions of the Society was ready. Extracts from a letter from Mr. Bowring to Mr. White were read, confirming the accounts of the discovery of a species of moth, parasitic in the larva state, on Fulgora candelaria, the former gentleman having succeeded in rearing another fine specimen, which he had shown alive to Mr. Harrington. Mr. Bowring likewise mentioned the capture of various interesting Coleoptera, in the neighbourhood of Hong Kong. A note was also read from Capt. Hamilton, announcing his intention to send to the Society another collection of Indian insects. Mr. Douglas exhibited various interesting Micro-Lepidoptera, including a new species of Stigmanota, also illustrations of the economy of several species, as well as the nidus of the newly-discovered weevil, Mecinus collaris, within the head of a plant of Plantago maritima. A new species of Gelechia was exhibited by Mr. Grant, as well as various Lepidoptera, from Barnes common. Mr. Smith stated that he had reared Oxystoma Ulicis, from the pods of the common Ulex, as well as a considerable number of parasites belonging to the genus Pteromalus. He also exhibited living specimens of Lamia textor, collected by Mr. Jacques, of Bristol (the President stating that he had received several additional living specimens of Hamaticherus Heros from Sir T. S. Pasley, at Pembroke). Mr. Smith also exhibited a new British Bombus (B. arcticus of Dahlbom), collected by Mr. A. White, at Lerwick, one of the Shetland islands, in the preceding month. He also stated that he had found the cases of the larva of Clythra 4-maculata in ants' nests. A note was also read from Mr. Weaver, confirming the connection between the larvæ of the Cetoniæ and ants, having found the larva of C. ænea in the nests of those insects, and observed that it devoured the ants' eggs. Mr. Douglas also read the translation of a note by Dr. Gensius and Herr Dohrn on the connection existing between the Paussidæ and ants in southern Africa. Mr. Stainton exhibited some Oak leaves, with the burrows of a minute Lepidopterous insect. A note from Mr. R. Spence was communicated by Mr. Spence, on the appearance of the Cicada septendecim in immense swarms in the United States; also a note from Signor Passerini, of Florence, relative to the habits of Denops personatus, one of the Cleridæ. A drawing by the Rev. Mr. Chapman, of a remarkable coloured variety of the Death's-head caterpillar was exhibited by the President, who also communicated a note from Mr. E. Brown on different species of Cecidomyia which attack the Wheat in flower, on a species of Ceratopogon, the females of which hover over water, with a string of eggs an inch and a half long, attached to the extremity of their bodies, and on the flea of the hen-roost. A branch of an exotic species of Fir covered with the eggs of some insect, was forwarded by James Yates, Esq., F.R.S., also communicated by Mr. Spence. The President exhibited the caterpillar, cocoon, and moth of a variety of the silk-moth, the eggs of which were obtained from the province of Cheetiang, in the north of China, by Mr. Parker, during the present season. The silk is extremely white and fine, and is regarded in China as of the best quality, called Tsatlee; the moth is nearly white, and much smaller than the ordinary variety. He also exhibited specimens of Microsetia centifoliella, which he had reared from Rose-leaves mined by the larvæ, and described the transformations of the species.

## FLORICULTURE.

The Horticultural Society's Schedule of Prizes for 1852.—A few comments upon the Schedule of Prizes for 1852, as advertised by the Horticultural Society, August 30, may, perhaps, not be unacceptable to many. I refer to it with satisfaction, because of the liberal and, I hope, welcome movement which has been made, much to the advancement of floricultural pursuits; by results only should we judge, however, but be they what they may, sufficient inducements are held out, I trust, to satisfy the veriest prize hunter for floricultural honours. I am too well known to be challenged with cherishing parsimonious notions; certainly, I am no advocate for the close pruning of by-gone times, a system which has, I trust, worked its own cure. Pelargoniums are again to occupy the tables, and I anticipate their reproduction will be stronger than ever, great preparations are being made to "do battle;" there is already a lively demand for cut-down plants (bottoms), and we may fairly infer that competition will run high in classes 1, 2, and 3, in each of which nurserymen and private growers exhibit independently of the other; the prizes offered in No. 1, are 7*l.*, 4*l.*, and 2*l.* 10*s.*; in No. 2, 4*l.*, 2*l.* 10*s.*, and 1*l.* 15*s.*, the former is for 12 *new* and first-rate varieties, grown in 8-inch pots; the latter for six varieties of larger growth, and which have been actually cultivated in 11-inch pots; so far so good; but allow me to offer a passing remark with regard to the word *new*, as applied in No. 1, for I cannot but think that some better definition here is needed. We all know that *new* is *not* old, but that is not enough, a limit should be fixed so as to determine what new means, for it has seldom happened that the collection which has gained the first prize has not contained something at least as antique as Forget-me-Not. This is, however, no disparagement to the variety in question; but rather the reverse, yet so it has been, and censors get called to account for neglecting, if not misunderstanding, their duty; managers of exhibitions generally cannot be too explicit; much that often proves unpleasant might be easily prevented by a simple foot note, as, for instance, in this case, thus: "By 'new' is meant such varieties as have not been longer in existence than (say) three years from first letting out;" such an explanation no one could misunderstand; our long tried and faithful sorts could not even then charge us with neglect—they are provided for; and such must have been the original intention when the class for 11-inch pots was instituted. In No. 3, fancy Pelargoniums are invited, in collections of six varieties, in (I presume) 8-inch pots, 4*l.*, 2*l.* 10*s.*, and 1*l.* 15*s.* being offered for them. I could have wished a class with 11-inch pots; but for a time, at least, 8-inch pots will prove sufficiently large for the production of well-bloomed and healthy specimens. Proceeding to No. 4, I find that scarlet Pelargoniums are solicited, in collections of six varieties, in 8-inch pots, for July only, and prizes of 2*l.* 10*s.*, 1*l.* 15*s.*, and 1*l.* 5*s.* are offered for them. This I highly commend; it cannot fail to secure due patronage; for, "coming in at Carnation time, a van can as well carry half-a-dozen scarlets as go half empty:" further, if "Tom Thumb improved," be eligible for a place in an exhibition of 18 Miscellaneous Stove and Greenhouse Plants, no objection can surely be raised against a special exhibition of plants of so brilliant a character as scarlet Pelargoniums. *J. E.*

Shacklewell Dahlia Show, *Sept.* 9.—This, the annual exhibition, was far above the average; Dahlias were excellent in character, and abundant. In the Dealers' Class there were six collections, each consisting of 24 blooms, and seven of 12 Fancies; private growers, twenty-one stands of 12 blooms, nine of 6 fancies, ten of 6 new flowers, and five of 4 flowers let out by Mr. Keynes; these with 20 seedlings, of each of which six blooms were required, and some yearlings, made a total of 740 blooms set up for competition. The prizes awarded amounted to 55*l.* Certificates were granted to Dr. Frampton and Sir F. Thesiger (Rawlings); the former has already been noticed; the latter is a lilac of medium size, and of good form; ditto to Triumphant, Laura Lavington, and Nancy (Keynes); to Lizzy (Perry), a flower the exact counterpart of Keynes's Queen of England, but more certain; and to Miss Ward (Turner), a yellow tipped white fancy. Of other novelties, we noticed a seedling scarlet with white tip, named Miss Mathews (Bragg), a valuable addition, and a great improvement in its class, being full, deep, and bright; Wonderful (Keynes), is a flaked flower of fine quality; colours, amber striped with purplish pink; these both received certificates. Among other Seedlings possessing merit, may be mentioned John Davis (Cook), similar to Richard Cobden, Fairy Queen (Turner), Edmund Foster (Turner), Morning Star (Turner), Louisa Glenny (Rawlings); Flora M'Ivor (Keynes), fancy rosy purple and white, fine; Miss Creed (Edwards), pale yellow tipped with white, said to be an improvement on Mrs. Hansard; Globe (Turner). Dealers, 24 blooms: 1st, Mr. Turner, with Mr. Seldon, Duke of Wellington, Princess Louisa, Yellow Standard, Thames Bank Hero, Snowflake, John Edward, Richard Cobden, Queen of Lilacs, Black Prince, Sir C. Napier, Globe (Turner), Fearless, Model, Mrs. Seldon, Shylock, Sir F. Bathurst, Admiral, Andromeda, Summit of Perfection, Nonpareil, Blanchfleur, Essex Triumph, and Elizabeth; 2d, Mr. Keynes, with General Faucher, Negro, John Edward, Queen of Lilacs, Toison d' Or, Snowflake, Richard Cobden, Princess Louisa, Princess Radziville, Mr. Herbert, Mr. Seldon, Seraph, Magnificent, Triumphant (Keynes), Yellow Superb, Duke of Cambridge, and Shylock; Elizabeth, Yellow Standard, Sir F. Bathurst, Douglas Jerrold (Keynes), Duke of Wellington, Fearless, and Sir R. Peel; 3d, Mr. Barnes, whose stand contained, among others, Grenadier, George Glenny, Nil Desperandum, Earl Clarendon, Fame, Uranus, Mr. Palmer, Beauty of Layerthorpe, and Roundhead; 4th, Mr. Legge. 12 Fancies: 1st, Mr. Turner, with Mrs. Willis, Elegantissima, Miss Weyland, Elizabeth, Jeannette, Miss Compton, General Cavaignac, Mrs. Hansard, Forget-me-Not, Duchess of Sutherland, Princess Louisa, and Jenny Lind; 2d, Mr. Keynes, with Empereur de Maroc, Elizabeth, Mrs. Hansard, Lady Grenville, Laura Lavington (Keynes), Miss Compton, Gasperine, Miss Blackmore, Comte de Flandre, Triumphant (Keynes), a sport from a self, Remembrancer, Flora M'Ivor (Keynes); 3, Mr. Legge; 4, Mr. Black; 5, Mr. Barnes. Amateurs, 12 varieties: 1, Mr. Black, with Nil Desperandum, Mrs. Seldon, Thames Bank Hero, John Edward, Duke of Wellington, Sir F. Bathurst, Queen of Lilacs, Richard Cobden, Sir C. Napier, Princess Louisa, Model, and Nonpareil; 2, Mr. J. Edwards, with Nil Desperandum, Mrs. Seldon, Thames Bank Hero, General Faucher, Earl Clarendon, Richard Cobden, Duke of Wellington, Negro, Regina, Fearless, Elizabeth, and Shylock; 3d, Mr. James, with Richard Cobden, Yellow Gem, Duke of Wellington, Sylph, Marchioness of Cornwallis, Admiral, Princess Radzivill, Sir F. Bathurst, Carmina, Hon. Miss Ashley, Gem of the Grove, and Duke of Cambridge; 4th, Mr. Weedon; 5th, Mr. Hunt; 6th, Mr. Cook; 7th, Mr. Allen; 8th, Mr. Holmes; 9th, Mr. Jones; 10th, Mr. Hatchman; 11th, Mr. Prockter; 12th, Mr. Callahan; 13th, Mr. Hopkins; 14th, Mr. Howard. 6 Fancies: 1st, Mr. Black, with Frend Smidt, Mrs. Willis, Mrs. Hansard, Elizabeth, Lady Grenville, and Miss Weyland; 2d, Mr. Allen, with Miss Compton, Forget-me-not, Mrs. Hansard, Elizabeth, Madame Wachy, and Unknown; 3d, Mr. James, with Miss Blackmore, Mrs. Hansard, Miss Compton, Lady Grenville, Elizabeth, and Floral Beauty; 4th, Mr. Bennett; 5th, Mr. Hatchman; 6th, Mr. Edwards. 6 New Varieties: 1st, Mr. Black, with Leda, Queen of Beauties (fine), Carmina, Model, Nepaulese Prince, and Nil Desperandum; 2d, Mr. Holder, with Model, Hon. Mrs. Ashley, Carmina, Mr. Palmer, California, and Sir C. Napier; 3d, Mr. James, with Carmina, Hon. Mrs. Ashley, Nil Desperandum, Admiral, King of Dahlias, and Roundhead; 4th, Mr. Edwards, with Nil Desperandum, Mrs. Hansard, Napoleon, Sir C. Napier, Model, and Regina; 5th, Mr. Weedon; 6th, Mr. Dyson; 7th, Mr. Howard; 8th, Mr. Cook; 9th, Mr. Jones; 10th, Mr. Allen. Extra Prizes offered by Mr. Keynes for four flowers, let out by himself this season: 1st, Mr. Allen, with Mr. Herbert, Nepaulese Prince, Summit of Perfection, and Beauty of Kent; 2d, Mr. James, with the same sorts; 3d, Mr. Black; 4th, Mr. Edwards; 5th, Mr. Pope. Roses were shown by Mr. Francis, to whom a prize was awarded, Messrs. Paul and Son, and Mr. Parsons. Hollyhocks in spikes: 1st, Mr. Parsons; 2d, Mr. Bragg. Cut Blooms: 1st, Mr. Black; 2d, Mr. Dyson. A Certificate was awarded to Hollyhock C. Turner (Black). Liliums were furnished by Mr. G. Bunney; Fuchsias by Mr. James and Mr. Allen. Other subjects, for the purposes of decoration, were largely contributed.

Newbury, *Sep.* 5.—There was a good show on this occasion, and a goodly company. Dahlias: 1st, Mr. Turner; 2d, Mr. Keynes; 3d, Mr. Black; 4th, Mr. Rowden. Private growers: 1st, Mr. Perry; 2d, Mr. Woodley. Six Fancies: 1st, Mr. Perry. Extra prizes for Dahlias let out by Mr. Keynes: 1st, Mr. Black; 2d, Mr. Perry; ditto, let out by Mr. Turner, 1st, Mr. Rowden; 2d, Mr. Black. Certificates for Seedlings were awarded to Laura Lavington and Triumphant (Keynes), to Plantagenet (Turner), a mottled purple, large and full, and to Hollyhock C. Turner (Black), a full-sized crimson, of great brilliancy and of desirable form.

Dahlias: *C E.* It would be a loss of both time and space to give lists of Dahlias now; look to our reports of meetings. We may review the Seedlings at the close of the season. The Hon. Mrs. Ashley (Bragg), is the flower that was rewarded by the Horticultural Society last season. *J E.*

Hollyhock: *C T.* The seedling exhibited by Mr. Black, at the Surrey Gardens, was certainly not named when we made our notes; we also know that the official records were left blank till late in the afternoon. Exhibitors should, at least, attend to their own interests, and then complain if they are neglected by us. *J. E.*

Pansies: *I H B.* These have always been special favourites with us. We are, indeed, thankful for your kind offer, and shall be delighted to receive some at the proper time. We had not forgotten the contract with our Wycombe friend; we hope to meet the case cheerfully, and with every disposition "to do or die." The decision is to be at the Hammersmith Pansy Society, *quality*, not *size*, being the object in view. *J. E.*

Tulips: *J C.* Offsets should be planted by the end of this month; if next, the earlier the better. From an inch and a half to two inches is about the general depth to plant; if the bulbs are strong enough to bloom, they may be placed a trifle deeper; so with the tall growing kinds. Fourth row

flowers require more soil, both above and below, than first row sorts. *J E.*

SEEDLING FLOWERS.

DAHLIAS: *J B L.* Scarcely a second-class flower, the petals being long and of bad substance.*

## Calendar of Operations.

*(For the ensuing week.)*

PLANT DEPARTMENT.

ALTHOUGH cold weather may now be very soon expected, as a natural consequence of the season, we would for the present, even in less favourable localities, only put the more tender of our greenhouse plants under cover, as we dislike crowding the houses as long as it can be avoided; and there are many plants whose constitutions will allow of their being freely exposed for some time longer. As a familiar instance of this, we may mention the Cytisus, Acacia, &c.; and as the flowers of many such plants are valuable through the winter, the continued exposure will retard their season of blooming. In very cold localities, Chrysanthemums in pots should be placed in a cool house, or under the shelter of a wall, where they can be protected by drawing down a canvas in severe weather. Many plants whose wood is properly ripened may at once be removed to a cool light shed facing the north, or placed beneath the stage of the Geranium house; the situation should however be such, that frost can be effectually excluded without entirely depriving the plants of light. These will include Fuchsias, Hydrangeas, Plumbago capensis, Hibiscus, Brugmansia sanguinea, Erythrina, Bouvardia, Hedychium, Canna, Liliums, and a great many others that have done flowering, and only require protection from frost, and a moderate exposure to the light. By removing these, a greater space will be afforded for plants with healthy foliage. Balsams, Cockscombs, and other annuals which have been cultivated for decorating the plant houses during the summer must give place to the winter occupants, as they require the space.

FORCING DEPARTMENT.

VINERIES.—Admit a free circulation of air through these houses, and attend vigorously to the destruction of insects by the ordinary appliances. Keep the atmosphere as cool as possible, where the wood is ripe, or nearly so; and in all cases stop the growth of laterals, even where a warm temperature is of necessity kept up, for the purpose of ripening the crop; as the leaves produced during this month cannot possibly attain a perfect development sufficiently early to repay the amount of stored up sap, which they have consumed in their formation. Where the fruit is not yet fully ripe, a brisk temperature must be maintained, as the keeping properties of the fruit depends on their being matured before the end of this month. PINERIES.—Encourage the growth of successions by abundance of heat and moisture, as long as the strength of daylight and the fine autumn sun will sanction such a course. Let the bottom heat range from 84° to 87°. Continue to shift any that need it, or that are required to furnish the necessary succession, and place them under the most favourable circumstances of top and bottom heat, shade, and moderate moisture, until they have begun to make roots into the new soil.

FLOWER GARDEN AND SHRUBBERIES.

Propagating must be actively proceeded with, in order to get the cuttings struck, while we have the advantage of genial weather; and that they may have the chance of being fairly established before winter sets in, a strong force should be kept at this work until it is completed. If the cuttings are put in early, they have a much better chance of striking, and have a longer time to establish themselves, so that one early struck well-rooted plant will go as far as two or three weakly things at planting out season; and when we consider the numbers of the latter that dwindle away during the winter, the disadvantage of delay is too obvious to need more comment. Young plants of Campanula pyramidalis, Antirrhinum, and others which require a slight protection, should be placed in a suitable situation. All these arrangements should, as far as practicable, be completed at once, so that the hands may be clear when the weather becomes so severe as to render it necessary to take up and pot the old plants required for another season. To this end, pits, frames, boxes, pots, &c., should be prepared, that when the job commences it may be completed as quickly as possible. No time should be lost in commencing any extensive alterations or improvements which it is proposed to carry out this autumn, as the ground is in a much more workable state now than it will be two months hence, and any shrubs shifted immediately will have time to strike fresh root before winter.

FLORISTS' FLOWERS.

Dahlias are now in their glory; and while the present beautiful weather lasts, the amateur may expect abundant recompense for his care and anxiety, still precautious measures must not relax, and the same destroying insects must be caught, and the same attention as to supporting, shading, &c., must be adopted. We see that Mr. Perry, in the "Midland Magazine of Gardening," has found that rags steeped in treacle, and placed in the little pot for entrapping earwigs, is very efficacious, and we are sure that any hint that will more effectually ensure the destruction of these insects will be gladly adopted by our readers. Polyanthus beds must now be made up for the autumn, defaced or indistinct labels must be rewritten, any vacancies should be filled up, and it will be found that the crowns of the plants, with numerous bare fibres, will require covering. With a small hand fork stir the soil between the plants, and top dress the bed with good, well-sweetened, decayed leaves, and cow manure.—Get ready the soil in which Carnation layers are to be wintered, have it under cover, and repeatedly hand pick it. Good rotten turfy loam, with one-fourth Willow dust or vegetable mould, and one-fourth sharp river sand, will form an excellent compost for this purpose.

HARDY FRUIT GARDEN.

Let the young plantations of Strawberries be well attended to by stirring the soil between the plants, and supplying them with plenty of liquid manure, that they may continue to progress at top, and fully employ their leaves in the elaboration of sap. Promote by any and every means their vigorous growth now, and fine fruit will be the reward next year. Alpine Strawberries should be looked to, to see that they are sufficiently moist, as they will soon be found useful in supplying a desirable addition to the dessert. If they are in a state to receive water, supply it in the shape of liquid manure. Plant a few beds of young runners on a north wall for another year; soil a sandy loam, moderately enriched. Look to the buds of fruit trees inserted in July and the early part of August, and loosen the ties. Proceed with forking dung in amongst fruit bushes and Strawberries, and thereby encourage the production of roots near the surface of the ground; these will materially assist in perfecting the growth of the plant, and preparing it for the healthy and abundant development of fruit. Attend to the gathering of fruit as it ripens; and, if any of the trees are without names, take advantage of this opportunity of ascertaining their true names, and marking the fruit as well as the plants.

KITCHEN GARDEN.

If Cardoons will be required for the use of the kitchen before November, a few should now be earthed. It is a common practice to wind haybands round the stems, to keep the soil out of the hearts of the plants; but there are several objections to the practice, and particularly in very cold or wet ground. In such cases the haybands unavoidably absorb moisture from the surrounding soil, and are thereby decomposed, thus forming a harbour for insects, and a natural conductor, by which the frost is admitted, where the object should be to exclude it. In such ground, we would prefer surrounding the stem with a casing of sand or fine coal ashes. In very dry sandy soils the evil does not exist to so great an extent, and to such ground an admixture of sand or ashes would be injurious; but where it is of a stiff clayey nature, it will ameliorate the texture of the soil, besides being more suitable for the preservation of the crop. In any case do not allow the outer leaves to be stripped off, as they are much hardier by reason of their exposure, and form a natural guard to the more tender leaves within. Where soil is used, let it be as dry as possible, and made fine with the spade before it is placed round the plant. Let any plants be taken up, which, in spite of the rich manure given them, are beginning to run into flower; and as they are of no use when blanched, we generally make use of them by planting them in open spaces about the clumps in the pleasure ground, where, if the ground is properly enriched, they form very interesting and striking objects. The spring sown Onions should now be taken up and laid out to dry thoroughly before being strung and hung up for the winter. As the weather of our autumns is so very precarious, they should, if possible, be spread out thinly in an open shed; but if such a place is not at command, the next best is a hard dry gravel walk, from which the rain can pass freely off. Get them under cover by all means, as soon as possible, but do not allow them to be thick together, nor be in too great a hurry to bunch them up. A quantity of Parsley should now be gathered and dried; it answers as well as the green for every purpose except garnishing, and by securing a supply beforehand the demand of green leaves during winter is considerably diminished. Do not neglect to gather in due season Ridge Cucumbers, Nasturtium seeds, Radish and Bean pods, Chillies, and other matters required for pickling and preserving.

State of the Weather near London, for the week ending Sept. 11, 1851, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 17th, 1843—therm. 84 deg.; and the lowest on the 17th, 1840—therm. 29 deg.

## Notices to Correspondents.

APRICOTS: *Philo.* You may force them in tubs (the Dutch do so continually), provided you have skill enough. But your suggestion, that they may be grown in a hothouse or on the back wall of a greenhouse, makes us doubt whether your strength is in the way of forcing.

BIRDS—THE NIGHTINGALE AND BLACK-CAP: *J C Ewan.* The questions you have put to us, as to the *prices* of birds and cages, it is quite beyond *our* province to answer. We have, however, referred your note to Mr. Clifford, and he says his charge is 42s. for the one, and 38s. for the other—all fitted up complete as you desire. Now is the proper time to purchase. In future, please communicate with Mr. C. yourself. *W. K.*—THE THRUSH: *Anna C.* You have been wrongly advised to feed your bird on Fig-dust. In the first place, it poisons the cage, from the sour smell it produces; in the next place, it is unwholesome food. Feed with German paste and crumb of bread, to which add a little bruised Hemp-seed. A snail, a morsel of cheese, and some soft bread and butter, kindly given now and then, will keep your bird in rude health. Of course his cage must be cleansed daily, if you wish him to be "happy." *W. K.*—THE VIRGINIAN NIGHTINGALE: *An Interested Querist.* We are glad that our remarks have given you (as they have done many others), so much pleasure. Mr. Henry Taylor, the gentleman we referred to as having made these interesting experiments, is, as you surmise, the author of the popular treatise called the "Bee-Keepers' Manual." You may therefore implicitly rely on anything that emanates from him connected with such subjects. *W. K.*—THE BLACK-CAP: *Miss P C B.* We have written you by post on the subject of your inquiries; and have, *on this particular occasion*, done as you have requested—selected you a bird. We must, however, notify here, once for all, that we can undertake NO MORE "kind offices" of this sort. Our disposition savours of good nature truly; but *our time* is precious. *Verbum sat. W. K.*—THE BLACKBIRD: *J W E.* The same remarks we have already penned to "Anna C.," about the thrush, will apply with full force to the blackbird. Give him, in addition, every now and then, a morsel of raw beef. *W. K.*—THE LINNET: *Sarah W.* Your bird is moulting. He only requires to be kept warm and quiet, and he will soon resume his sprightliness. Give him a few bruised Hemp-seeds twice a week for the next fortnight. *W. K.*—THE CANARY: *Jane L.* Discontinue the Hemp-seed immediately, and discard the loaf-sugar altogether. *W. K.—E H F.* Do not purchase yet, for a month. We should recommend a Yorkshire bird. That their colour is not good, is true: but they are strong, vigorous, and excellent song birds. You may safely deal where I have recommended. Canary, Flax, and Rape seed, are the proper food. *W. K.*—THE GOLDFINCH: *Angelina.* It is a young bird, called a "grey-pate." When it has moulted, its showy colours will be fully developed. Hang him low, to make him tame. We described his proper food in our last week's paper. *W. K.*

BOOKS: *Charles L.* We cannot enter into private correspondence. For Geology, obtain De la Bêche's new work on the subject; for Entomology, "Kollar, on the Insects injurious to Agriculture, &c.;" for Chemistry, "Solly's Rural Chemistry."—*G M G.* Whiting's "Flower Gardening for Ladies," a shilling book.‡

DEGENERACY IN PLANTS: *Working Gardener.* We cannot print the schoolmaster's trash. He ought to know better than to talk such stuff.

DRY ROT: *B G.* This is very much aggravated, if not caused, by want of currents of air beneath a building. It is caused by species of Polyporus, Dædalea, Merulius, &c. Botrytis has nothing to do with it. Corrosive sublimate prevents it and destroys it.

FRUITS: *J N.* You must not exhibit two sorts of Grapes; but the fruit must be wholly different, to satisfy the terms of the schedule. Grapes, Melons, Peaches, Nectarines, Apricots, Plums, Cherries, Figs, Apples, Pears, Raspberries, Strawberries, &c., are distinct kinds, and you may show one dish of eight of them.

GREENHOUSES: *C A L M.* As far we can understand the plan, it is needlessly costly. A double hipped roof is much more expensive and less convenient than a span roof with upright ends, and it has no sort of counterbalancing advantage. Otherwise we see nothing objectionable. The stage is like all stages, ugly, and not more commodious than two or three broad terraces of stone work.

INSECTS: *J P.* The fly captured on a Laurel leaf is the common Chrysis ignita, which deposits its eggs in the nests formed by other hymenopterous insects in old walls, posts, &c. *W.—Bridgewater.* It is quite impossible to offer you any advice without seeing a specimen of the insect, "somewhat resembling an ant," which attacks your Parsnips, Carrots, and Cabbages. *W.—W H W.* The irregular, comb-like material, found in the stump of an old tree, appears to be a portion of the nest of the tree ant, Formica pubescens. *W.—E P.* The small weevils which have devoured the grains of Wheat from the Cape of Good Hope, are the Calandra oryzæ. The little moths reared from the small green caterpillars, which feed upon the berries of unripe Muscat Grapes, are so much rubbed as not to be made out with precision. They are a species of Tortrix, most probably the Cochylis Omphaciella of Audouin's memoir on the insects which attack the Vine. *W.—S and N.* Thanks for the winged specimens, which prove the insect to be a new Chinese species of Tingis, which we will shortly take the opportunity of describing and figuring. *W.—C M.* The mining larva of the Laburnum leaves is most probably a Lithocolletes. We believe, however, that no account of its transformation has been hitherto recorded. *W.—C M.* The white woolly matter on the stem of the Beech is secreted by the females of a small species of Coccus hitherto, we believe, undescribed. The eggs are now hatching, so the tree should be cleansed at once. Can you send us a small portion of the bark with the insects *in situ*. *W.*

NAMES OF FRUITS: *J E.* Your Plum is Cooper's Large Red.‖—*Besborough.* Not known.‖

NAMES OF PLANTS: *Ignoramus.* Bromus secalinus.—*Botanicus.* Calceolaria perfoliata.—*M K.* Two Lichens; the large one is Cladonia uncialis; the smaller, Cladonia furcata. We do not undertake to name Cryptogamic plants.—*D R H.* A, Polystichum aculeatum; B, Lastrea Filix-mas; C, Asplenium Ruta-muraria; D, A. trichomanes; E, Cystopteris fragilis; F, Cornus suecica. *S.—W G.* Escallonia rubra.—A few inquiries stand over for further consideration.

OAKS: *C P, T T.* A leaf-bud has been stopped in its growth, probably by some insect, and its scales have enlarged in consequence, and multiplied, till at last you have a cone. The Vegetable Marrow is attacked by the white mildew, that is so common everywhere in the autumn.

PEACH TREES: *A B.* Your trees have all the appearance of growing in a cold wet subsoil. In all probability the roots are out of the prepared soil. In such cases it is a good plan to concrete the border.

POTATOES: *J Stollard.* There is no security against this disease. Buy Mr. Cuthill's pamphlet, and follow his directions exactly, and you will have as much protection as can be procured. It does not matter where you get your seed from, it will be diseased all the same, if circumstances are favourable. Plant your rotten Potatoes next February as seed, by way of experiment. Ten to one you will have a good crop.

STRAWBERRIES: *Clapham.* If the natural soil of your garden is too light for Strawberries, you must add loam to it. You cannot do better than make the bed for your British Queens half good fresh loam and half garden soil. We presume you will then be successful.‡

MISC.: *A B.* Both the plants you mention are Palms.‡

GLASS FOR PIT FRAMES, HOTHOUSES, &c., in Boxes of 100 feet, 8s. 6d. each.

| | | | | | |
|---|---|---|---|---|---|
| 4½ by 3 | ... | 5 by 2½ | ... | 6 by 2½ | ... 6 by 3½ inches. |
| 4½ by 3 | ... | 5 by 3 | ... | 6 by 3 | ... 6½ by 3 |
| 4½ by 3½ | ... | 5½ by 3 | ... | 6½ by 3 | ... 6½ by 3½ |

Larger Squares increase in price according to size. Every size kept ready packed in boxes, and may be had at a moment's notice.

Extra Crown, Sheet, and Patent Rough Plate Glass, cut to size for Conservatories, Greenhouses, &c.

Gardeners and others glazing on Mr. Paxton's plan can be supplied with Sash-bars of any length for the purpose.

PROPAGATING, CUCUMBER, FERN, PEACH, and every description of Garden Glasses.

Bailiffs, Farmers, Dairymen, and others supplied with Lord Camoy's Milk Syphons, Milk Lactometers, Glass Milk Pans, Glass Tiles, Slates, &c., &c., for collections of which Messrs. COGAN and Co. were honoured with the Silver Medal of the Dublin Society, as also the Silver Medal of the Liverpool and Manchester Society held at Warrington in September last.

For Estimates, Prices, and further particulars, please address Messrs. COGAN and Co., 48, Leicester-square, London.

Glass Shades, Gas Glasses, White Lead, Colours, &c., as usual.

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS, AS THE ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

THE LONDON MANURE COMPANY beg to offer, as under, CORN MANURE, most valuable for spring dressing—Concentrated Urate, Superphosphate of Lime, Nitrate of Soda, Sulphate of Ammonia, Fishery and Agricultural Salts, Gypsum, Fossil Bones, Sulphuric Acid, and every other Artificial Manure; also a constant supply of English and Foreign Linseed-cake. Peruvian Guano, guaranteed the genuine importation of Messrs. A. Gibbs and Sons, 9l. 10s. per ton, or 9l. 5s. in quantities of 5 tons and upwards.

EDWARD PURSER, Secretary.

40, Bridge-street, Blackfriars, London.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Clover Manure, per ton ... ... ... | £11 | 0 | 0 |
| Turnip Manure, do. ... ... ... ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per ton, in dock. Sulphate of Ammonia, &c.

ARTIFICIAL MANURES.—Private instructions in Chemical Analysis and the most approved methods of making Artificial Manures are given by J. C. NESBIT, F.C.S., F.G.S., at the Laboratories, Scientific School, 38, Kennington-lane, London.

Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY.

HENRY KER SEYMER, Esq., M.P., Chairman.

JOHN VILLIERS SHELLEY, Esq., Deputy Chairman.

Empowered by Act of Parliament to execute all works of Drainage (including outfalls through adjoining estates), to erect Farm Buildings, and carry out every kind of permanent improvement upon estates under settlement; to provide the money or to enable the landowner to employ his own capital, and execute the works by his agents; and to secure repayment of the outlay by a charge on the property improved, spread over a number of years.

Applications to be addressed to

WILLIAM CLIFFORD, Secretary.

Offices, 52, Parliament-street, London.

HOSE FOR LIQUID MANURE, Fire-engines, and agricultural purposes, made of canvass, lined and coated with gutta percha; it is about one-third the price of leather or india-rubber, will convey liquids of all kinds under a heavy pressure; it is extensively used at the Government public works, also by the navy, and amongst agriculturists, giving universal satisfaction. Testimonials and prices may be obtained of Messrs. Burgess and Key, 103, Newgate-street, sole manufacturers.—London Agents: Messrs. Deane, Dray, and Deane, Swan-lane; Messrs. Tilley, Blackfriars-road.—Country Agents: Messrs. Ransome and Parsons, Ipswich; Messrs. J. and S. Johnson, Liverpool; Messrs. Dickson, Hull; Mr. S. Wilson, Agent for Scotland.

ANTHONY'S PATENT AMERICAN CHURN has obtained a Prize at every Agricultural meeting at which it has been exhibited; and the Proprietors have sold upwards of 2000 in one year, and received from all parts of England the highest testimonials in its favour, both as to the short time required, the quantity and quality of the Butter made, a copy of which testimonials, with prices, will be forwarded on application to BURGESS and KEY, 103, Newgate-street, Sole Agents to the Proprietor.

FOR WATERING GARDENS, DISTRIBUTING LIQUID MANURE, BREWERS' USE, &c.

PATENT VULCANISED INDIA-RUBBER HOSE-PIPES AND FLEXIBLE GAS TUBING.

JAMES LYNE HANCOCK (sole Licensee and) Manufacturer, Goswell Road, London.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, for portable Gas Lamps, and all purposes where a perfectly sound Waterproof and Flexible Pipe is required. Hot Liquors or Acids do not injure them; they are, therefore, much used for Chemical purposes, as they require no oil or dressing when out of use; are particularly suitable for Fire Engines, and are found exceedingly useful in Dwelling-houses for conveying Hot or Cold Water to Baths, &c.

Testimonials and prices may be had on application to the Manufactory.

N.B.—Vulcanised India Rubber Garden Hose, fitted up with Roses, Jets, and Branches complete, with union joints ready to attach to pumps or water cisterns.

All Letters or Orders addressed to J. L. HANCOCK, Goswell Mews, Goswell Road, London, will meet with immediate attention.

Waterproof Fishing Boots and Stockings, Portable India-Rubber Boats, Shower and Sponging Baths, Air Cushions and Beds, made all sizes to order.

POTTER'S GUANO.—AUTUMN SEASON.—There can be no doubt, in order to obtain the most beneficial results from manures, whose effects depend on their gradual decompo ition in the soil, that applying them at this season is far preferable to the spring.

Mr. POTTER begs to signify that any orders he is now favoured wi h shall be treated as if given in the spring, and the term of credit reckoned from thence. Price of POTTER'S Guano, 7l. per ton. POTTER'S Superphosphate of Lime, 6l. per ton, bags included and delivery to rail.

N.B. Mr. POTTER is prepared to prove that, in many instances, his Guano has afforded equal, and even superior results to the Peruvian, at 25 per cent less cost.

DURABLE OUT-DOOR PAINT.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the Nobility, Gentry, and Clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Wood, Iron, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice. Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON and SON, No. 9, Great Winchester-street, Old Broad-street, Royal Exchange, London. No Agents.—All orders are particularly requested to be sent direct.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description; but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected on the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

**The Agricultural Gazette.**

*SATURDAY, SEPTEMBER* 13, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

THURSDAY, Sept. 18—Agricultural Imp. Soc. of Ire and.
THURSDAY, — 25—Agricultural Imp. Soc. of Ireland.

THE construction of M'CORMICK'S REAPING MACHINE, which now deservedly excites so much interest and attention, is exceedingly simple; and though not perfect in its adaptation to all the purposes to which it bids fair soon to be applied, it involves a principle which (when investigated, studied, and applied to the requirements of the various circumstances of ridged land and low cutting, and when supplied with a few very easy and desirable modifications and additions) promises to prove a greater acquisition to the farmer than any which has been introduced for a considerable time. Even in its present form it is able and likely ultimately to supersede the application of the scythe, the sickle, and the hook. Nor need the labourer regret his chances of toil and money which appear thus to be abstracted by the introduction of machinery. This is the old cry, and here it is even more unfounded than ever. Railways do not rob coachmen of bread nor horses of Oats, but both are now saved severe journeys and considerable peril. Steamboats require sailors, and the greater number of cargoes afford employment to more men on shore and in safe ports. Farmers, too, will still require their *hands;* but in this case, as in all others, we must overcome the *vis inertiæ*—the disinclination to change—which is inherent in the human mind. We must shape our course to suit the altered circumstances.

Machinery, such as this, will have the usual effect of similar introductions and improvements. Railways increase travelling, steamboats extend seafaring and traffic to the multitude, and steam factories enlarge the production and consumption in their respective lines; so likewise farming machinery, more especially such as tends to expedite harvesting operations, will improve the agricultural produce and resources of the country, by enabling the farmer to employ more labour in saving his grain thus expeditiously and cheaply cut down, and in attending to other crops which universally suffer in harvest from the abstraction of their just share of the labour then necessary. Thus the labourer will be a positive gainer; produce will be increased, and therefore cheapened; while his toils will be alleviated.

The following details of the mechanism of the instrument will enable any one to form as good a notion of its mode of action as can be obtained without actual inspection or by the aid of elaborate and detailed diagrams.

The machine at present is suited to the draught of two horses, attached to a pole as in an ordinary carriage, but there is no reason why single-horse machines should not be made. The horses travel close by the right side of the grain to be cut, and a metal wheel, 2 feet in diameter, receives the end of the pole, carries the machine, and by its motion forward sets the whole instrument in action, conveying regular and equivalent effect to each part of it, proportioned to its own velocity. Every one can conceive how, by a few small and simply adapted cog-wheels and a strap, this mutual operation is obtained and continued; how it may be conveyed from one part of the implement to the other; and how, by a single crank, the circular motion is converted into a longitudinal one, and made to move the cutters across the grain, backwards and forwards, acting as they do in either direction, and thus having only a certain quantity to shear each time as their velocity increases with that of the forward progress. These arrangements and adaptations are common to all machinery, and therefore require no farther comment. We shall merely advert to Mr. M'CORMICK'S ingenious device for cutting the grain, which seems to be tolerably perfect in itself. It is the position and arrangement of it, with the treatment of the grain when cut, which appear to admit of some improvement.

The cutting tool is placed at right angles to the direction in which the horses move. It is 6 feet long, supported at one end by the wheel already alluded to as communicating motion to it, in common with the rest of the machinery, and at the other by a small block wheel, 1 foot in diameter. It is put so as to cut 5 inches from the ground, but by increasing the sizes of the wheels, especially that of the smaller one, which would have an additional advantage in facilitating the draught, and by introducing bent axles admitting of adjustment, it might be suited to cut at any height, and also be adapted to the circumstances of uneven ground or lodged grain.

The edge of the cutting tool is formed like an ordinary sickle, with serrated teeth cut deep on one side of it, so that when broken or worn down they may be brought out again by filing or grinding the other side. It consists, also, of a number of distinct pieces, so that in case of accident or injury to one, it may be replaced. It is fortified by 15 spear-pointed *fingers*, which protect the knife, and a the same time raise and support the grain to the edge, which is waved and has the teeth set in different directions, so as to cut both ways, as it moves 5 inches each way. It thus meets the grain at an angle to the direction of its motion, and shears every thing presented to it, without missing a single straw, unless it is below its reach. Nothing could surpass the beauty and regularity with which some standing corn was deposited by it at its late trial at the Royal Agricultural College at Cirencester.

Some attempts have been made, and may succeed, in bringing even lodged and tossed grain within its scope. Exigencies of this kind, which are, however, exceptional cases, will no doubt be met by some contrivance. All these improvements, however, involve much practical difficulty and complication in detail, which can only be obviated by experience.

The principle is sound, the application a decidedly successful step towards the grand desideratum which many others have failed in attempting to supply; the present praiseworthy effort seems completely successful.

Taking the ordinary speed of a horse (say 2½ miles per hour), and recollecting that the machine, being 6 feet broad, will cut a swathe 5 feet wide, it appears that it will cut more than 15 acres in a day of 10 hours. It requires a man to take away the corn, and a boy to drive the horses. Farmers may therefore judge for themselves of its advantages. We only beg leave to assure them that what we saw cut by it was as neatly and regularly shorn and deposited as it could be done by the ordinary methods. *O.*

## ALTERNATE CULTURE.

W. GRIFFIN, of Eydon, suggests to those who may object to the waste of space in the uncropped alleys, and would like to grow a green crop thereon during the summer months, to fork in manure and plant Early York Cabbages, after the last forking in of the alleys. Mr. Griffin is aware that this would be a departure from Mr. Smith's principle, which is the sufficiency of atmospheric inflow with a thorough comminution of the soil to infuse a fertility sufficient for the production of remunerative crops of grain without manure. To work out this principle the green crop should be sown or planted without manure. And why should it not?

Green crops are introduced in our courses between grain crops, as ameliorative to the soil, being less scourging, from deriving, through the breadth of their leaves, the larger portion of their nutriment from the air; if this is fact, under the treatment to which Mr. Smith subjects his ground, the green crops ought also to be remunerative without manure; if not, all the principles on which the Tullian system, as well as the alternate one rest, are delusive, and our greatest agricultural chemist is in error. The fact that the soil will produce green crops under ordinary tillage without manure, has been often proved by experiments made to ascertain the relative fertility induced by the application

of various manures, in which a section of the experiment ground has been left unmanured. The only questions are whether, under Mr. Smith's treatment, proportionable remunerative results in the green crops may not be obtained. This inquiry may, perhaps, be worth the rev. gentleman's attention; and whether, in every case, the application of manure may not produce such an increase of fertility as will more than repay the cost? In my opinion it will; and so far as I could afford it, I would manure. The obtaining a succession of crops without manure by a wide row tillage, I consider only admissible where from any cause manure cannot be applied; and the great object I have in view, and I doubt not this is Mr. Smith's, is to show that remunerative crops may be so obtained; and if so, that the same treatment will proportionably increase the produce where manure is applied.

If Mr. Griffin expects merely to obtain a stolen autumnal crop, after the removal of a preceding crop of grain, by planting Cabbage as he recommends, he will, no doubt, succeed, though not to the weight he calculates on. In field tillage, I have rarely found an Early York, or Nonpareil, weigh 4 lbs. under every advantage of spring and free culture. They will, I think, only root before the harvesting of the grain; and if they do more, they will be drawn up, and much deteriorated; for if the Wheat grown on Mr. Smith's plan is at all luxuriant, it will quite overshadow the 3 feet alleys. I had proof of this in an attempt to produce a row of Lettuce between two rows of Barley at 3½ feet distance. In my interlining crops, I have, consequently, adopted 4 feet between my grain rows. But in Mr. Griffin's allusions to a green crop during the summer months, and to his crops of Cabbage between rows of Beans, he appears to contemplate a crop of Cabbage simultaneously ripening with a grain crop—not that I believe he proposes to recommend it; in this case I should think he will be certainly disappointed. He seems to apprehend a possibility of the Cabbage injuring the Wheat of the present or after crop; of this he need entertain no fear, it is the taller growth of the Wheat that will injure the Cabbage, and thwart his plan. As innovation ever meets with the most ungenerous opposition, it was remarked, somewhat ungraciously, that Mr. Goodiff would spoil his Wheat by his Cabbage, and his Cabbage by his Wheat; it is now evident to all that neither has received injury from proximity to the other.

On Mr. Smith's plan I would remark, that I feel very sure he would not reap a grain less if he sowed only two rows in his distance of 2 feet. If his Wheat is as luxuriant as I suppose it to be in such deeply tilled land, that is about 6 feet high, I think the centre rows will be so much injured as to be of little value, while they will deprive the outer rows of a portion of their nourishment—I mean rather atmospheric privation than earthy; this is agreeable to our present science and accords with a practical instance which I think it here pertinent to mention. Some years ago I sowed, with a view to ascertain the most desirable quantity of seed to sow, several rows of Barley, at 21 inches apart, one row was omitted, which left two of the rows 3½ feet apart; now, each of these two rows, seeded with the same quantity of seed, yielded more than double the produce of any other of the rows, had a foot more length of straw, and were standing while the others were much lodged. I would beg leave to suggest to Mr. Smith, to compare the produce of his centre rows with his outside ones, and to try the effect, if not too far advanced to produce any, of removing the centre row now, and of omitting it in a part of his next crop.

I have now, in the very ill-conditioned land I have recently taken, near an acre and a half of Wheat, sown at intervals of 4 feet, which my neighbours calculate will yield from 24 to 28 bushels to the acre: I have put it down myself at 20, but whatever it may be I am quite sure, from its present gappy appearance, of a yield next year of more than double, and which I expect, as the land improves, to raise much higher. These 4 feet intervals allow me full space for a row of Nonpareil Cabbage, at 1 foot apart, which are now hearting; on their removal I shall sow in their place Rivers' Stubble Swede. This tillage may, perhaps, meet the view of Mr. Griffin, for I use manure.

The Cabbage is late in hearting, as well as small, and late in growth; but this does not arise from any malinfluence of the Wheat, although it is in some spots over 3 feet high, and with the leaves stretched, upwards of 4 feet. The soil is cold, and retentive of water, and reduced by previous severe tillage and starvation, to what the Irish very expressively term an anatomy (skeleton), and from a necessarily late and badly prepared seed bed, the plants were very small when put out the end of last October; besides which, from the mild and wet winter, and by the previous shelter afforded by weeds, the slugs have attacked them in myriads. As a remunerative crop, I cannot, therefore, this year boast of my Cabbage. There is enough, however, to satisfy me that there is every probability of the interlining plan becoming a profitable one, when the land shall be brought into a fit state for it. There is enough to lead me to expect in future years crops of grain equal, or very nearly so, in rows at four feet intervals, to broadcast crops, while they admit of the interlining of green crops in the spaces between the rows. *J. M. Goodiff, Granard, June* 13.

## THE BREEDING AND REARING OF TURKEYS.

The first point is the choice of the stock. We have found the black (or Norfolk breed I believe) to be the best; they are more hardy, and make the heaviest birds when fat, though they do not look, when alive, so large as the Cambridge; this is owing to the feathers of the black ones lying more closely to the body. I admit that some of the black and white, and more particularly those with bronze spots, are more beautiful; those that are all bronze are really very handsome, but as the object of the farmer is to rear the most profitable sort, I believe that none will be found more so than the black, at any rate it is so here. There should not be more than six hens to one cock, and neither kept after four years old—three is better, at any rate for the male. Each lot should be kept separate if possible; if only one farm-yard, they should be kept in separate houses, and as much as possible from mixing together, as your conveniences will allow. The male birds fight much.

If you are beginning to breed, you will buy your stock before Christmas, or earlier; they do not begin to lay quite so early the first year as after, but this depends in some measure whether they are early birds or late ones; never buy late ones if you can avoid it, as they are never so strong as the early ones. As soon as the hens begin to lay, see that they live pretty well, as they can pick up but little besides what is given them, and when you have got, say, eight eggs, if you have a hen (a common fowl) that is a good sitter, put them under her, for it is of much importance to get them as early as possible, for they are invariably the finest birds; that is if the hen turkey shows no disposition to sit soon. They sometimes keep on laying every other or third day for a long time; as soon as the hen turkey shows a disposition to sit, remove the eggs from the hens, if more than one are set with turkeys' eggs. A hen turkey will cover 16 well; if you have not that number, or they were put under the hens on different days, you may add to eight turkeys' eggs, 12 or 14 common fowls' eggs, provided the turkeys' eggs have not been sit upon more than a week; if not a week, wait till that time, as the chickens and turkeys should both be hatched at the same day, or at any rate within 36 hours of each other.

It is always desirable to let the hen turkey finish the hatching process, if only for one week; she is more steady and quiet in her ways; at the same time the heat, from her greater size, is more regular; during the hatching, the eggs require the same attention that I mentioned for fowls, and the young turkeys assisting in the same way, if they do not find their way out of the shell at the proper time. The young, when hatched, require to be crammed generally for some days with pollard, mixed thick, with a sprinkling of hard boiled egg, chopped fine, and Chives or scallion Onions (the green stalk), cut into small pieces, and mixed altogether. This is excellent food for them, and if fed with it till they pick it up themselves they will grow fast. The egg may be omitted after five or six days. The young turkeys require much attention in feeding till they will pick up the food well by themselves; if you throw it in lumps on the ground they will not eat it, but if you offer it to them in your hand, holding it at the ends of your fingers, you will find that they will eat it with avidity. They require much patience and attention, and for this reason it is useless for lady farmers to bring up poultry. They require most atttention when the weather is wet and cold, therefore have a man or boy who is fond of them. Keep enough to fully employ him always amongst them; they should be put on a pasture every fine day, and the mother confined in a coop, to prevent her from leading them too far away; they find many insects and worms, besides they soon begin to eat Grass. Insects seem to be the natural food of all the feathered tribe in their young state.

As soon as they are two months old, if fine weather, they may be put into a Clover field that you may be feeding off with sheep; this is a good place for them, and you may let the hen loose, taking care to have a rough shed made of a few hurdles, and covered with a little straw. Let your man take every morning all the food they will require during the day, and always feed them in the above-mentioned shed, so that they may be used to run into it whenever there is any appearance of a shower. Nothing is so injurious to young turkeys as a heavy rain. I have known a score killed by one heavy shower; it is best to have a sort of box made on wheels like a wheelbarrow, to carry the food required during the day; it should have a wicker basket to go on the top, about a foot high, similar to those we used to send fowls, &c., to market, and called "flats." This is to carry any of the young turkeys that may be unable to walk. If the field you have them in in the day is any distance from home, they will soon learn to run home at the usual time, if you give them the evening meal in the yard, before going to rest. We generally put the greatest number into a large barn to roost, fixing up temporary perches for them, and always making a rough sort of a ladder for them more easily to reach their perch. Turkeys should never sit more than 4 or 5 feet from the ground at any time; you should take great pains to get them to sit up on their perches, as they always seem to go on so much better when they roost above; no doubt from the better air they breathe when off the ground. They ought to sit up when two months old; when about this age they generally have what is called their red heads This is rather a critical period with them; they require much attention; it is best to separate those that are very bad, from those that are slightly affected; they will soon get over it if the weather is fine and warm. After turkeys have got their red heads they require little besides plenty of food and clean water; they may continue on the Clover field till after harvest; you should change the field as often as convenient—they do better on fresh ground.

As soon as any of the corn fields are cleared, you will, of course, turn them into the stubble. Wheat fields are almost useless, unless it shells very much; you should have them exmained every night, to see if their crops are full; if not so, you should have them well fed, with a mixture of half Barley-meal, and half steamed Turnips or Potatoes or Mangold Wurzel or Carrots; they prefer the fresh root and Swede Turnips, but they will eat any one of them well. I believe that this mixture is better than all meal, particularly when they have a chance of picking up all the corn they require. When you put them into either a Barley or Oat stubble, they will require hardly any feeding; the latter they are very fond of, and do best with.

I will here repeat a lesson I received some years ago, and have practised it ever since. Looking over the estate of a gentleman who is a great game preserver I found a lot of pheasants in a field of Peas that were very much bug eaten (covered with aphides), I asked the gamekeeper why they were put in; his answer was, "If pheasants are going on bad, and you have the opportunity of putting them on either a Pea or Bean field that has the bug bad, they will invariably get on better than by any doctoring you can give them." I then thought, if so good for pheasants, it must be just as beneficial for any of the feathered tribe, and I have found it so, both for young turkeys and chickens. You will of course not put them on in very wet weather, when it would both hurt them and trample your Peas down as well; they do no harm when the Peas are dry, but much good; they will do well on the stubble till a month or six weeks after harvest, or longer if the autumn is mild; but you should see that their crops are full when they come home at night. It is best to sell most of the hens during November or in the early part of December; they generally do best then. They require to be put up to fat for a month; three weeks will do if they have been kept well.

They should be in a roomy place, and let out for an hour or two during the day, not more; it is a good plan to give them a few small Beans when out, strewed on the ground. They should have plenty of mixed food when in the house, any kind of meal, but I think Barley the best; and the last week it should be nearly all meal. See that they have plenty of clean water at all times, as they drink much when shut up. The best thing to feed them in is long narrow troughs, made so that they cannot get into them; they must be covered over, or they will dung into them. Their perches should not be more than 3 feet from the ground when fatting, as they are very liable to bruise themselves in alighting; this spoils the look, as they are a long time before the slightest bruise leaves them. The turkeys should all be hatched before June; those hatched after are never worth bringing up, they are invariably affected with the cramp during the cold weather; and all the April birds are generally the most healthy, but it depends much upon the spring; if cold, the turkeys do not lay so soon. This is the case with all kinds of poultry, but more particularly turkeys.

Many persons in this county never hatch any turkeys themselves, but buy them of the labourers' wives, nearly all of whom keep one or two hen turkeys (the male is generally a joint-stock concern); this is often of much assistance to them, as they almost always have good broods; this is owing no doubt to the additional warmth of their cottages, as they set the turkey in a cupboard or closet near the fire. This adds little to the cleanliness of the cottage; but if fortunate in a good brood, it is of great assistance to them; the price is about 1s., depending upon whether they are early or not. They sell them when a day or two old.

I will say nothing about ducks or geese, as I do not think either pay so well as fowls and turkeys. Geese may do well enough where you have plenty of common land to turn them upon.

I will now say a few words upon what I consider a most important subject, connected with the rearing of poultry. It is perfectly astonishing what a quantity of most excellent manure you accumulate in the year. The best plan I have found is to burn a quantity of earth, generally the top spit round the sides of the fields; this answers two purposes, it keeps the weeds down, and is better than clay dug lower down; this burns well in fine weather, after being dug a day or two, it is then carted to some convenient place adjacent to the farm-yard, it is wheeled into the different places where the poultry is kept; a heap should be kept in one corner of the place, and a few spadefuls sprinkled over the floor morning and night. This is necessary to intimately mix it, as it is apt to get into large lumps if not done so. This will be found to keep the house perfectly sweet and clean. No straw should ever be in any poultry house, except in the nests. This is removed, when it gets a foot or more thick, into a shed, where it is turned over once or twice, when it is in a fit state to drill or sow by hand on any crop that may require it; it has increased so much on this farm, from the greater quantity of poultry kept, that it has led to more roots of all descriptions being grown every year, and necessarily to more stock being kept. This manure is particularly adapted for heavy land. It may not do so well for light land, but in that case I would dig marl or clay (if I could get it), dry and pulverise it, and use it instead of burnt earth.

I have tried this poultry manure by the side of the best guano, and the Turnips came up first, and for some time kept before those manured with guano,

but I think there was little difference at the time they were pulled. I do not mean by this to say anything against guano, for I have found in other experiments that the best results were from guano and poultry manure, being mixed in the proportion of two or three cwts. of the former to a ton of the latter. The cocks sell best about Christmas, but they do not do so well after. There is a very great deal of difference in the price from one market-day to another; sometimes 3*s.* or 4*s.* in the cocks—it is quite a lottery. I consider 15*s.* a pair a fair price, and I have found this about the average during some years.

I have no doubt that the remarks I have made respecting the rearing of poultry will bring forward many criticisms, and some ridicule; but if they induce only one farmer to give it a fair trial and the necessary attention, it will give me all the satisfaction I require. *E. X., near Braintree, May 5.*

## ON THE CULTURE OF FIELD BEET.

The land intended to be planted with Mangold Wurzel must be ploughed in the early autumn, and immediately on the grain being carried from the field. The first ploughing must be deeply done, not less than 8 inches, which may require three horses in the plough to move that depth. The autumn will permit a fallowing of the land, to be done in the common way of ploughing, harrowing, and rolling; and if the process cannot be fully accomplished, the land may be one-half or two-thirds prepared, and in that condition remain over winter, to wait the spring operations. It may be advantageous to gather the land into ridges by the last autumn ploughing, which will keep it drier in winter than when lying in the flat and newly ploughed state, in which it becomes "bleached;" and most certainly receives damage. The first furrow in the spring may reverse the ridges, and by filling the open meetings of the ploughings, a level surface will be again obtained. This one ploughing, accompanied by a severe harrowing in the last week in April, may be sufficient to fit the land to be dunged and planted, if the autumn fallowing was tolerably performed; or a cross ploughing may follow, and will prepare the land very fully, and also favour the drilling, which is best done after a cross ploughing; as the drill plough, in following a longitudinal ploughing, always slips into the furrows that have preceded it. If the land be only ploughed in winter, it must be fallowed in the end of March, and during April, by the common processes of ploughing, harrowing, and rolling, and repeated till the proper clean tilth be produced. The cool atmosphere of these spring months does not admit well the cleaning of grounds, and it forms an objection to Beet-root, that it requires an early, and often an imperfect preparation of the land. This circumstance may be very much palliated by the autumn fallowing of the ground, which much relieves the spring labour, imparts a consistency to the soil, and keeps much moisture to be husbanded for use throughout the summer.

Beet-root is planted during the first two weeks of the month of May, and the quantity of seed used on an acre is 4 to 7 lbs. The land being made ready, either by spring or autumnal fallowing, is made by the common plough into drills of 26 inches of interval, in which the farm yard dung is deposited and spread. The dung must be in the state of an active fermentation, which has been commenced for 8 or 10 days, and provoked by the turning over of the trampled heap in the corner of the field, which has been placed there during winter. It is essential that the dung be covered by reversing the drills immediately on being spread, in order that the gaseous effluvia which arise from the incipient fermentation may penetrate the newly stirred soil, reach the seed, and stimulate the vegetation. For this purpose, the drill ploughs must move close behind the dung carts, and cover the manure as fast as it is spread. The seed is steeped for 48 hours in urinary water, suds, or lyes, and dried with quick-lime, to suit the purpose of being sown. It is deposited on the tops of the drills in holes made by hand dibble, about 15 inches distant from each other. The two drill machines, as Hornsby's drop drill, are provided with cylinder cups, and coulters, which sow the seeds in a continuous stream, and with much accuracy. The quantity of lime that adheres to the moistened seeds has been proved to give a superiority to the crop, arising from the speedy decomposition caused by the lime of the albumen which the seed contains, and which is so very beneficially converted into food for the young germination. And when a plant acquires a superiority at this early stage of growth, it never loses it during the whole season. In either way of planting the seeds, the drills must be rolled without delay, which will level the cloddy surface, press the seed to the dung, and secure the benefits of the fermenting dung, and the exhalations from the newly stirred ground. The drill machine may be the better way of sowing the seed, as dibbling always makes a firmness on the sides of the hole made by the inserted prong, and it may be hurtful to the very young germination.

When weeds are grown, and the plants are risen wo inches high, the intervals of the drills must be ploughed and scuffled deeply and widely, to cut the weeds and move the ground. In the first operation, the cutting down of the sides of the drills is best done by a skeleton or small plough drawn by one horse, which, by going and returning in the same interval, takes a furrow from the drill on each side, and forms a small ridgelet in the centre of the interval. In every case of commencing the working of green crop lands, especially of the stiff-bottomed kinds, the narrow pointed share of the common plough pierces and moves the soil in a very superior manner beyond the knives, tines, or duck-footed shares of any scuffler yet known. But after the land has been "once" ploughed in the intervals, the two-knived scuffler will do well for the remaining work of the summer.

The hand-hoeing follows the scuffling of the intervals of the drills, which thins the plants singly to the distance of about 15 inches, always leaving the most healthy and vigorous growth of stem. At the same time, the hoe moves and breaks the ground between the plants, and cuts every weed. Unlike the Turnip, the Beet-root plant does not thrive by being laid prostrate, and attached to the ground by a small thread; it must stand upright, and be covered with earth to the neck of the young set.

After this process of scuffling and thinning, the Beet-root ground remains till the weeds are again risen, when the scuffler must be constantly employed, and repeated till the weeds are completely destroyed. In dry weather the benefit is very great of moving the ground in the intervals of the drills, as the stirring raises exhalations to be imbibed by the leaves of the plants, which, being broad and succulent, derive a great part of their food from the atmosphere. The scuffling must never be discontinued, except in very wet weather, and the second hand-hoeing will be done during the end of summer, as the growth of the weeds may require. It removes all weeds, singles the plants where two have been left together, moves the soil around the sets, and places them in the proper direction. The scuffling may be afterwards continued, if necessary.

In autumn, the outer leaves of the Beet-root plant begin to droop, and to show symptoms of decay. Some persons recommend that these leaves be gathered, by being stripped from the plant, and given to young cattle and sheep; while others assert, that the future growth of the plant is hurt by the leaves being pulled. But it may be very reasonably supposed, that leaves which are in decay, and which are nearly parted from the stem, have ceased to perform any office, and that the removal of them cannot be hurtful; and this observation has been confirmed by practice. In the end of the month of October, the crop is pulled, the earth and fibres cut away, and the Beet carried to the homestead; where the roots are built into a pile about 6 feet in width at the bottom, and about 4 feet in height, tapering into a narrow ridge at top, with the thick end of the roots outwards on the sides of the pile. The heap of roots is covered with a coat of straw in thatch, which admits the air, to prevent the perspiration of the roots; and severe frosts may be met with a covering, timely applied, of fresh stable dung in the rough strawy state. In this way, Beet-root can be kept in a very fresh condition till May and June of the year after they are grown. The tops and leaves are given to young cattle and sheep, and spread thinly over dry stubble, or lea pasture, where they are eaten greedily by cattle, but with much danger of hovin in moist weather, from the gaseous fluids which they contain. The quantity is to be restricted on that account. The leaves are not much relished by sheep; but to swine they are most particularly grateful; and in the open yard of store pigs, the herbage affords much juicy food, and an ample remnant for manure.

Beet-roots, either in a raw or steamed state, are very beneficially given to milch cows throughout the winter, and are found to increase the quantity of milk very much, but the milk is thought to be thin, and more watery in quality. In a raw state, there is no better food than Beet-root for pigs and young cattle. In the feeding of cattle, opinions differ about the value of Beet-root and Swedish Turnips; the most general opinion prefers the latter; and the experiments made by feeding cattle of equal age and the same breed, on the two different roots, have proved altogether inconclusive—because no two animals of any age or breed can be found to increase in equal weight, in the same time, from a given quantity of the same food. Beet-root is equally grateful to sheep; and in the spring months of the lambing season, it is most assuredly superior to the Swedish Turnip, when milking and not fattening is required. And the preserving of the roots in a fresh state till March and April is a matter of no difficulty.

Beet-root yields a greater weight per acre, both in roots and leaves, than any other root crop yet known, and must be placed near the head of the cultivated plants. But the general utility is inferior to that of the Turnip. The Beet requires a more particular kind of soil, which is of comparatively rare occurrence. The climate must be moist; and the seed is more troublesome in the management than that of the Turnip, and the crop must be wholly protected from the winter's cold. Probably from a lengthened cultivation and a gradually extended exposure, the plant may become acclimated, and withstand the severity of winter, as well as Turnips. This result might be attempted, by planting the roots of the strongest and most vigorous appearance, and by preserving the seed for future propagation, of those hearts that escaped destruction during winter, and bore seed the next summer. By persevering in this way for a period of years, it is very probable that the persistent quality might be conferred. The winter Vetch has been got from the summer variety in the above—chance directs the accidental productions of nature, and observation must adopt the exhibitions. When the land is autumn-fallowed for a crop of Beet it might be tried if the seed will withstand the severity of winter, by dunging the land and sowing the seed in the late autumn, as before directed. It is now proved that Potatoes, planted in autumn, live through the winter, and produce a heavier crop than by the spring-planting; and probably Beet-root might show the same results. The seed being in the ground would produce an earlier crop than the spring sowing.

Einhof states that 18 tons of Mangold Wurzel are equal to 15 tons of Ruta-baga, or 7 tons of Potatoes, or 3¾ tons of good meadow hay, each quantity containing the same nourishment; but then the above quantity of roots can be grown on less than an acre, whereas it will take about three acres of meadow land to produce the equivalent quantity of hay.

It was very early observed that Beet-root was a plant of a very saccharine nature, and that crystallisable sugar was easily to be obtained from the juice of the roots. The manufacture of Beet-root sugar sprung up in France under the superintendence of Chaptal, the eminent chemist, in consequence of the decrees that were issued to exclude the colonial produce of Britain. When the sugar is refined, it cannot be distinguished from the cane sugar, either by the taste or appearance. Five tons of clean roots produce about 47 cwt. of coarse sugar, which give about 160 lbs. of double refined sugar, and 60 lbs. of inferior lump sugar. The rest is molasses, from which a good spirit is distilled. By distilling the juice of Beet-root, after it has undergone the vinous fermentation, a very good spirit is obtained, and also a kind of beer, which is said to be pleasant and wholesome in warm weather.

Professor Lampadino obtained from 110 lbs. of roots 4 lbs. of well-grained white powder sugar, and the residuum afforded 7 pints of spirit. Achard says that about 1 ton of roots produced about 100 lbs. of raw sugar, which gave 55 lbs. of refined sugar, and 25 lbs. of treacle. This result is not very different from that of Chaptal in France.

Another variety of Beet has been lately introduced called the "Turnip-rooted or Orange Beet," from the colour of the root. There has not yet appeared to be any difference in the quantity or quality of that variety of the plant that is deserving of any special notice. *J. D.*

## Home Correspondence.

*Village Excursions.*—The inhabitants of Whitfield and Falfield villages have to thank Prof. Henslow, and his suggestion on this subject, for one of the pleasantest days that ever was spent. On Tuesday last about 80, including some of the farmers of the neighbourhood and their friends, with many of their labourers and their friends, and about 30 of the girls and young men of our village singing class, crossed the Severn, visited Chepstow Castle, Tintern Abbey, and the banks of the Wye, where we found the old echoes answering more merrily and musically than perhaps ever before they had been known to do. Some of us, who could speak of other parts of the island, agreed that no where is there a more delightful spot for the visit of a holiday party; and it was voted unanimously, that if there never was such a place, certainly there never was such a happy party of visitors, nor such a splendid day as they had for their enjoyment. What with gigs and carts and waggons, we reached home at 10 o'clock of a magnificent moonlight night—sang our last songs in the midst of the village, surrounded by those who had not been able to join us, and, after three hearty cheers, bade one another good night. I send you this short notice of our experience, because I think it may induce farmers in other localities to unite with their neighbours in the enjoyment of a holiday after a similar fashion. *M. S., Gloucestershire.*

*The Sugar Beet and Irish Tobacco.*—You are quite right in believing that "it is not due to misgovernment, that the sun in its natural course does not rise much over 60° above our horizon," but quite wrong if you suppose that the sun of Irish prosperity is not lowered by the same cause. Such, at least, is the "idolatry" of 99 out of every hundred men in Ireland capable of judging between right and wrong; and such I believe is the opinion of many Englishmen, too, on both sides of the Channel that divides us. And much as we "idolise" Dr. Lindley, as a great philosopher, we never for a moment supposed his power to be Joshua-like, in the case of the sun over our natural horizon; but we believed, and still believe, he has damaged our cause (unintentionally) in Irish Tobacco growing, which, to be again successful as it has been before, requires no higher sun than that which Nature gave, and still gives us, but of whose benefits man has deprived us by bad, taxing laws. Facts are stubborn things, and here is one out of hundreds which I could give of my own knowledge. We have made from 50*l.* to 60*l.* per statute acre, or from 80*l.* to 120*l.* per plantation acre, of Tobacco grown in this county; nor did we ever, to my knowledge at least, even require Dr. Lindley's aid to enable us to do so. All we required of him was, and is, to throw no obstacle in our way if we attempt to do so again by legitimate means, in the repeal of what we know to be a bad law. And all we require of you is, to suspend your opinion on the subject of sugar manufacturing from Irish-grown Beet, till by our own industry we can enable you to form a more correct idea of what we can do in that respect. If you cannot conscientiously aid our efforts, you can, in my humble opinion at least, without any qualm of conscience, allow us to try our hands at our own risks, without, as I before said, "throwing cold water" on our infantile struggles. I have already told you that Irish-grown sugar Beet delivered to the sugar manufacturer at the clear price to the farmer of 10*s.* a ton, would pay him better than Wheat delivered to the miller at 25*s.* a barrel. I am now better prepared with proofs practical, and mind I am speaking of some of the best ordinary

Wheat growing lands in Ireland at least, and have said nothing of the millions of acres now waste in Ireland that never could be made to grow a good or fair sample of even Irish Wheat as it is, but quite capable of growing sugar Beet, and other crops of a suitable kind in succession, of better quality than could be grown on the best Wheat land in the kingdom. You will please observe I am speaking now from practical experience, not as a mere theorising philosopher. I am "trusting to industry and perseverance in the ordinary means" of our country, "for which her climate fits her—not to that fitful energy which seeks a sudden fortune in doubtful matters," but in "the right policy for Ireland if," not as you say, "she could be *led* into it," but as I say, if she would be *let* into it. You talk very calmly, as you are wont to do, of "patient continuance in well-doing," as if you believed what no other man, if he knows Ireland, can believe, that as things are going on, that any man outside the Government officials can be said to be "well-doing." Will you please turn to our census reports, to our even cushioned poor-house reports, to our emigration reports, to our commercial reports, and have a sharp look-out for the exaggerated agricultural statistical reports, now being made out by our constabulary, look to our poor-rates, look to the "ration aid," now levied off the industrious, for the support of the idle and profligate in high and low quarters, and then ask yourself, are we "well-doing," or likely to do well? Come over amongst us, and judge of us as we are; and trust not to the misrepresentations of interested parties, who would picture us as we are not, and then judge for yourself impartially of what we ought, can, and will be, if even-handed justice be but doled out to us; and such laws given by our governors as will compel us to do justice to one another; for mind, in my enthusiasm, as an Irishman, I am very far from thinking we are more infallible than the other sons of Adam all over the world. All we want is fair play; and if I am not much mistaken in you, you at least will give us that in as far as you are personally concerned. Do us justice, and you will find us good and faithful allies; but if you deny it us, you will, in the end, have ample cause to regret it. *Edward Carroll, Aug.* 27. [Does Mr. Carroll mean to say that it will pay to grow Irish Tobacco for 3*d.* or even 6*d.* a lb., which is its outside value, if *not protected?* Or does he mean that it ought to be protected, in order that the Irish may inundate our markets with a bad article at 10 times its real value?]

*Poultry.*—On reading the article by "E. F. W.," on Poultry, I was much struck with the similarity to my own birds; and perhaps it may bring to light some facts respecting the breed, if persons of experience will state what they know on the subject. I bought a white Cochin China cock and a grey cock, and let them run with some buff-coloured hens and grey hens; and I find all the chickens from the grey and white cocks, with buff hens, are of the different colours quite pure; for instance, the buff chickens have not a white feather; neither have the grey birds a red feather, which I think, with "E. F. W.," is very unusual, as out of 50 chickens some would have shown mixed colours. *W. Turner.*

*Draining.*—I have not forgotten that I owe each of two of your highly respectable correspondents a letter, namely, Mr. Cuthill on Game, and "Inquirer" on Draining, and I have decided to give the latter the precedence; and in order that your readers who take an interest in this discussion may understand the subject, I must beg them carefully to call to mind what has already been said about it, both by "Inquirer" and myself. They will remember that I myself commenced the discussion by an article condemnatory of open furrows, which I showed could only be tolerated as the less of two great evils, namely, where land, from some cause or other, could not be drained, or where it had already been drained imperfectly, or, I might add, injuriously. I also stated that shallow draining was of more injury than benefit to land, and I now state that by shallow drains I mean all drains which are made not to exceed 3 feet in depth; or all such drains as gained the late Mr. Smith, of Deanston, the high reputation he held among farmers, both landowners and tenants, as the king of drainers. Three preliminaries, or I might write four, are necessary preparatives for men to understand why they should drain land, and how to drain it; namely, the nature of caloric, or what chemists call the matter of heat, and the sciences of hydraulics, hydrostatics, and geology. If men in general understood these four branches of the sciences, we should hear no more advocacy of shallow draining, nor should we ever see in the fields those insults to our understandings—open furrows; and as for that twaddle about water not being able to get down into deep drains through stiff clays, which we hear so much of, why that would be annihilated for ever. Some years since Mr. Parkes published in a pamphlet, and which was the only article I ever saw on draining worth reading, some valuable experiments he made with the thermometer by placing it at different depths in drained and undrained ground, to find the different temperatures of it, and to prove the advantages of deep, and the uselessness of shallow draining. The experiments showed Mr. Parkes to have been a philosopher; and I had no sooner read them, than I said to myself, "Here is a wise man, many years in advance of the age in which he lives; his pamphlet imparts sound wisdom, but few or none but the wise will regard it." The wise and great, however, did regard it, for we soon afterwards heard that Mr. Parkes was draining the estates of the Duke of Wellington, and of Sir Robert Peel, two of the most illustrious men that the world ever produced at one time. But, as well as Mr Parkes, I also have for years made many experiments to test the influence which the internal temperature of the earth has on vegetable nature; and I beg to state, that the results have been to me so conclusive, that they have formed the ground-work of many of those articles with which I am aware I have pestered not a few of the readers of the *Agricultural Gazette.* From time to time I placed on boards and on deep and thoroughly drained land, and on land half drained, and on land not drained at all, pots containing Pelargoniums. All the plants were of the same age, and nearly of the same size, and all the pots of the same make and size. The plants placed in the pots on the boards flourished very fast; those on the well-drained land were the next best; those on the ground half drained were the next, and those on the undrained land remained nearly stationary, and some of them actually died. At another time I placed pots of flowers on slates in juxta-position with others on boards, and again those on the boards flourished perceptibly the most. The scientific reader will perceive that Mr. Parkes' experiments with the thermometer confirmed the truths of those of myself; and he will excuse me if I observe to him, that if he be a cultivator of the soil, he is merely groping in the dark if he be not in some measure guided by the truths which these experiments have developed. Cold and wet ground rapidly conducts the caloric from the earth's surface to the colder regions below the surface, and the more stagnant water there is in the ground the more rapidly will the caloric leave the surface to keep up the equilibrium below it. Now, as all vegetation is on the earth's surface, and as the greater the amount of caloric there, the more rapid and luxuriant will be the growth of all kinds of vegetables; it is quite clear that the object of the farmer in draining his land ought to be, and it would be, if he knew what he was doing, to get rid of as much of the cold stagnant water below the earth's surface as he possibly can. But can he do this by shallow draining? No, he cannot; shallow drains can take off the water only which falls on the land from the clouds of heaven, which every wise man would do his utmost to retain. In order to raise the temperature of the ground, and get rid of the cold and noxious water out of it, you must drain deep and well, or your money will be thrown away, and your labour will be in vain; but do this, and you will soon learn to rejoice that you wrote anonymously when you told the world that the top or rain water alone hurt you. I have more to write, but must not occupy too much just now, but trouble you again. I must, however, ask permission to refer again, and without offence, I hope, to your readers, to what in modern phraseology, is called box feeding, as the above reasoning I have made use of is equally as applicable to animal as it is to vegetable physiology. It will be remembered that I have condemned, and in language as strong as I could use, the monstrous novelty in cattle treatment called box-feeding. I still consider it to be a satire upon the age in which we live. But in applying what I have said above to animal physiology, I observe, that in feeding any animal—the ox, or sheep, or pig, for example—the animal should be kept as nearly as possible at a certain temperature; he must be neither too hot nor too cold. If he be too hot he is prevented from fattening by evaporation; if he be too cold, he requires much more food than at a proper temperature, because a part of it, according to the degree of his coldness, is required to keep up the heat of the body. *Geo. Wilkins.*

*Windsor Cattle Show.*—Though our remarks upon this show of stock are offered late, yet we cannot refrain from observing that there were many lots which might have been kept at home by their owners, and only tended to destroy the general character of the mass of superior stock exhibited. These objectionable animals might have remained in their stalls or yards; upon the same grounds many aldermen of the city of London, according to the *Times*, might have refrained from attending the *fêtes* in Paris. There were also numerous pigs, which came from afar, which had nothing to recommend observation, save their ugliness and obesity. We must say that we think no pig, boar, or sow, ought to be candidates for a premium after the age of 18 months; the Society's aim and object being to extend and promote a profitable race of animals—that they should "increase and multiply," not return home to be slaughtered and, in the shape of flitches, be seen at Christmas adorning a bacon rack. Hampshire connoisseurs do not relish bacon of hogs two years old—but then this tough bacon is prize bacon—the silver medal may dangle from the flitch and render it more palateable and sweet. We do not object to see any boar or sow of superior shape being exhibited at all after the age of two years, but they might be shown as "extra stock;" yet they should be handsome, and thus add to the character of the show. The Society cannot divine what creatures are coming. *X. Y. Z., Hants.*

*Relief to Tenant Farmers.*—It is with a considerable degree of satisfaction I read, in a paragraph in your newspaper, the proceedings of an association, formed in the neighbourhood of Ipswich, to obtain relief for the tenant farmer, under the depressed state of agriculture; not by protection, but by a removal of the abuses which exist nearer home. I congratulate my brother farmers that they have at last taken a step in the right road. The five subjects which the association proposes to consider are all highly important, but that of tenant right is as much, if not more so, in my opinion, than any of the others. The repeal of the malt tax would be beneficial, principally by enabling the farmer to use malt as food for stock—a better article than which he cannot obtain for fattening cattle, except it be linseed-meal, given according to Mr. Warnes' system. In any other point of view I cannot see that it is a tax which falls more heavily on the farmer than on any one else; and indeed, in some cases, not so much so as on many others. The alteration of the present tithe system, although very important, is not so much a subject for the consideration of the tenant as the landlord—it being, in fact, a question between the landlord and the tithe owner; and were any steps taken to alter the assessment so as to reduce the tithe, the tenant would, in all probability, find shortly afterwards his rent proportionately increased. The subject of tenant right, as I have stated above, is of all things most important; and I firmly believe that three parts, if not more, of the tenant farmers' difficulties might be traced to the want of it; for what can be plainer than this—that if you prevent a man from making improvements in his business, you materially interfere with his prospering in it. And do not landowners hinder their tenants from making improvements, by refusing to grant leases, and by refusing to make a fair remuneration for permanent improvements, to which a tenant is justly entitled? I say most assuredly they do; and I hope the time has arrived when landlords will see the need of this, and of the importance of giving every facility for a better system of farming, by introducing liberal covenants, instead of the fettering conditions which now disgrace their leases and force men to farm badly. *T. R.*

*Potatoes in Ireland.*—Since my last, of the 4th inst., the disease in the haulm has not only made its appearance here, but has spread with much rapidity, so much so, as to give the fields a blackened appearance, and to be smelt as they are passed by; but the tubers are not as yet much touched, possibly not more than one or two in a thousand. I think it probable that before the middle of next month there will not be a green stem left. Yet some kinds of Potatoes, and some places, are worse than others. Under our present expectations, and if the tubers do not become more affected by the disease than has been usual since the first two years of its appearance, we may reckon on two-fifths of a crop. The alarm, however, has been so strongly excited, that a very great impetus has already been given to emigration, as is evidenced in the rise in the amount of the passage money to America, which, I believe has risen within the last fortnight from 2*l.* 5*s.* to 2*l.* 17*s.* 6*d.* The whole hope of the country rested, and with much justice, on the soundness of the Potato crop; it is the only anchor that can bring up our labouring vessel and its cable parted, and all will be wreck and ruin. No labouring man, no small farmer, no woman of the humbler classes, that can obtain the price of passage to America will remain, and England will long rue the day (while future Governments curse the negligence of the present), that so fine, so intelligent, a labouring people has been driven to expatriate. [National prosperity is just the aggregate of the prosperity of individuals. We do not believe that a society with a more patriotic object could be formed than one to *promote* emigration.] Formerly the labourer and the cottier would, at harvest time, make their way over to England, or to the eastern side of the country, to earn high wages, to pay the conacre Potato rent, or that of the little farm; now it is to make out the means of quitting, as they call it, "this poor unfortunate country." The great object is to send some one of the family that is likely to acquire in America the means of sending for other members of it, and the expedient is rarely unsuccessful. The father leaves his wife and family, the mother her children, the maiden her lover, in the assured expectation of acquiring, by their labour, in that go-a-head country, within a few months, that which will enable them to rejoin them; and the most good-for-nothing here is sure to do well there. [Then why lament that they are going where they will be better off!] It is not more than two years ago that the broken-down, indolent, lame, and weakly occupant of part of the land I hold, left his wife and nine little boys for this El Dorado of the west; he has twice, in that time, remitted small sums to his wife, and has now sent over 11*l.* to defray the charge of sending out his two eldest sons. It is expected by their joint labours they will be able to send for the mother and the other children at an early period next summer. And what is the remark of the poor man who knows this matter? "If Paddy is able to this, who need fear going to America?" Twelve months ago, a man who had gone to America previously, and left his two children with his brother, one of which afterwards died in the poor-house, sent money to his brother to pay for the passage, &c., of his remaining child, and his brother's wife; the woman was not more than six months away when she also remitted sufficient money to take over her husband and her child. These persons were in my employment; and thus of six men and youths I employed, three in twelve months have emigrated. But to return to the Potato; much as the country suffers from the loss of it, the culture of it is not to be abandoned, on account of its liability to disease. It is a question which, I think, may be solved in the affirmative, that the market grower of it suffer no loss by the disease. It is probable that last year's crop was, from the early appearance of the disease, half lost, yet the price of the remainder was highly remunerative; it ranged through the winter in Granard market from 6*d.* to 8*d.* a stone. It was calculated, before the disease came on, that, from the quantity planted, Potatoes would be got for 2*d.* a stone. The case is, however, very different to the poorer farmer, who grows them for his own consumption alone; as, in their failure, he is compelled to consume the grain on which he depended for paying his rent. Their high price also con-

fines their consumption to the more opulent classes, while the lower classes severely feel their loss from the same cause that the smaller farmer does—being compelled to feed on grain. Now as this grain is for the most part Maize, the immense sums drained from the country for the supply of food, and without any other return than that which the emigrant makes, and which for the most part goes into the hand of the Liverpool shipowner, must, added to the use of a higher priced diet, and the daily breaking down of every property and of every interest, soon bring ruin to the doors of every one. Have we turned the corner? I have just learned that in the neighbouring parts of Cavan, the Potato fields, with some very few exceptions, are as withered as at the digging in, and also learn that they are equally as bad in Westmeath. My own and my neighbours' are becoming rapidly diseased in the haulm; daily its progress is seen. *J. M. Goodiff, Granard, August* 19.

*Agricultural Units.*—The enclosed paper seems to illustrate so forcibly the importance of proper cultivation and adequate manuring, that I am induced to offer it to you for insertion in your next Journal. The farms from which the ears of Wheat were taken, are in the same neighbourhood, in Staffordshire, not a mile and a half from each other, forming part of a large district, which was equally affected by blight of the Wheat crop. The ears of Wheat were selected from each field, by the same party going into a part of the crop of average strength and appearance, embracing as large a portion as he could within his arms, and then from that quantity selecting 10 average ears. This was done twice over, with about the same result. The trial, and the result, and its explanation, seems to me to afford a useful lesson to the agriculturist.

—*H.*

*Irish Peat Charcoal.*—I tried last autumn a dressing of this article, steeped in liquid manure from the farm-yard tank, to winter Beans, and, on an equal portion of land, side by side, a dressing of dung from the yard. The quantity of charcoal applied was at the rate of three tons per acre, costing (without liquid manure, in which it was steeped) 9*l*. The quantity of dung applied (and which was of very moderate quality) was at the rate of 40 one-horse cart-loads per acre, of the value of about 5*l*. Having harvested and threshed the crop, the following are the results, viz.: From the land to which the Irish peat charcoal urate was applied, 40 bushels per acre; from the land dunged, 72 bushels per acre. The land is very light—subsoil, at 20 inches depth, chalk. This experiment shows conclusively that whatever value there may be in Irish peat charcoal, it cannot be compared with ordinary farm-yard manure; the crop was little more than one-half, whilst the cost of the dressing was nearly double. The Beans were sown in rows 30 inches apart. *P. K.*

*Lime.*—In No. 34 of the *Gardeners' Chronicle* appears a lecture on lime by Professor Way, together with a lengthened conversation on the same subject by various other gentlemen then present. I have carefully perused the lecture, and the report of the remarks which it elicited, and I am quite unable to deduce therefrom a direct answer to the following queries. What is the kind of soil more peculiarly benefited by the action of lime? What is the kind of soil where its action is less beneficial, or perhaps negative? What is the kind of soil where its action is injurious? In my neighbourhood there is a great deal of limestone, and the land is mostly clayey, and stiff, on limestone rock. Now the farmers, who are bound to bring on the land manure in the place of hay and straw which they sell, consider that they acquit themselves of this obligation by drawing coal, and getting the stone, and converting the same into lime, with which they dress the stiff land on the limestone. Now it is of consequence to know the action of lime on such land. If you tell them that you doubt its efficacy, they reply that at all events it makes the land work better; meaning that they can get the clods to pieces more easily after a dressing of lime. Permit me also to ask in what manner is lime applied as a dressing to Grass land? The importance of applying science to practice, at a time when Wheat is likely to attain a lowness of price hitherto unknown in England, must be my apology for again intruding upon you. *Enquirer.* [You should read Prof. Johnston's book on the subject. We will give a review of it shortly.]

## Farmers' Clubs.

Haddington.—Mr. William Howden, Stonelaws, the chairman, intimated that the subject of discussion was the *Best method of Harvesting and Preserving Grain.*—Mr. H. Whittingham said:

Having been called upon by the chairman, he would simply give a few remarks to begin the discussion. He had for some years employed bands of men from Aberdeenshire to mow his Oats, which they had done to his satisfaction, at a cost from 9*s.* to 9*s.* 6*d.* per Scotch acre; there was a great saving in food, particularly in wet weather. The general objection against mowing was the number of heads at the bottom of the sheaves, but were the rakings bound up together and threshed separately, this objection would be almost altogether obviated. He and many of his neighbours had tried the scythe with Barley, and found it equally suitable. From some cause or other, during two years, but few Aberdeenshire men had come to the county; but he would particularly recommend the scythe for opening up fields, before the regular band of shearers were taken to it. It would be found much more profitable to send a steady man with a scythe to do this, in preference to half a dozen shearers out of sight of the master. In finishing fields, too, the scythe would be found very advantageous, long or short rigs made very little difference to it; but every one acquainted in the least with the superintendence of shearers knew, that one acre at the close of a field took longer to cut than two or three in the middle of it.—Mr Hope, Fenton Barns, said it was very much to be regretted that some members of the Club did not come prepared to open this, and every other discussion. If they intended to confine it to the conversational mode hitherto adopted, it would be as well at once to take steps to prevent any report of what was said appearing in print. When they looked at the way other clubs discussed subjects, they must be sensible that they suffered grievously by the comparison; and this arose not from any lack of talent, but from carelessness and want of arrangement. Happily, however, the subject at present under consideration embraced so many points, on which there were differences of opinion, that were these points steadily kept in view a large amount of information might be elicited. There was first the degree of ripeness at which grain of various kinds should be cut; for himself he thought this depended much on the season. In warm, sunny weather the straw was ripe before the grain; at all events, it was then necessary to have the straw properly ripened. In some seasons the grain was ripe when the straw was green; it was only then that green cutting merited the praises that were sometimes bestowed on it. In the second place, whether the crop should be cut with the scythe, as recommended by Mr. Hepburn, or the scythe hook or the teethed sickle. He used the scythe hook, and recommended slashing, but if a reaping-machine could be obtained to do the work, it would be the greatest boon that the farmers in this country could obtain. He hoped they were all going to see the Exhibition in London; he would recommend to them to examine minutely the American reaping-machine, which it was advertised would be put in operation in the neighbourhood of the metropolis, as soon as grain was in a fit state for cutting. At present farmers had to lodge in their premises a great many people for two or three weeks, over whose conduct off the harvest field they had but little control. Large numbers of men, women, and children had to sleep in the same apartment, by no means to the improvement of their morals. However anxious farmers as a body or individually might be, it was, he was sorry to say, impossible to remedy this. His only hope lay in an efficient reaping machine, which, if obtained, would be to him a source of the greatest happiness, setting aside profit altogether, though he had no doubt he would obtain that too. When the grain is cut there is the size of the sheaves, the making of the bands, the number of sheaves in a stook. Are head sheaves to be recommended? Then comes the stacking of the grain, the heading of the stacks. The proper period for threshing it follows, whether it is better to thresh all out early and store the grain in granaries, or by the use of rick stands, such as those manufactured by Messrs. C. Young and Co., or those simpler and cheaper, but not more economical in the end, made of wood. It cannot be doubted but a number of the stacks should be retained until near the next harvest, but the greater part should be threshed during winter, or as soon as the grain is in condition. It might then be stored with advantage, that the whole crop might be brought regularly to market. He did not approve of much threshing during summer, when work was abundant in the fields, besides the loss sustained from the straw not being converted into manure is occasionally a consideration. Even for straw to be used during summer, its being previously threshed and stacked was no loss. That was a slight sketch of some of the points into which the subject naturally branched, and by taking them up in the manner indicated, he had no doubt would be found profitable.—Mr. Shepherd, Gleghornie, remarked:—To begin at the beginning of Mr. Hope's sketch, viz., the proper period for cutting grain, it appeared to him that many a good crop had been spoiled from mistakes made regarding it. The late Mr. Brodie, of Scoughall, a man whose opinions deserved every respect, published a paper on the advantages of cutting green, and he (Mr. S.) had followed him particularly last year, from having got a fright with the high winds at the beginning of the harvest, but he would not again cut green Wheat, as it gave it a bad colour, and rendered it difficult to sell. The Wheat at all events should be properly formed before being cut. Beans also should be well ripened, as green cut was very detrimental to the appearance of the sample. So much for the first head of the discourse.—Mr. Davidson, Holynbank, a reed in the main with what Mr. Shepherd had said. He, however, did not think it was generally advisable to wait until the whole crop was thoroughly ripened; a great deal depended on the season. Barley, in particular, he thought should be thoroughly ripe before being cut, as so much of the value depended on its quality. As to the system of housing grain in large barns, he thought it barbarous, and that the English farmers in this case might take a lesson from their northern neighbours, who lived in a more inhospitable climate. He strongly recommended the stances of Messrs. Young and Co., as it did not answer at all to allow grain to remain in ordinary stacks during summer, from the loss sustained by the depredation of vermin; he had seen 36 rats killed in one stack.—Mr. Harvey, Stevenson Mains, observed that it was usual in this county to set up stooks of eight sheaves. In Mid-Lothian they were frequently made of 10 sheaves and two head sheaves; he thought it possible that the head sheaves might frequently prevent Barley being discoloured by mists from the east, which were rather common in this district. The value of Barley depended very much on its colour. He (Mr. H.) thought four shearers enough for one banster; in fact, with a good crop it was impossible for one man to bind to six people, which is the usual number. As a general system he thought Wheat should all be threshed out by the middle of April and stored, unless when preserved by proper stances or otherwise from the vermin.—Mr. Shepherd differed in opinion from Mr. Harvey and from the practice followed in some counties of putting 12 sheaves into a stook, as it was a mighty object to get the grain matured in the shortest possible time. When he first came to the county he was startled by the plan of four sheaves, but he found that they dried much faster, and he highly recommended it, and more particularly near plantations.—Mr. Douglas, Athelstaneford, did not agree with the writers in favour of green cutting, as it destroyed that bright colour which all fine grain has. Potato Oats was the only crop that should be taken sharp; his rule was to cut them when the top pickle was completely white. He had tried all the three modes of cutting. With heavy crops he did not find the scythe suitable, and there was less shake with the hook. At one time he bought teethed hooks for all his people, but he lost patience and went back to the scythe hook. He thought it a good remark by Mr. Harvey that six reapers were too many for one banster; besides, when there were only two people on a rig, each person had to do his own work. He had no objection to learn the people on his own farm to shear, but it was too much to be imposed on by idlers who demanded full wages, and there were often two good shearers on a rig and one bad one. He thought farmers were not strict enough, with regard to the size of the sheaves; they could not be too small, provided they would stand. As to the size of stooks, he did not approve of the four sheaves; they might do in calm weather, but they were easily blown down; not one man in 20 could put them up to stand; a larger number stood better, and were more easily set up again in the same form when blown down. As to head sheaves they were suitable for a wet climate, but not for a dry country like this. He highly approved of bosses and triangles for bringing grain in the stack speedily into condition. He thought a board across the stack with a drain tile upon it very advantageous, as it produced a current of air. When grain was threshed out early, the straw was converted into manure in good time for application to the green crops of the following summer; but, in general, on the farms in East-Lothian there was a sad want of granary room, for which both landlords and tenants were to blame.—Mr. Scott Skirving, Campton, said, tying the sheaves with only one length of straw, completely prevented them being made too large. He highly approved of only two shearers on a rig, and urged its general adoption, as it was exceedingly difficult for one man to do it. Reapers came in bands of three, for the purpose of working together, and unless they were allowed to do so, they would not otherwise engage. He hoped the American reaping machine which had been alluded to would be found suitable, as it might be the means of saving a large expenditure.

## Notices of Books.

*Flax: the Culture and Preparation in Scotland, Ireland, and Flanders, particularly with reference to the Western Highlands and Islands of Scotland.* By Robert Brown, Esq., Hamilton. Pp. 54. Blackie and Son, Glasgow, Edinburgh, and London.

We have noticed many of the pamphlets and works published during the past two years on this subject; and the above is one of the best, as it is also one of the cheapest of them. It gives the most detailed description of the plant, its cultivation and management, in all the stages of its growth, as well as after harvest; its refers particularly to the modes and processes of the Flax grower, both in Ireland and in Flanders; it discusses the modes of preparing the crop for the manufacturer, advocated by Schenck, Donlan, and Claussen; and it applies the information which it conveys especially to the circumstances of North-Western Scotland.

Any one with Mr. Brown's pamphlet in his hands, and a practical knowledge of ordinary farm practice in his head, may start Flax growing next spring, without fear of the result.

## Miscellaneous.

*Adulteration of Guano.*—We see no good reason for the apparent alarm that seems to exist with respect to the late trial of Pickering and Long. It is just one of those cases of glaring fraud which, in numerous businesses, are constantly brought to light by the activity of the police; and the effect of which should be to induce to greater care in the future, as it undoubtedly will in the present instance, on the part of all concerned. But the fact of the fraud discovered, exposed, and punished, is no more an argument against the use of guano, as some seem to think, than the robbery of a bank

parcel, or the forgery of a cheque, would be against the use of banks. On the contrary, the facts furnish a guarantee, that in future no such frauds need be apprehended. On the one side the sellers will take care that such opportunities for adulteration shall not be afforded in future; and, on the other hand, the buyers will be more on the alert as to the condition in which they receive it. To both, the exposure will be at once a useful warning and a guarantee against its repetition. Fortunately the high position of Messrs. Gibbs and Co. in the commercial world is, of itself, a sufficient guarantee that every means will be taken on their part to secure the delivery in a genuine condition; but it will be equally necessary that buyers should exercise a vigilant supervision, in order to secure themselves against similar frauds as that to which we have alluded at any stage of its carriage, and in its examination on arrival. We need not remark upon the necessity of using every possible precaution to obtain this article in its pure state, for it is one of those cases where the consequences of fraud are not confined to the mere loss sustained in the purchase. It leads to a far greater loss in the failure of crops from insufficient fertility, which a genuine quality of guano would have prevented; and after the exposure which has taken place, we cannot too strongly recommend purchasers to use every precaution in their power to prevent adulteration between the delivery from the ship and its arrival on the farm. But while we do so, we can see no greater difficulty in preventing fraud in guano than any other article, if due caution be used. But great as has been the increase in the consumption of guano in past years, the importation of the present year, so far as it has gone, shows a still more rapid increase. A reference to the Board of Trade tables will show that for the first seven months, that is, from January 5th to August 5th, the quantities imported were as follows:—1849, 51,480 tons; 1850, 69,937; 1851, 131,009. Thus showing that the import of the present is proceeding at the rate of upwards of 220,000 tons in the year. *Economist, abridged.*

*Two Tons of Salt per Acre!*—To Mr. William Fair, Aston, near Great Budworth, Cheshire, as tenant and occupier, for the best crop of Swede Turnips, not less than 8 acres, 5*l*. Inspectors' Report: This claimant's farm is 122 acres, of which 14 were in Turnips. The previous crop had been part Wheat, part Oats, and part old Grass. The soil a good deep loam, with a sandy clay subsoil, drained where required, and lays in a good climate. The land was manured with 6 cwt. of guano per acre, and 2 tons of salt per acre had been applied the autumn before. Dickson's (of Chester) "Purple-top" seed was sown from May 15 to June 7; drills 26 inches wide, and the plants 13 inches apart. The crop was even, and the bulbs equal in size, but they had rather coarse roots and longish necks. The land was clean, and in a fair general state of management. Inspected October 22, 1849. Average weight per acre, 40 tons, 4 cwt., 1 qr., and 4 lbs. *From the Journal of the Manchester and Liverpool Agricultural Society.*

*For Improvement in Apparatus for Milking Animals.* Patent dated February 10, 1851. William Edward Newton, of Chancery-lane, civil engineer.—This improved apparatus consists of an air and water-tight bag, composed of india-rubber, gutta percha, or other suitable material, encircled by an elastic strap or band at top, and provided with an aperture at bottom, fitted with a silver tube of a size capable of entering the milk duct of a cow's teat, which tube is provided with a piston also of silver, and packed so as to be air-tight; or the piston may be made of gutta percha, in which case no packing would be required. When using the apparatus, the bag is turned down, so as to expose the silver tube, which is inserted in the milk duct of the cow's teat, and the bag is raised all round, so as to enclose the teat, and prevent the air entering; the piston is then withdrawn, and a free passage left for the milk through the tube into a can placed underneath. The flow of the milk is facilitated by the contraction of the elastic band round the mouth of the sack, and by warmth caused by the exclusion of air between the sack and the cow's teat, which is about equal to that produced by a calf in the act of sucking. Claim: The sack made of india-rubber, or other suitable water and air-proof material, in combination with the strap or band for compressing the teat and neck of the sack, and the exhauster tube and piston, or either one or more of the foregoing parts in combination with a sack for the purpose of milking cows.—*Mechanics' Magazine.*

## Notices to Correspondents.

BARLEY: *J S G.* You may sow winter Barley towards the middle of next month. Any corn sown in early autumn may be very thinly sown. We should prefer sowing Peruvian Barley in early spring. To sow salt on the young corn is said to brighten and strengthen the straw.

BOOKS: *R M.* "Blackie's Cyclopedia of Agriculture," "Stephens's Book of the Farm," "Low's Elements of Practical Agriculture," "Chambers's Work," by Jackson, are all good books.

CORN FOR SHEEP: *A B.* From half a pint to a pint of Barley or Peas a day, apiece, is a fair allowance; the smaller quantity for the smaller sheep. A lamb may consume in three months, after it begins to it, rather more than half a bushel. Your Grass will of course benefit by sheep being fed on the aftermath with artificial food, though whether the loss by an *annual* mowing of the Grass will not exceed this benefit, depends upon the number of sheep thus kept per acre, and the manuring thus given.

FENTON WHEAT. Our correspondent can be supplied with the true Fenton Barns Wheat, from seed obtained from Edinburgh last year, on application to the bailiff, at Chesterton Farm, near Cirencester.

GRASS UNDER TREES: *Diss.* You should not sow more of the nitrate at any time than 1 cwt. per acre. Do so twice in the year, after wet weather, between early spring and midsummer.

NAMES OF WHEAT: *Cambria.* No. 1, not known; No. 2 resembles the "Bristol red."

POTATOES: *F P D.* If they were ripe, or nearly so, when attacked, dig them now, while the land is dry.

POULTRY: *K C H.* It is not at all an unusual thing for a pullet to lay at 22 weeks, if she attain that age in the summer. In the winter she would probably be from a month to six weeks later. I have Cochin China pullets hatched on the 15th March, laying regularly. *J Baily, 113, Mount-street.*

SUMMER FEEDING: *W W.* asks, How many beasts per acre can be kept on old Grass land of medium quality by means of house feeding? [It depends altogether on the size of the Beasts and the quality of the land. The best land in the kingdom will feed one ox and one sheep per acre from May-day till Michaelmas; the former gaining 20 stones, and the latter 40 lbs.] Do milking cows thrive well when kept up all summer? Will beasts feed as fast on mown Grass as they would if grazing on the land which has produced it? Is it expedient to add cake, corn, or Linseed, and in what proportions? Is it practicable to keep a regular supply of Grass fit for mowing, say from May to October? Is the general result of house-feeding in summer on an exclusively Grass farm, such as to make it more expedient than the usual method of grazing out of doors? [Our own experience relates only to Clover and artificial Grasses, and so we publish these questions.]

TURNIPS: *W Bartlett.* They suffer from aubury or "fingers and toes." Lime is said to remove the tendency of soil to produce it.

WHITE MUSTARD: *Constant Subscriber.* The winter frosts will destroy it. Sow in May for your earliest crop.

## METEOROLOGICAL REPORT.—SEPTEMBER.

(*Continued from p. 574.*)

| Date. | Time. | Max. | Min. | Wind and Weather. |
|---|---|---|---|---|
| Sept. 3 | 11.15 a.m. | 30.05 | ... | Brisk NNE. breeze. Heavy thunder clouds to eastward in the afternoon. Fine pleasant day, and warm. |
| | 2.55 p.m. | ... | 30.03 | |
| 4 | 8 a m | 30.00 | ... | Brisk NNE. A.M.; P.M. and evening almost calm. Fine pleasant day, barometer steady, evening clear. |
| | 6.35 p.m. | ... | 29.99 | |
| 5 | 8 a.m. | ... | 30.04 | Brisk NNE. breeze. Fine pleasant day, overcast at times; barometer rising steadily. |
| | 11.25 p.m. | 30.12 | ... | |

# Markets.

## COVENT GARDEN, SEPT. 13.

Peaches and Nectarines are more plentiful; the best samples fetch 8s. and 10s. a dozen. Pines and Grapes are abundant. Morello Cherries are still furnished in small quantities. Greengage Plums are scarce, as are also Oranges and Lemons. Nuts remain nearly the same as quoted last week. Filberts are imported in quantity. Carrots, Turnips, Cabbages, &c., are sufficient for the demand. Potatoes are good in quality, and, remain tolerably free from disease. Lettuces and other salading are sufficient for the demand. Mushrooms (bushels) are beginning to appear. Cut flowers consist of Heaths, Pelargoniums, Mignonette, Heliotropes, Stephanotis, Moss and Provins Roses.

### FRUIT.

| | |
|---|---|
| Pine-apples, per lb., 3s to 6s | Apples, kitchen, p. bsh., 1s to 1s 6d |
| Grapes, hothouse, p. lb., 2s to 5s | Pears, dessert, p. doz., 2s to 5s |
| — Lisbon, per lb., 9d to 1s | Almonds, per peck, 6s |
| Peaches, per doz., 6s to 10s | — sweet, per lb., 2s to 3s |
| Nectarines, per doz., 6s to 10s | Lemons, per doz., 1s to 2s |
| Apricots, per doz., 4s to 6s | Oranges, per doz., 2s to 4s |
| Cherries, per lb., 6d to 2s | — per 100, 14s to 30s |
| Melons, each, 1s to 4s | Nuts, Barcelona, p. bsh, 20s to 22s |
| Currants, p. hf. sieve, 4s to 5s | — Brazil, p. bsh., 12s to 14s |
| Plums, per punnet, 1s to 2s | Filberts, per 100lbs., 55s to 70s |
| Figs, per doz., 1s 6d to 3s | Walnuts, per bush., 12s to 24s |

### VEGETABLES.

| | |
|---|---|
| Cabbages, per doz., 3d to 1s | Leeks, per bunch, 1d to 2d |
| Cauliflowers, p. doz., 6d to 3s | Shallots, per lb., 3d to 6d |
| French Beans, per half sieve, 1s to 2s | Garlic, per lb., 4d to 6d |
| Beans, per sieve, 1s 6d to 2s | Artichokes, per doz., 1s to 2s |
| Peas, per sieve, 1s 9d to 3s 6d | Lettuce, Cab., p. score, 4d to 1s |
| Potatoes, per ton, 45s to 80s | — Cos, per score, 3d to 1s |
| — per cwt., 2s to 5s | Small Salads, p. punn., 2d to 3d |
| — per bush., 1s 6d to 2s 6d | Horse Radish, p. bundl., 1s 6d to 6s |
| Turnips, p. bunch, 2d to 4d | Red Beet, per doz., 1s to 2s |
| Cucumbers, each, 1d to 1s | Mushrooms, p. pot., 1s to 1s 6d |
| Radishes, per doz., 6d to 9d | Sorrel, per hf. sieve, 6d to 9d |
| — Turnip, p. doz., 8d to 1s | Fennel, per bunch, 2d to 3d |
| Celery, p. bundle, 6d to 1s 6d | Savory, per bunch, 2d to 3d |
| Carrots, per bunch, 4d to 6d | Thyme, per bunch, 2d to 3d |
| Spinach, per sieve, 1s 6d to 2s | Parsley, per doz. bun., 2s to 3s |
| Vegetable Marrows, per doz., 6d to 1s | — Roots, p. bundl. 9d to 1s |
| Onions, p. bunch, 1d to 5d | Mint, per bunch, 1d to 2d |
| — Spanish, p. doz., 1s 6d to 3s | Basil, p. bunch, 3d to 4d |
| | Marjoram, do., 3d to 4d |
| | Watercress, p. 12 bunch., 4d to 6d |

## COAL MARKET.—FRIDAY, SEPT. 12.

Hollywell, 14s. 6d.; Wallsend Gasforth, 13s. 9d.; Wallsend Haswell, 15s. 3d.; Walls-end Hetton, 15s. 3d.; Wallsend Stewarts, 15s. 3d.—Ships at market, 23.

## HAY.—Per Load of 36 Trusses.

## HOPS.—FRIDAY, Sept. 12.

Messrs. Pattenden and Smith report that about 500 pockets of new Hops have arrived at market, but as yet not ripe enough to tempt consumers to purchase; in this state of things it is difficult to quote prices; a better supply is expected in another week or ten days; good yearlings are selling freely at better prices. Duty 110,000*l.* to 115,000*l.*

## SMITHFIELD, MONDAY, Sept. 8.

The supply of Beasts is very large, but we are not overdone with choice qualities; these, therefore, maintain their prices, and are readily sold. A considerable number of inferior kinds remain unsold. The number of Sheep and Lambs is but moderate; trade is cheerful, at fully late rates; indeed, a few of the choicest kinds make rather more money. Trade is dull for Calves at barely Friday's rates. From Holland and Germany there are 1350 Beasts, 5170 Sheep, 216 Calves, and 220 Pigs; from Scotland, 50 Beasts; and 2750 from the northern and midland counties.

| Per st. of 8 lbs.— | s | d | s | d | Per st. of 8 lbs.— | s | d | s | d |
|---|---|---|---|---|---|---|---|---|---|
| Best Scots, Herefords, &c. | 3 | 4 | to 3 | 6 | Best Long-wools | 3 | 6 | to 3 | 8 |
| Best Short-horns | 3 | 2 | — 3 | 4 | Ditto Shorn | ... | | ... | |
| 2d quality Beasts | 2 | 6 | — 3 | 0 | Ewes & 2d quality | 2 | 8 | — 3 | 4 |
| Best Downs and Half-breds | 3 | 8 | — 4 | 0 | Ditto Shorn | ... | | ... | |
| Ditto Shorn | ... | | ... | | Lambs | ... | 4 | 4 — 4 | 8 |
| | | | | | Calves | ... | 2 | 6 — 3 | 8 |
| | | | | | Pigs | ... | 2 | 8 — 3 | 8 |

Beasts, 4650; Sheep and Lambs, 31,270; Calves, 305; Pigs, 590.

FRIDAY, Sept. 12.

The number of Beasts is large, but the majority is of very inferior quality; consequently, choice ones are as dear as on Monday. Trade is remarkably dull for all other kinds. Good Sheep are not very plentiful; trade is brisk for them at fully Monday's quotations. We have now but a small demand for Lamb, the season being nearly over. Good Calves maintain their price; middling ones are very unsaleable. From Germany and Holland we have 740 Beasts, 2890 Sheep, 380 Calves, and 60 Pigs; from Spain, 59 Beasts; from Scotland, 30; 250 from the northern and midland, and 98 milch cows from the home counties.

| Best Scots, Herefords, &c. | 3 | 4 | to 3 | 6 | Best Long-wools | 3 | 6 | — 3 | 8 |
|---|---|---|---|---|---|---|---|---|---|
| Best Short-horns | 3 | 0 | — 3 | 4 | Ditto Shorn | ... | | ... | |
| 2d quality Beasts | 2 | 4 | — 2 | 8 | Ewes & 2d quality | 2 | 10 | — 3 | 4 |
| Best Downs and Half-breds | 3 | 10 | — 4 | 0 | Ditto Shorn | ... | | ... | |
| Ditto Shorn | ... | | ... | | Lambs | ... | 4 | 0 — 4 | 8 |
| | | | | | Calves | ... | 2 | 6 — 3 | 8 |
| | | | | | Pigs | ... | 3 | 4 — 4 | 0 |

Beasts, 1283; Sheep and Lambs, 11,450; Calves, 624; Pigs, 510.

## MARK LANE.

MONDAY, SEPT. 8.—There was a good supply of Wheat by land carriage samples from Essex and Kent this morning, which was freely taken by millers at the terms of this day se'nnight. Foreign met a very limited demand, and its value must be considered nominally the same as last week.—Barley and English Beans and Peas are a ready sale at last week's prices.—The Oat trade is heavy, particularly for Russian, and Monday's quotations cannot be exceeded.—We observe no alteration in the value of Flour, the inquiry is confined to retail buyers.

| Per Imperial Quarter. | s. | s. | | s. | s. |

| — Foreign .....per barrel | 18 | —22 | Per sack | 27 | —33 |

FRIDAY, SEPT. 12.—The arrivals of grain and Flour this week have been moderate. The attendance at market this morning is small, and business in all articles limited. New English Wheat is in request at Monday's prices, but foreign is neglected.—Barley is in fair demand at late rates.—In Beans and Peas there is little doing, but prices are unaltered.—Oats meet a tolerably good inquiry at our late quotations.—Flour is less sought after than it has been during the week.—Floating cargoes of Polish Odessa are offered at 31s. per qr. without finding buyers. Galatz Maize is in demand at 26s. per qr., both f. o. b., including freight and insurance.

LIVERPOOL, TUESDAY, SEPT. 9.—There was a full attendance of millers and dealers at our market this morning, some of whom were from a distance in the interior, induced to visit us by our low rates for Wheat and Flour. Both of these articles were in good healthy demand, at full and extreme prices. New Oats are still scarce, and quite as dear as last week; indeed, there was little or no alteration in the general quotations of Tuesday last, and a firmer feeling seemed to pervade the trade generally. There was a middling supply of new Wheat from the neighbouring farmers, and it sold readily at 5s. 9d. to 6s. per 70 lbs. for red and white.—FRIDAY, SEPT. 5.—The arrivals coastwise and from Ireland since Monday last are trivial, and those from abroad very moderate, except Flour, comprising 12,946 barrels. At our market to-day operations in American Flour were to a fair extent, at a decline of 6d. per barrel from Tuesday's rates. French Flour remained steady in value. Old Wheats, both English and foreign, continued in limited demand, and prices the turn lower. Of new Wheat, good qualities were readily sold at 5s. 6d to 6s. 1d. per 70 lbs. Barley, Malt, Beans, and Peas met with a slow limited sale at late rates. Oats and Oatmeal maintained Tuesday's prices. Indian Corn, both on the spot and afloat, was held at late rates.

GLASS. GLASS.

## HARTLEY'S PATENT ROUGH PLATE GLASS, FOR RIDGE AND FURROW ROOFS, GREENHOUSES, RAILWAY STATIONS, ENGINE SHEDS, MILLS, MARKET-HALLS, AND PUBLIC BUILDINGS GENERALLY.

For Conservatories, Public Buildings, Manufactories, Skylights, &c. &c.

| | ⅛'th inch thick. | 3-16'th inch thick. | ¼ inch thick. |

| 12 " " 15 " " 70 " 85 " ... ... ... ... | ..... | 1 0 | 1 2 |

*Packed in boxes of 50 feet each.*

6 by 4 in. and 6½ by 4½ in., 12*s.* per box; 7 by 5 in. and 7½ by 5½ in. 13*s.* 6*d.* do.; 8 by 6 in. and 8½ by 6½ in. 15*s.* do.; 9 by 7 in., 9½ by 7½ in., and 10 by 8 in., 16*s.* 6*d.*

*N.B.—The Patent Rough Plate, one-eighth of an inch thick, is supplied in quantities* 62 *by* 18 *inches, for* 10 *feet span ridge and furrow roofs, at a reduced price.*

NOTE.—Squares are charged according to the superficial contents, except where the length exceeds the restriction above, in which case the higher price is charged irrespective of the contents.

*Bending.*—1-8*th*, 6*d.*; 3-16*ths*, 9*d.*; ¼ *inch*, 1*s. per foot, net.*

*Irregular shapes are charged as squares.*

*When Crates are ordered, the* 30*-inch widths will be sent, unless otherwise specified.*

THE PATENT ROUGH PLATE, one-eighth of an inch thick, and weighing 2 lbs. to the foot, has now become an article of very extensive and increasing consumption.

*It is universally admitted to be the best and most suitable Glass for Ridge and Furrow Roofs, Greenhouses, Factories, Workshops,*

And all such like purposes, and is a cheap and efficient substitute for Fluted or Obscured Glass, where the object is to intercept the vision without diminishing the light. Its non-transparency, strength, and cost (being no more weight for weight than Common Sheet Glass), render it eminently suitable for the Glazing of Conservatories and Roofs of all kinds; Blinds are unnecessary, and when used in Greenhouses *no scorching occurs.*

Where still greater strength is required the 3-16ths and ¼ inch thick will be found much cheaper than the Common Rough Plate. Samples will be forwarded on application, by applying to JAMES PHILLIPS & CO., HORTICULTURAL GLASS MERCHANTS, 116, BISHOPSGATE-STREET WITHOUT, LONDON.

### GLASS FOR CONSERVATORIES, &c.

HETLEY AND Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 35, Soho-square, London.

See the *Gardeners' Chronicle* first Saturday in each month.

### GLASS.

THOMAS MILLINGTON'S FOREIGN SHEET GLASS is far superior to any other manufacture, as well as cheaper. In 100 feet boxes packed for immediate delivery.

| | | | |
|---|---|---|---|
| 6 inches by 4 and 6½ by 4½ ... ... ... | 13*s.* | 0*d.* |
| 7 " 5 and 7½ by 5½ ... ... ... | 15 | 0 |
| 8 " 5 and 8 by 5½ ... ... ... | 15 | 0 |
| 8 " 6 and 8½ by 6½ ... ... ... | 17 | 6 |
| 9 " 7 and 10 by 8 ... ... ... | 20 | 0 |
| 12 " 10 and 13 by 9 ... ... ... | 20 | 0 |

And many other sizes, or cut to order in various thicknesses. Cases containing large Sheets, in 100, 200, and 300 feet, at 21*s.* per 100 feet.

ROUGH PLATE, perfectly flat, ⅛ in. thick, best manufactured.

| | | |
|---|---|---|
| In sizes under 15 inches ..... | 6*d.* | per foot. |
| " " 35 " ..... | 8*d.* | " |
| " " 50 " ..... | 9½*d.* | " |
| " " 75 " ..... | 12*d.* | " |

Milk Pans, 2*s.* to 6*s.* each; Metal Hand-frames, Glass Tiles and Slates; Cucumber, Propagating, and Bee Glasses; Wasp Traps, Glass Shades, and Plate Glass, at 87, Bishopsgate-street Without, same side as Eastern Counties Railway.—Established 100 years.

### GLASS WATER PIPES.

MESSRS. COATHUPE AND CO., CROWN and SHEET GLASS MANUFACTURERS, Nailsea, near Bristol, Somerset, beg to inform Engineers and others that they are supplying GLASS PIPES, with their Joints, from 1 to 4 inches bore, capable of bearing very great atmospheric pressure, in lengths from 3 to 7 feet, the lengths being less as the diameter of the bores increase. These Pipes may be seen at the Exhibition (Class 24, Section 47), with their forms and modes of joining, in the Section allotted to the Glass Manufactures; and references can be given of their great utility in numerous localities, where they have been successfully employed. The great advantage of Glass Pipes for the conveyance of pure water over all metallic substances, has been too largely dwelt upon by medical and scientific authorities to require any further comment.

Nailsea Glass Works, near Bristol.

GREAT EXHIBITION.—New system of GLAZING GREENHOUSES, &c., without the use of putty or other adhesive compost, by ALFRED KENT, Chichester, as shown in a Model at the West End of the Building, outside. The above invention has attracted universal notice amongst Horticulturists and others, and has maintained, under the scrutiny of the public eye, its pretensions to overcome the great evil of all other cheap systems of Glazing, viz., leakage.

A. KENT having made great improvements in manufacturing the parts required in this invention, can now offer his new system at a less cost than as before advertised :—

2½-inch Greenhouse Lights, complete, at 1*s.* 0*d.* per ft., superficial.
2-inch, at ... ... ... ... ... ... 0 10 " " "
1½-inch, at ... ... ... ... ... ... 0 8 " " "

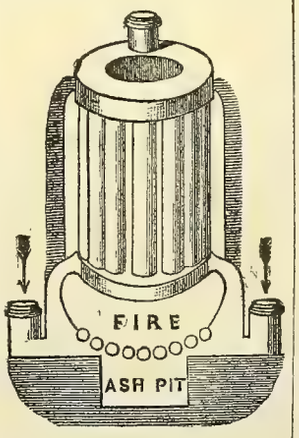
Can be packed securely, and sent to any part of the country.

The saving of repairs effected by this system, over all others, being of paramount importance, A. KENT is willing to reply to any communication (post paid), explaining how such a saving is effected. Estimates given for the entire erection of Greenhouses in any part.

The Inventor is open to co-operate with any extensive Horticultural Builder in London, to Manufacture and carry on the Patent, or to dispose of the Invention entire.

### VINAIGRE DE BORDEAUX.

PURE WINE VINEGAR (preferable to any other) of the finest quality, highest strength, well matured, and in colour and brilliancy like the wine from which it is made.—Sold by Chemists, Grocers, and Wine Merchants throughout the kingdom, whose names may be learnt on application to the importers, W. and S. KENT and SONS, Upton-on-Severn.



N.B.—Export orders from Bonded Warehouses ex duty. Stores in London, Liverpool, and Hull.

### CONSERVATORY.

WANTED, to PURCHASE, a good CONSERVATORY, or GREENHOUSE, either with or without the Plants.—Address, stating dimensions and other particulars, to Y. Z., care of Messrs. Wilson, Wholesale Stationers, 103, Cheapside, London.

TO BE SOLD, a GREENHOUSE, with Burbidge and Healey's Hot-Water Apparatus complete, with a quantity of Slate Shelves, and a Flower Stage in the centre, made of the best materials. The House is one of the best and most complete that can be made, being 25 feet long and 14 feet wide, with thick sheet glass, and large squares. It is nearly new, and to be sold for merely its value (cost price); price 100*l.* complete. To be seen at 19, Tollington Park, Hornsey Road, near London. The collection of Plants, Camellias, Azaleas, and Geraniums, to be sold with or without the Greenhouse.

### HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

J. WEEKS AND Co., King's-road, Chelsea, HORTICULTURAL ARCHITECTS, ENGINEERS, and BUILDERS. These Boilers are very powerful, durable, and economical. The fire warranted to last 15 hours without attention. The Furnace Bars are Hollow Tubes, through which the return water passes before entering the upper part of the Boiler, thereby causing a very rapid circulation, and producing double the effect from the same quantity of fuel.

J. WEEKS and Co., King's-road, Chelsea, CHALLENGE the whole world to make a Boiler that will produce anything like the same effect, with the same quantity of Fuel, in a given time. It is one of these Boilers that warms the water of their VICTORIA REGIA Tank, which contains 9000 gallons, and also heats several large Forcing-houses and ranges of Pits, with a small consumption of fuel.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

### THE ROYAL EXHIBITION.
### FLOWER-POTS! FLOWER-POTS!! FLOWER-POTS!!!

CHARLES PHILLIPS, POTTER, of Weston-Super-Mare, having been requested by the principal Nurserymen of England to publish a complete LIST of the clear inside diameter of all Pots manufactured by him, begs leave to subjoin the following :—

| No. | Size. | No. | Size. | No. | Size. | No. | Size. |
|---|---|---|---|---|---|---|---|
| 1 | 1½ in. | 6 | 4½ in. | 11 | 8½ in. | 16 | 15 in. |
| 2 | 2½ " | 7 | 5½ " | 12 | 9½ " | 17 | 16 " |
| 3 | 2½ " | 8 | 6½ " | 13 | 11 " | 18 | 18 " |
| 4 | 3½ " | 9 | 7 " | 14 | 12½ " | 19 | 20 " |
| 5 | 4 " | 10 | 8 " | 15 | 14 " | 20 | 22 " |

Saucers and Seed Basins the same width as the Pots.

Persons visiting the Royal Exhibition can inspect CHARLES PHILLIPS's Pottery, &c., in the Model Greenhouse, situate at the West Entrance of the Crystal Palace. C. P. deems it superfluous to laud either the quality of his Clay, or the style in which his goods are manufactured, but confidently refers those parties who have not yet patronised him to the Royal Gardens at Frogmore and Kew, and to the principal Nurserymen in London, Slough, Reading, Oxford, Swindon, Cirencester, Stroud, Worcester, Gloucester, Cheltenham, Bath, Bristol, Taunton, Tiverton, Exeter, Torquay, Totnes, Plymouth, North and South Wales, &c., &c., for the quality of the articles which he has had the honour of supplying them with. All orders for the above Goods will be promptly forwarded, CARRIAGE FREE, to any Railway Station within 150 miles of the Manufactory, either in dozens, casts, hundreds, or thousands. Every description of Red Ware, Sewerage, Piping, Closet-Pans, Chimney-Pots, Land Drain Pipes, Seakale Pots, Vases, Tiles, Bricks, &c.

Lists of Prices, Terms, &c., forwarded to any address.

Manufactory, Locking Road, Weston-Super-Mare, Somerset.

ESTABLISHED 1836.

### CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL AND Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

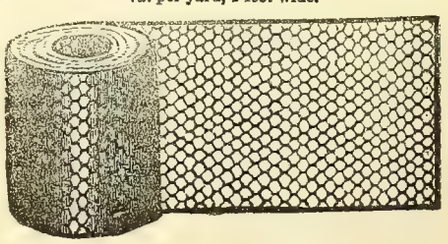
And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are F. M'NEILL AND CO.'S



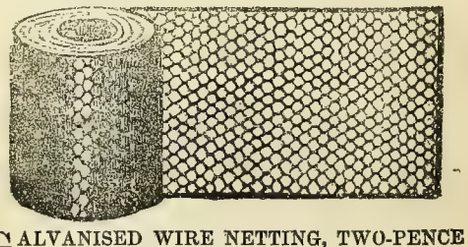
Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where Roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance of Westminster Hall, were roofed with F. M'NEILL and Co's Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

### GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.



| | | Galvanised. | Japanned, Iron. |
|---|---|---|---|
| 2-inch mesh, light, 24 inches wide ... | 7*d.* per yd. | 5*d.* per yd. |
| 2-inch " strong " ... | 9 " | 6½ " |
| 2-inch " extra strong " ... | 12 " | 9 " |
| 1⅝-inch " light " ... | 8 " | 6 " |
| 1⅝-inch " strong " ... | 10 " | 8 " |
| 1⅝-inch " extra strong " ... | 14 " | 11 " |

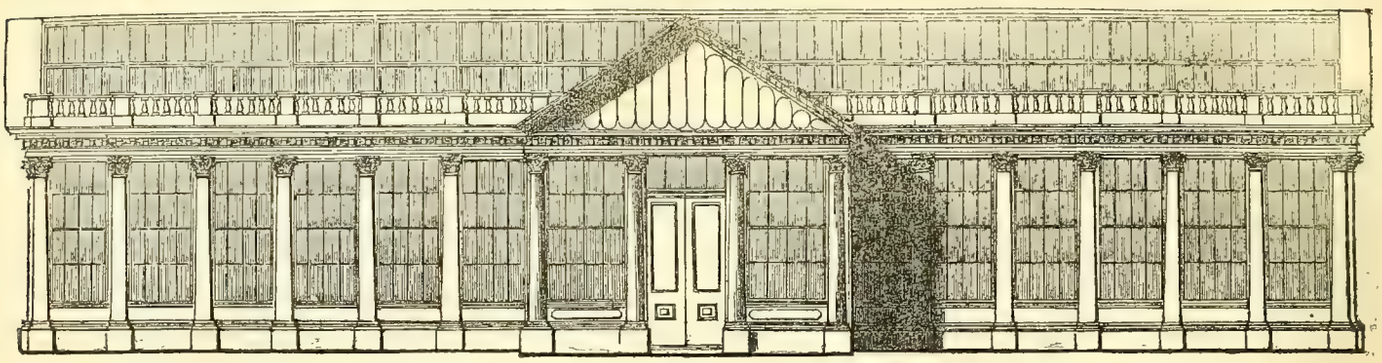
All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised sparrow-proof netting for Pheasantries, 3*d.* per square foot. Patterns forwarded post free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

### WIRE NETTING ONE PENNY PER SQUARE FOOT.

GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

| | | | |
|---|---|---|---|
| 12 inches wide | 3*d.* | per yard. | 30 inches wide 7½*d.* per yard. |
| 18 " " | 4½*d.* | " | 36 " " 9*d.* " |
| 14 " " | 6*d.* | " | 48 " " 1*s.* " |



Galvanised do., 1*d.* per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1*s.* 6*d.* per running yard; if galvanised, 2*s.* Also every description of Wire Nursery and Fireguards. Wire House-lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1*s.* 10*d.* per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6*d.* per running foot; Flower Trainers, from 3*d.* each; Garden Arches, 20*s.* each. Flower Stands, from 3*s.* 9*d.* each; Galvanised Tying Wire for Plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 44, Skinner-street, Snow-hill, London.

"KNOW THYSELF."—Professor ELLISON continues to give his very peculiar and interesting delineation of the character and qualifications of individuals, discoverable from their handwriting, which have given so much astonishment, instruction, and delight. The mental and moral qualities of yourself or of others in whom you may be interested will be minutely and interestingly described, on receipt of any specimen of writing, enclosing fourteen postage-stamps, and a mention of writer's age, addressed to Mr. E. ELLISON, 151, Strand, London.

# HORTICULTURAL BUILDING AND HEATING BY HOT WATER,

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.

## GRAY AND ORMSON, DANVERS STREET, CHELSEA, LONDON,

Having had considerable experience in the construction of Horticultural Erections, which for elegance of design, good materials and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are now in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-Water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot-Water can be made available.

## *SALES BY AUCTION.*

CAMELLIAS FROM BELGIUM.

MR. J. C. STEVENS will sell by Auction, at his Great Room, 38, King-street, Covent-Garden, on MONDAY, September 22, at 12 for 1 o'clock, 1000 CAMELLIAS, from 1 to 4 feet, well set with bloom, consisting of the best varieties, such as Double White, Donckelaari, Fimbriata, Imbricata, &c, also a few plants of Mathotiana, the largest and best red known, and a few of the Marchioness of Exeter. May be viewed on the morning of sale, and Catalogues had of Mr. J. C. STEVENS, 38, King-street, Covent-Garden.

AN IMPORTATION OF PLANTS FROM WESTERN AFRICA.

MR. J. C. STEVENS will sell by Auction, at his Great Room, 38, King-street, Covent-Garden, on MONDAY, September 22, at 2 o'clock precisely, 12 Glazed Cases of Orchids, Aquatics, Flowering Shrubs, Fruits, and other Plants, collected in Western Africa, by THOMAS WHITFIELD, Esq., by whom they have just been brought over in good health; dried specimens and drawings of many of them will be exhibited at the Sale; they may be viewed on Saturday before the Sale, and Catalogues had.

TO ZOOLOGISTS.—KNOWSLEY PARK, NEAR LIVERPOOL.—NOTICE OF SALE, BY AUCTION, OF THE RENOWNED MENAGERIE AND AVIARY, FORMED BY THE LATE RIGHT HON. THE EARL OF DERBY, K.G., PRESIDENT OF THE ZOOLOGICAL SOCIETY OF LONDON.

MR. J. C. STEVENS is honoured with instructions from the Executors of the late Noble Earl, to sell by public Auction, on the premises, Knowsley, 6 miles from Liverpool, on MONDAY, October 6, and many following days, the whole of the LIVE ANIMALS AND BIRDS contained in the KNOWSLEY MENAGERIE, excepting only the five Eland Antelopes, selected by the Zoological Society of London, and one specimen, or series, to be selected by her Majesty, in pursuance of a desire expressed by the late Earl. This collection is admitted by Zoologists to be the finest extant, it numbers upwards of 1600 examples, including an unique collection of the rarest Antelopes, Deer, Indian Cattle, Zebras, Llamas, Alpacas, &c., which are particularly deserving the attention of Noblemen and Gentlemen, as ornamental specimens for the Park.—May be viewed, by Catalogues (price 5*s.* each), to admit one person, only, to the view, on Monday, the 29th inst., or either of the five following days; these may be had by persons intending to purchase, at the Office, Knowsley Hall; and of Mr. J. C. STEVENS, 38, King-street, Covent-garden London.

CHELSEA.

IMPORTANT FINAL SALES, IN CONSEQUENCE OF THE EXPIRATION OF THE LEASE.

TO GENTLEMEN, NURSERYMEN, AND OTHERS.

MR. D. A. RAMSAY has received instructions from Messrs. Dennis and Co. to submit to public competition, on the premises, opposite Cremorne Gardens, King's-road, Chelsea on TUESDAY, September 23, and following day, at 1 o'clock, all that very valuable and extensive stock of GLASS, comprising the erections of Greenhouses and Pits, fitted up with Stages and all necessary Heating Apparatus, Garden Frames, Lights, Sheds, &c.; also the justly celebrated collection of Greenhouse Plants, consisting of Geraniums of the most choice varieties, Azalea, Camellia, Aloes, Cacti, large specimen Yuccas, &c., forming a collection rarely to be met with, including large Scarlet Rhododendrons, Evergreens of sorts, Roses in great variety, Jasmine, Ivies, and other Climbers, in pots. The stock of this old-established Nursery needs no further recommendation than the name; and Mr. D. A. RAMSAY, in calling the attention of the public to this and the following Sales, has only to observe, that in consequence of the Lease expiring at Christmas next, and the ground being required for building purposes, the Stock must be positively sold without reserve. The other Sales will take place in October and November, comprising the remaining Nursery Stock, including the largest and finest collection of Mulberry Trees in the country, choice Gooseberries, Evergreens, and other Miscellaneous Stock, of which due notice will be given.—May be viewed prior to Sale, and Catalogues had, on the premises, at the principal Seed Shops, and of the Auctioneer, Brompton Nursery, Fulham-road, Brompton.

PARADISE NURSERY, HORNSEY-ROAD, ISLINGTON.

THIS Desirable NURSERY TO BE LET, or the LEASE TO BE SOLD, in consequence of the Proprietor being about to retire from the Nursery Business. With immediate occupation. The whole may be taken at a valuation, or by private contract.—Apply personally, or by letter, to W. J. PAMPLIN, on the premises.

TO BE LET, a Farm, in the county of Wilts.—The Farm comprises a commodious Dwelling-house, extensive Outbuildings, and about 314 acres of Land, for the most part of superior quality, of which about 205 acres are Meadow and Pasture, and 109 Arable. The estate is undergoing thorough drainage. The Farm will be let from Michaelmas next on lease, if desired, for 14 or 21 years.—For further particulars, and to treat for a lease, apply to Messrs. LAWRENCE, Cirencester.

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

ELIGIBLE FARM TO LET IN GLAMORGANSHIRE.

TO BE LET, on lease, or yearly tenancy, Lanfa Farm, situated about 3 miles from Bridgend, comprising 410 acres of excellent Meadow, Pasture, and Arable Land. The Farm is now in the occupation of the Proprietor, and is in a good state of cultivation. The extent may be considerably increased, if desired, by the addition of adjoining land. Nearly 70 acres of old Meadow Land have lately been brought into cultivation. Bridgend, from its contiguity to the mineral district, has a good market weekly, for the sale of all descriptions of agricultural produce.—For further particulars apply to Mr. EVAN W. DAVID Radyr-court, Cardiff.

TO FARMERS, MARKET GARDENERS, AND OTHERS.

TO BE LET, close to the Town of Cheltenham, and may be entered upon immediately, 18 Acres of ARABLE LAND, and 15 Acres of PASTURE LAND, with House, Barn, Stables, Cowhouse, and other Buildings.—For particulars, inquire of Mr. DAVIS, Corn Dealer, Winchcomb-street, Cheltenham.

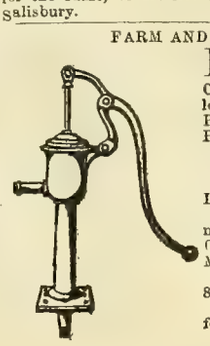
TO FLORISTS AND OTHERS.

AN OPPORTUNITY RARELY TO BE MET WITH.

TO BE LET, with immediate possession, an old established FLORIST GROUNDS, with Greenhouses, and every convenience for carrying on an extensive business; the valuable Stock to be Sold, comprising many new Seedling Flowers never yet sent out, viz. variegated scarlet Geraniums, Mimuli, Fuchsias, &c. Coming in, including Stock, 150*l.*—Apply to Mr. L. JOHNSTON, Auctioneer, King-street, Hammersmith, near London.

TO SEEDSMEN AND OTHERS.

TO BE SOLD, by Private Bargain, the whole STOCK IN TRADE, SHOP FITTINGS, and GOODWILL of the BUSINESS belonging to the Sequestered Estate of OLIVER BROTHERS, Seedsmen, Falkirk. The Stock is well selected, and the Shop Fittings are remarkably handsome. The situation for a Seed Business is one of the best in Scotland, the premises commodious, and to a practical and experienced party such an opening is rarely to be met with. Credit for the price on approved bills may be had. An Inventory of the Stock may be seen either with Mr. A. B. WRIGHT, Seedsmen, Edinburgh, the Trustee for the Estate; or Messrs. RUSSEL and AITKIN, Writers, Falkirk, who will inform as to particulars, and with either of whom offers may be lodged to the 1st proximo inclusive.—Falkirk, Sept. 13.



HAMPSHIRE.

EXCELLENT RESIDENCE IN A HUNTING COUNTRY, WITH OR WITHOUT A GOOD FARM.

TO BE LET, with immediate possession, all that capital and highly-desirable RESIDENCE, known as "MARWELL LODGE" (recently put into substantial repair), with a Lawn, walled-in Garden, and about 35 acres of good productive Land, immediately surrounding the House. And also, if required, all that FARM, called "MARWELL FARM," comprising a Farm House, two good Homesteads, and sundry Cottages; and about 420 acres of Land, whereof 360 acres are Arable, 37 acres Meadow and Pasture, and 23 acres Wood Land. Marwell Lodge is pleasantly situate near to Owslebury, four miles distant from the Bishopstoke Station on the South-Western Railway, six miles from Botley, and six from Winchester, and within easy reach of three packs of Foxhounds.

To view the Property, apply at Marwell Hall, and to treat for the same, to Messrs. ATTWOOD and RIGDEN, the Close, Salisbury.

FARM AND COTTAGE PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

| | |
|---|---|
| Patent Pump ... ... | £1 16 0 |
| Patent Pump, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing ... ... ... | 2 12 0 |

Larger sizes if required.

May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers.

JOHN WARNER & SONS,
8, Crescent, Jewin-street, London.

Every description of Machinery for Raising Water, Fire Engines, &c. The usual allowance to the Trade.

M'CORMICK'S PATENT AMERICAN REAPER.—Great Medal, Exhibition, 1851; Gold Medal of the American Institute, 1849; Certified Diploma of the same Institute, 1850; also, on Wednesday last, it obtained the First Premium of the Royal North Lancashire Agricultural Society, 1800 sold last year in America. This Machine will be shown in operation at Carlisle on the 17th and 18th inst.; at the Cleveland Society's Meeting, Middlesborough, near Stockton-on-Tees, on the 25th; and various other places, of which notice will be given.—BURGESS and KEY, Sole Agents to the Proprietor, 103, Newgate-street, London; B. SAMUELSON, Banbury, Sole Maker.

To insure delivery for next season, orders are requested before the 31st of December.

NEW WORK ON THE BREEDING OF HORSES.

Just published, in One Volume, fcap. 8vo, with Frontispiece; uniform with "Harry Hieover's Hunting-Field," &c., price 5*s.*, half-bound,

Now ready, complete in two vols., cloth, price 3*s.* each; or in 10 Parts, price 6*d.* each.

VOL. II. HUNT'S HANDBOOK TO THE EXHIBITION OFFICIAL CATALOGUES: an Explanatory Guide to the Natural Productions and Manufactures of the Great Exhibition of the Industry of all Nations, 1851. Edited by ROBERT HUNT, Keeper of Mining Records. This work is so arranged that every visitor will be enabled at once to find the article described, and to obtain a correct account of its characteristics.

"The amount of scientific knowledge here compressed into two small volumes is astonishing; and this knowledge is not of an encyclopædian character, such as might be easily compiled from books, but fresh and recent on all subjects, more especially in the departments of science. The most instructive guide to the Exhibition while it is open—we have no doubt that this Hand-Book will become hereafter one of the most popular mementoes and histories of the actual gathering of the nations."—*Athenæum.*

"Useful in the Exhibition, and agreeable afterwards as a reminiscence of what was seen in the Great Year of 1851."—*Spectator.*

SPICER BROTHERS, Wholesale Stationers.
WM. CLOWES and SONS, Printers.

29, New Bridge-street, Blackfriars, at Hyde Park, of all Booksellers, in Town and Country, and at the Railway Stations.

Knowsthorpe, near Leeds, Yorkshire. Sept. 20.

JUDSON'S RICHMOND VILLA BLACK HAMBURGH VINE.
JOHN ANDREW HENDERSON AND CO. have the pleasure of informing their patrons and friends that they are now sending out this very excellent new Grape at 21*s.* each.
Its distinguishing characteristics are as follows:—The foliage is more deeply serrated, and the wood shorter jointed than the Black Hamburgh; the berries are oval, and rather elongated, and are remarkable for a very fine bloom, not unlike that of an Orlean Plum; when fully ripe are a fine deep black, having a fine rich flavour, and very juicy.
It colours full ten days earlier than the Black Hamburgh; being a most abundant bearer, and good setter, will prove a most desirable kind for pot-culture. One very remarkable property this Grape possesses, which much enhances its value, and makes it so superior to the Black Hamburgh is, that it never produces abortive, or, as they are termed, vinegar berries; after careful observation, extending over three successive seasons, not one could be detected, although in each season the crop was abundant and good. The usual allowance to the Trade.—Pine Apple Place, Edgeware Road, London.

RENDLE'S LIST OF NEW GERANIUMS will be found in the columns of this Paper, page 578, in the Number for September 13, 1851.
WILLIAM E. RENDLE, Florist to her Majesty, Plymouth.

SUTTON'S DESCRIPTIVE PRICED CATALOGUE OF HYACINTHS AND OTHER BULBOUS FLOWER ROOTS is just published, and will be forwarded, post paid, on receipt of two penny postage stamps.
Best HYACINTHS, by name, 6*s.* to 9*s.* per dozen,
Ditto mixed 3*s.* per dozen.
A first-rate collection of Fruit Trees will be seen in Messrs. SUTTON'S Nurseries, as also choice Coniferæ, and the best of the Perpetual Roses.
Reading Nurseries, Reading, Berks, Sept. 20.

NEW AND FIRST-RATE PELARGONIUMS.
J. DOBSON, FLORIST and SEEDSMAN (late Gardener to Mr. E. BECK, of Worton Cottage, Isleworth), begs to inform his friends and the public that he is now settled on his own ground at Woodlands, Isleworth, and has great confidence in recommending the following new and first-rate varieties of PELARGONIUMS, raised at Worton Cottage, Seedlings of 1850, which will be sent out on the 1st of October, packed in the manner that has given so much satisfaction. Package and Carriage Free to London. The Plants are well established in 4 inch pots, and J. D. feels assured that they will give the greatest satisfaction. Early orders to insure the first selections.
AMBASSADOR.—A large good-shaped flower; lower petals lilac, with a dark blotch on upper petals, leaving a narrow margin. Free bloomer and good habit. 1*l.* 1*s.*
ARETHUSA.—Lower petals delicate salmon, with a crimson blotch on the upper petals, shading off with deep rose. Good habit, and very free bloomer; will prove a first-rate variety for all purposes. 1*l.* 1*s.*
CAPELLA.—A flower of good form; lower petals rosy purple, with a white eye; the upper have a tinge of brown in the blotch, which gives it great richness. Good habit and very free bloomer. 15*s.*
COMMISSIONER.—Upper petals a dark chocolate colour, leaving a narrow margin of rose; lower petals a light purple, with dark veins, leaving a white eye. Good habit and excellent bloomer. 1*l.* 1*s.*
EXHIBITOR.—A large flat-sitting flower, deep crimson maroon blotch, leaving a narrow margin of deep rose; lower petals the same colour, with a white eye. Stout habit and free bloomer. 1*l.* 1*s.*
GEM.—A flower of good form; lower petals violet-crimson, with a small black blotch on the upper petals shaded off with orange. Free bloomer and constant; weak habit, 1*l.* 1*s.*
INCOMPARABLE.—Rightly named for its colour, for it has no equal. A good-sized, well-formed flower, of the deepest orange scarlet; the upper petals have a dark blotch veining off towards the edge. Good habit; not a free bloomer. 1*l.* 1*s.* No discount on this variety unless three are taken.
LEADER.—A crimson-purple flower, with dark blotch. Free bloomer and good habit. 15*s.*
PAINTER IMPROVED.—A great improvement on Painter; a novel and striking flower. Free bloomer; excellent habit. 1*l.* 1*s.*

VARIETIES OF 1849.

ROSA.—A bright rose-coloured flower, of great smoothness, and good form; a free bloomer, constant, and of excellent habit. Will prove a first-rate variety for all purposes. 1*l.* 1*s.*
MAJOR DOMO.—A very large rose-coloured flower, with dark clouded top petals; some of the blooms measured 3 inches in circumference. Free bloomer, and of strong habit. 10*s.* 6*d.*
SILK MERCER.—A very close compact-growing variety; free bloomer, and very constant; smooth silky flower, of first-rate quality; ground-colour rose, with deep maroon blotch on the upper petals. 10*s.* 6*d.*
PRINCE ARTHUR.—A medium sized flower, of excellent quality; very constant, and a free bloomer; rosy-crimson ground-colour, with dark well-defined blotch on the upper petals, leaving a bright distinct margin; light centre. 10*s.* 6*d.*
DIANA.—This is very similar to Rosalind, but larger, and is at its best early in the season, whilst the latter variety is not at its best until quite late. 7*s.* 6*d.*
TYRIAN QUEEN.—If the large deep mulberry-coloured top petals of the flower had been matched with as good lower ones, it would have been first-rate; strong robust habit, and a free bloomer. A very distinct and constant variety. 5*s.*

NOW READY, AND SENDING OUT.

The following selection needs no recommendation, as the flowers have been seen in nearly all the winning stands. Twelve of the following first-rate show varieties for 2*l.* 2*s.*, well established in 3 inch pots, and requiring an immediate shift. Package and Carriage to London included in the price.
*Chloe, *Constancy, Constance, Cuyp, Dorcas, Emily, Field Marshal, Governor, Loveliness, Magnificent, Painter, *Purpurea, Pet, Rosalind, Ruby, and Sarah.
N.B. The varieties marked thus * have not been sent out before, but will prove very desirable for all purposes.
Twelve of the following good and distinct varieties for 1*l.* 1*s.*, package and carriage to London included in the price. The plants are well established in 3 inch pots, and are now sending out. Blanche, Cassandra, Centurion, Crusader, Delicatissima, Emilia, Gulielma, Gustavus, Lalla Rookh, Mont Blanc, Ondine, Rosamond, Alonzo, and Star.

STORY'S NEW SEEDLING FUCHSIAS.

J. D. has also much pleasure in saying that he is in possession of the entire stock of those superb Seedling Fuchsias of 1850, raised by W. H. Story, Esq., of Whitehill, Newton Bushel. They are all quite distinct, and will be found a great acquisition. Mr. Story's well-known character as a successful raiser of Seedlings will be a sufficient guarantee that the flowers are first-rate; a full description of them will shortly be given. Strong plants will be ready early in spring.

| | |
|---|---|
| PECULIARITY | AGNES |
| FANTOME | AURORA. |

Also, a choice collection of Verbenas, Chrysanthemums, Pinks, Cinerarias, Phloxes, Hollyhocks, and all other Florist Flowers. J. D.'s Descriptive Catalogue of Pelargoniums, with other raisers' flowers, may be had by enclosing one postage stamp.—Garden Seeds, Bulbs, Mats, &c.
Woodlands Nursery, adjoining the Railway Station, Isleworth, Middlesex.

*All Orders above* 2*l. will be delivered Carriage Free to any Station on the Great Western, Bristol, Exeter, or South Devon Railway, or to Cork, Dublin, or Belfast. All Orders attended to in strict rotation.*
*A large Collection of BULBS has just arrived from Holland, which will be offered at very reduced prices.—Catalogues on application.*
Apply to WILLIAM E. RENDLE, Union Road, Plymouth, adjoining the Terminus of the South Devon Railway.

ROSES.—THE DESCRIPTIVE CATALOGUE OF ROSES for the present autumn, by THOMAS RIVERS, is now ready for delivery. It contains a selection only of the choicest Roses, both old and new. Some of the most eligible varieties for beginners are pointed out. Sent free for two postage stamps.
Nurseries, Sawbridgeworth, Herts.

A. PAUL AND SON'S CATALOGUE of ROSES for the present season, containing all the fine new sorts, may be had on application, enclosing two stamps for the postage.
Nurseries, Cheshunt, Herts.—Sept. 20.

NEW EARLY SWEET KERNELLED KAISHA APRICOT.—Strong healthy trees of the above valuable early APRICOT, which we can confidently recommend, as distinct and good, will be ready for sending out this autumn, at the following prices, with the usual discount to the trade:—

| | |
|---|---|
| One year old trees | 10*s.* 6*d.* each. |
| One year trained | 15*s.* ,, |
| Two ditto | 21*s.* ,, |
| Two year trees in pots | 21*s.* ,, |

JAMES VEITCH and SON, Exeter.—Sept. 20.

G. JACKSON, NURSERYMAN, Woking, Surrey (1½ mile from Woking Station, Southampton Railway), begs to announce that he has published a new and complete Catalogue of his American Plants, Ornamental Evergreens, Conifers, Flowering Shrubs, Standard and Dwarf Roses, Fruit and Forest Trees, &c., and may be had on application by enclosing two postage stamps.—Woking Nursery, Sept. 20.

NEW PLANTS AT REDUCED PRICES.
HENRY WALTON, FLORIST, &c., Edge End, Marsden, near Burnley, Lancashire, begs to state that his Autumn Catalogue of Geraniums, Fuchsias, Verbenas, Petunias, Cinerarias, Hollyhocks, Carnations, Picotees, and Pansies is now ready, and may be had for one stamp.
H. W. is also prepared to send out strong plants of the yet unequalled dark Pansy, "Jenning's King," 5*s.* 6*d.* each, or four to the trade 15*s.*, for description of which see Catalogues.
N.B. Parties requiring Plants to furnish new Greenhouses, &c., will be reasonably dealt with.

SAMUEL COTTINGHAM, Strawberry Plantations, Rochester, begs respectfully to call the attention of amateur and other Strawberry growers to his select assortment of ONE YEAR SEEDLING STRAWBERRY PLANTS and STRAWBERRY SEED from the best known sorts.
Having been engaged 23 years in the extensive and successful cultivation of Strawberries, he confidently recommends, to persons desirous of obtaining new sorts of first-rate quality, the present as a rare opportunity, the Seed being carefully saved at a great sacrifice of select fruit.
Twenty-four postage stamps forwarded in a letter will insure the return by rail, or other conveyance, of Twelve strong two year Seedling Plants, which will show first bloom next spring; and for Eighteen postage stamps a packet of New Seed, warranted (1851), will be returned by post, with instructions for sowing in the open air.

BEAUTIFUL NEW CAMELLIAS.—STORYII.—This beautiful Camellia was raised by W. H. Story, Esq., White Hill, Newton Bushell, Devon. It is a flower of large size and beautifully imbricated; in form equal to the old Double White; colour, deep bright rose, shading lighter to the centre. It is of unexceptionable habit and foliage, and an abundant bloomer. It is undoubtedly a first-class flower; the Seedling Plant was exhibited at the Horticultural Society's Room, Regent-street, on the 21st of March, 1848, when it had seven expanded blooms, and was awarded the Banksian Medal. Strong plants, 63s. each.

COUNTESS OF ORKNEY.—This truly magnificent variety is figured in the "Florist" for April, 1848, where it is described as follows:—"Mr. Nicholson, gardener to the Earl of Orkney, Taplow Court, is the successful raiser of the beautiful variety figured in our present Number. Our representation may be depended upon for its correctness. The plant is handsome, the foliage large and bold, of a deep rich green. The specimen from which it was copied measured 4 inches in diameter; the flower is circular in outline, composed of large stout petals, perfectly smooth on the edge; these gradually diminish towards the centre, but as they become smaller their forms are less perfect in outline. They are transparent in texture, of a creamy white, and are striped with two shades of bright rosy pink, clear and well defined. We consider it a valuable addition to any collection, and in the class to which it belongs it ranks with the best. Strong plants 63s. each.

The usual discount to the Trade.

VEITCH and SON, Exeter, Sept. 20.

MUSHROOM SPAWN.

WILLIAM GILL, Kensall-green, Harrow-road, London, has a large quantity of MUSHROOM SPAWN, in good condition, for Sale, at 1s. 6d. per bushel, in quantities of not less than 10 bushels. Carefully packed and delivered, free of charge, to any of the Railways around London. Cash on delivery.

NEW PELARGONIUMS.

CHARLES TURNER strongly recommends the following NEW PELARGONIUMS; it will be sufficient to observe that he has the entire stock of those beautiful varieties raised by E. FOSTER, Esq., and G. W. HOYLE, Esq., which obtained 9 extra prizes, and 20 Certificates, during the past season. Strong plants will be ready the first week in October. The usual discount to the Trade. If the Set is taken, a liberal allowance will be made.

ARIADNE (FOSTER).—Rosy purple bottom petals, rich dark top, with narrow margin of rose, clear white centre, free bloomer, large truss, and fine substance; good early exhibition plant; 31s. 6d.

BEATRICE (HOYLE).—Neat smooth constant flower, bottom petals mottled rose, top petals rich black, even margin of dark carmine, free bloomer; 15s.

CELIA (HOYLE).—Beautiful orange lower petals, tinged towards the centre with violet, top petals bright orange, medium spot shaded with scarlet, free and early bloomer, but curly in top petals; 15s.

CHIEFTAIN (HOYLE).—Rose crimson, with dark shaded blotch on upper petals, fiery, narrow margin, large, very stout, good habit, rather inconstant; 21s.

CHLOE (HOYLE).—Lively bright rose, white centre, medium-sized dark spot shaded with scarlet, good grower and free bloomer; 10s. 6d.

COLONEL OF THE BUFFS (HOYLE).—Novel bright orange, large and very attractive, constant, and free bloomer; 31s. 6d.

CRISTINE (HOYLE).—Delicate warm rose, with deep spot on upper petals shaded with orange, large and very free, a fine cheerful flower; 21s.

ELISE (HOYLE).—Deep warm orange pink, shaded with delicate lilac, light centre, medium-sized spot, surrounded with orange, margin of orange pink, smooth, constant, and free bloomer; 31s. 6d.

ENCHANTRESS (FOSTER).—Rosy crimson bottom petals, rich crimson blotch on top petals, with margin of bright crimson, white centre; the shape of Gipsy Bride, but twice the size, free bloomer, and good habit; 31s. 6d.

EURYDICE (FOSTER).—Deep crimson bottom petals, top petals dark maroon, narrow margin of bright crimson, free bloomer; 15s.

GANYMEDE (HOYLE).—Very round, smooth, and cupped, warm lilac colour, white centre, dark top petals, very evenly shaded with purplish carmine margined with the ground colour; 31s. 6d.

HERALD (HOYLE).—Mottled light pink bottom petals, top dark blotch, with narrow margin, white centre, good shape, and constant, very dwarf, good habit; 7th prize; 21s.

ILLUMINATOR (TURNER).—Bright mottled crimson bottom petals, rich dark crimson top, narrow bright margin, very showy and attractive, being nearly as free as the Fancies; 10s. 6d.

LABLACHE (FOSTER).—Orange rose, with dark blotch on the top petals, large white centre, good substance, very attractive variety; 21s.

LAVINIA (FOSTER).—Purple, similar in colour to Alonzo, but of finer form, rich dark top petals, with bright margin, good habit, and fine bloomer; 21s.

LITTLE NELL (TURNER).—Rosy lilac bottom petals, maroon top petals, narrow margin of rose, white centre, very free, early bloomer, good plant for exhibition; 10s. 6d.

LORD MAYOR (BLACK).—Bright crimson scarlet bottom petals, mottled, black blotch on the top petals, shaded off to the margin with scarlet crimson, very showy, and free bloomer; 15s.

MAGNET (HOYLE).—A high-coloured scarlet crimson, large black blotch varying towards the margin on a scarlet crimson ground, without being lighter on the edge, very profuse bloomer, and constant, very striking flower; 42s.

MOCHANNA (HOYLE).—Lower petals warm rose, white centre, top petals large dark blotch, shaded and mottled with scarlet, margin of ground colour, large fine shape, free, smooth, bold, attractive flower; 21s.

MONTEITH (FOSTER).—Bottom petals crimson purple, dark blotch on top petals, shaded off to the margin with crimson; 21s.

PLANTAGENET (TURNER).—Crimson bottom petals, dark maroon top petals, narrow margin of bright crimson, free bloomer; 15s.

PULCHRA (FOSTER).—Lower petals salmon rose, large rich dark blotch on top petals, with margin of bright rose, white centre; free bloomer, good habit; 21s.

PURPLE STANDARD (FOSTER).—Bottom petals rich purple, black top petals, with narrow, even, fiery margin. This flower possesses fine substance, shape, and very smooth; much the best purple; 31s. 6d.

REMUS (HOYLE).—Deep rose lower petals, with dark blotch on upper petals, shaded with scarlet; smooth, and fine shape; 21s.

RUBENS (FOSTER).—Crimson, with dark maroon blotch on top petals, narrow margin of bright crimson; good substance; 21s.

SHYLOCK (FOSTER).—Bottom petals deep rich mottled purple, black top petals, a wire margin of scarlet; medium size, free bloomer; the darkest variety raised; 31s. 6d.

VANDYKE (TURNER).—Bottom petals bright scarlet crimson, dark blotch on top petals, scarlet margin; very striking, but not a good shape; 10s. 6d.

VONDEL (HOYLE).—Lilac rose, with dark blotch on top petals; 15s.

A selection of older varieties at moderate prices. A Descriptive List may be had on application.

Royal Nursery, Slough.

LILIUM GIGANTEUM.—A few fine healthy Tubers of this magnificent Nepaul Lily have been sent to Messrs. VEITCH by Mr. T. Lobb, who collected them in their native habitat, and who speaks of it as the finest of all the Lilies he has ever seen. The flowers are white, of great size, and produced in abundance.

Dr. LINDLEY says, "Lilium Giganteum is a very fine thing; it will perhaps be as hardy as the Japan Lily."

Sir W. J. HOOKER also says, "It is a very fine large flowered species, figured by Dr. Wallich in Flora of Nepaul; the flowers are nearly white, and half a foot long, leaves very large and heart-shaped."

The Plants now offered are growing luxuriantly, and in excellent condition.

VEITCH and SON, Exeter.—Sept. 20.

HYACINTHS, TULIPS, RANUNCULUS, ANEMONES, AND DUTCH BULBS.

HENRY GROOM, Clapham Rise, near London, by appointment FLORIST TO HER MAJESTY THE QUEEN, AND TO HIS MAJESTY THE KING OF SAXONY, begs to recommend to the attention of the Nobility, Gentry, and Amateurs, his extensive collection of the above FLOWERS, which he can supply at very moderate prices. He begs to say that he has received his usual supply of HYACINTHS and DUTCH BULBS in excellent condition, and that his Catalogue will be forwarded by post, on application. This is the best season to make a selection of Bulbs.

THE FINEST NEW ROSES OF THE SEASON.

HYBRID PERPETUAL QUEEN VICTORIA (PAUL'S).—This is unquestionably the finest New Rose of the season: it is a seedling from "La Reine," of which it is so exact a copy in every respect, save colour, that it has been designated by some the "WHITE LA REINE." The ground colour is white, overlaid with the most delicate hue of pink, perfectly wax-like in appearance, and distinct from every other. Plants, in November, 10s. 6d. each, with the usual discount to the Trade when three are ordered at once.

CLIMBING PERPETUAL, ROBERT BURNS (PAUL'S).—Flowers light vivid carmine, sometimes edged with purple, large, equal to Chenedole in colour; like it not very double, but possessed of the additional advantage of flowering in the autumn. Desirable on account of its distinct and glowing colour, and a splendid autumnal climber. Plants, in November, 7s. 6d. each.

N.B. Each of these Roses has obtained a 1st Class Certificate from the National Floricultural Society; the former has also received the same from the Royal South London Floricultural Society. Also a fine collection of Hollyhocks now in bloom.

A. PAUL and SON, Nurserymen, Cheshunt, Herts.

DUTCH HYACINTHS, per doz., 6s. to 12s.

Or an assortment of three dozen, best sorts, for 16s. 6d.

63, South Audley-street.—Sept. 20.

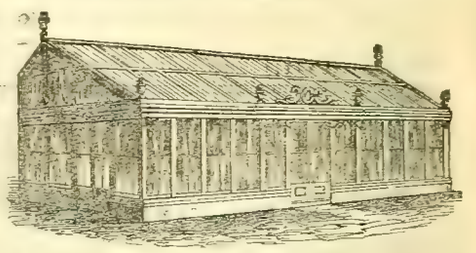
TO NURSERYMEN, GENTLEMEN'S GARDENERS, &c.

EDWARD KEMP respectfully intimates to those friends who have not yet laid in their stock of PEAT, LOAM, &c., that they ought not to delay, as the weather is now very favourable, and cannot be expected to last much longer. He is now getting in some of excellent quality, and respectfully solicits their early orders, addressed to E. KEMP, 16, Ann's-place, East-street, Old Kent-road, London.

N.B. Silver Sand, and all other Soils, as usual.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

J. WEEKS AND Co., King's-road, Chelsea, HORTICULTURAL ARCHITECTS, ENGINEERS, and BUILDERS. These Boilers are very powerful, durable, and economical. The fire warranted to last 15 hours without attention. The Furnace Bars are Hollow Tubes, through which the return water passes before entering the upper part of the Boiler, thereby causing a very rapid circulation, and producing double the effect from the same quantity of fuel.



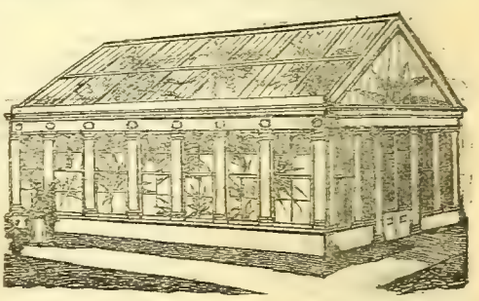
J. WEEKS and Co., King's-road, Chelsea, CHALLENGE the whole world to make a Boiler that will produce anything like the same effect, with the same quantity of Fuel, in a given time. It is one of these Boilers that warms the water of their VICTORIA REGIA Tank, which contains 9000 gallons, and also heats several large Forcing-houses and ranges of Pits, with a small consumption of fuel.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

PERMANENT PASTURE.

HENRY ROGER SMITHE, of Eastling, Faversham, Kent, informs the public that his mixtures of the NATURAL GRASSES and small CLOVERS, gathered under his own superintendence, including every sort necessary to form a Permanent Pasture, on various soils, are now ready; delivered on the South-Eastern Railway, at 1l. per acre, allowing three bushels per acre. Also Seeds for Lawns, and for renovating old pastures; the nature of the soil to be sown should be particularly stated. Instructions for sowing will be sent with each parcel. Seeds are this year comparatively scarce; the Advertiser has, however, determined not to raise his prices, considering the ruinous effects of free trade on Agriculture, and depending on the extension of his business for a return of his outlay.

HOTHOUSES AND CONSERVATORIES.



HOTHOUSES AND CONSERVATORIES made and fixed complete in all parts of the kingdom, at a considerable reduction. One, two, and three-light Cucumber and Melon Boxes, and Lights of all sizes, kept ready for use, packed and sent to all parts of the kingdom, warranted best material. Garden Lights of every description, at JAMES WATTS', HOTHOUSE BUILDER, CLAREMONT-PLACE, OLD KENT-ROAD. References may be had to the Nobility, Gentry, and the Trade, in most of the counties of England.

GREEN AND HOTHOUSE BUILDER.—Green and Hothouses made by Machinery, sent to all parts of the United Kingdom. These Horticultural Buildings are warranted to be made of the best materials, and the cheapest in England. Lists of prices post free. 1¼ in. greenhouse lights, 2½d.; 1¾ in. ditto, 3d.; 2 in. ditto, 3½d. per foot; if glazed with 16 oz. sheet-glass of a large size, 4d. per foot extra.

J. LEWIS, Horticultural Works, Stamford-hill, Middlesex.

HORTICULTURAL BUILDING AND HEATING BY HOT-WATER, AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.

GRAY AND ORMSON, Danvers-street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are now in a position to execute orders on the lowest possible terms.

G. & Co. have been extensively employed by the Nobility, Gentry, and London Nurserymen, and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-Water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Hearing by Hot Water can be made available.

GREAT EXHIBITION.—New system of GLAZING GREENHOUSES, &c., without the use of putty or other adhesive compost, by ALFRED KENT, Chichester, as shown in a Model at the West End of the Building, out-side. This invention has attracted universal notice amongst Horticulturists and others, and has maintained, under the scrutiny of the public eye, its pretensions to overcome the great evil of all other cheap systems of Glazing, viz., leakage. A. KENT having made great improvements in manufacturing the parts required in this invention, can now offer his new system at a less cost than as before advertised:—24-inch Greenhouse Lights, complete, at 1s. per ft., superficial; 2-inch do., 10d. do.; 1¼-inch do., 8d do.

Can be packed securely, and sent to any part of the country.

The saving of repairs effected by this system, over all others, being of paramount importance, A. KENT is willing to reply to any communication (post paid), explaining how such a saving is effected. Estimates given for the entire erection of Greenhouses in any part.

The Inventor is open to co-operate with any extensive Horticultural Builder in London, to Manufacture and carry on the Patent, or to dispose of the Invention entire.

WANTED, immediately, a small lean-to GREENHOUSE, in good condition, 14 feet clear by 10 feet wide.—Address, with lowest price and particulars, to G., care of Mr. Drewett, House Agent, &c., Walton-on-Thames, Surrey.

TO BE SOLD, a Cheap and Substantially-built GREENHOUSE, 36 feet long by 12 feet wide, with about 20 dozen ACACIA ARMATA, good blooming plants. No reasonable price will be refused, as the ground is required for public works.—Apply to THOMAS STREET, Florist, near the Railway Station, Hackney, near London.

TO BE SOLD, cheap, a second-hand GREENHOUSE (a lean-to), in tolerably good preservation, 18 feet long, 12 feet wide, 14 feet high at the back, and 4 feet 2 inches high in the front, exclusive of the brickwork and stage. To be seen in Mr PARNELL'S garden, Waltham Abbey Essex.

TO BE SOLD, a GREENHOUSE, with Hot-water Apparatus and Plants, together or separate; the Greenhouse is nearly new, with Slate Shelves, Flower-stand, and is heated with Burbidge and Healey's most perfect, simple, and economical Hot-water Apparatus. The Greenhouse is 24 feet long by 14 feet wide, with large squares of 16 oz. sheet glass. The whole to be sold for little more than half price, viz., 100l., all complete, with Vines, &c. The plants in pots Camellias, Azaleas, Geraniums, &c., as well as a choice lot of Roses and other Flowers in the Garden, to be sold by valuation or otherwise.—To be seen at 19, Tollington-park, Hornsey-road, near London.

NEW ROSES.

WILLIAM WOOD AND SON have the pleasure of announcing that their DESCRIPTIVE CATALOGUE OF ROSES is now ready, and will be forwarded to all who have patronised them, and post free to all applicants. Such extensive addition has been made to their Stock, that they are able to execute orders of any magnitude with good Plants and without substitutions.

The above can be obtained in London of Messrs. NIXON, 125, Great Portland-street, Oxford-street; of Messrs. HURST and M'MULLEN, 6, Leadenhall-street; and of Mr. CARTER, 238, High Holborn. And at the Nursery the following: a Catalogue of Ornamental Trees and Shrubs, including a fine collection of Coniferæ and choice Herbaceous Plants; and a Descriptive Catalogue of New and Select Fruits. The Trade Catalogue is also now ready.

Woodlands Nursery, Maresfield, Uckfield, Sussex.

BRITANNIA STRAWBERRY. — The combined excellencies of this STRAWBERRY are robust habit, an abundant bearer, good flavour, large size, and of a deep scarlet colour, season of ripening late. See the *North British Agriculturist*, August 8, of last year.—Strong plants of this superb Strawberry are now ready for sale, price 30*s.* per 100, on application to SAMUEL JACKSON, Gardener, Marfleet-lane, Hull. A Post-office order is requested on the receipt of plants. The usual allowance to the trade.

SANGSTER'S NEW EARLY No. 1 PEA.

HAY, SANGSTER, AND CO., in submitting the above valuable PEA to the public, can recommend it with the greatest confidence, as the largest podded and best Early Pea known, and of first-rate quality; height, 2 feet. Price 2*s.* 6*d.* per quart.

York Regent Potatoes, from prepared cuttings, 6*s.* per bush. Cambridge Radical do. (a first-rate second early) 6*s.* do. Early Oxford do., 10*s.* 6*d.* do. Early Ebrington Kidney do., 10*s.* 6*d.* do. Early Ash-leaf Kidney do., 10*s.* 6*d.* do.

Post-office orders to be made payable at the Borough Post-office to HAY, SANGSTER, and Co., Nursery and Seedsmen, Newington Butts, London. One-bushel hampers and booking, 1*s.* 6*d.*; two-bushel, 2*s.* 6*d.* Sacks, 2*s.* 6*d.* each.

THE AMERICAN NURSERY, BAGSHOT, SURREY.

JOHN WATERER begs to announce that he has just published a new CATALOGUE of Hardy Rhododendrons, Azaleas, Roses, Conifers, &c., and which may be obtained by enclosing two postage stamps.

*** The Colours of all the Rhododendrons worthy of cultivation are described; thus purchasers are afforded every facility in making selections.

GUERNSEY AND BELLADONNA LILIES.

B. PAGE AND CO. have the pleasure to offer FINE FLOWERING BULBS of the above beautiful Autumnal Lilies.

| | Per dozen.—*s.* | *d.* |
|---|---|---|
| GUERNSEY LILIES | 4 | 0 |
| BELLADONNA DITTO | 4 | 0 |
| EARLY DOUBLE ROMAN NARCISSUS | 4 | 0 |
| LARGEST DOUBLE JONQUILS | 4 | 0 |

B. P. and Co. have received their ANNUAL IMPORTATION of DUTCH BULBS in the finest possible condition, which they are able to offer at greatly reduced rates, priced Catalogues of which may be had upon application to PAGE and Co., Seed Merchants, Southampton.

CAMELLIAS AND INDIAN AZALEAS WITH FLOWER BUDS.

AUGUSTE VAN GEERT, NURSERYMAN, Ghent, Belgium, begs to offer to the Trade and Public in general, fine CAMELLIAS, with flower buds, at 6*l.* per 100 and upwards, all good and well shaped flowers. INDIAN AZALEAS, well set with bloom, from 5*l.* to 7*l.* per 100 and upwards. His new Catalogue, just published, may be had on aplication to Mr. R. SILVERRAD, 5, Harp-lane, Great Tower-street, London.

GOLIATH STRAWBERRY.—A Post-office order for 5*s.* will secure (package free) 100 strong plants of this celebrated Strawberry, or 12 plants, free by post, on receipt of 18 postage stamps. Also TROLLOP'S VICTORIA, 4*s.* per 100, and any of the old varieties at very low prices. The usual allowance to the trade.—JAS. KITLEY, Lyncomb Vale Nursery, Bath.

MYATT'S NEW SEEDLING STRAWBERRY, "QUINQUEFOLIA."—The character of this Strawberry is quite distinct, having generally five leaves on each foot-stalk. The trusses are strong, producing an abundance of large fruit of a fine flavour. For general description, see *Gardeners' Chronicle*, of July 12th, and "Gardeners' Journal," of July 19th. Plants of this variety 50*s.* per 100; also Myatt's Surprise, 21*s.*; British Queen, Eleanor, Globe, Deptford Pine, Mammoth, Eliza, Fertilised Hautbois, Hooper's Seedling, Keen's Seedling, Swainstone Seedling, Elton Pine, Black Prince, Bicton Pine (white), 3*s.* 6*d.* per 100. Kitley's Goliah, 5*s.*; Jackson's Britannia, 5*s.*—Post-office orders are requested to be made payable to JOSEPH MYATT, Manor Farm, Deptford, Kent.—Sept. 20.

**The Gardeners' Chronicle.**

*SATURDAY, SEPTEMBER* 20, 1851.

MEETINGS FOR THE ENSUING WEEK.

TUESDAY, Sept. 23—London Floricultural.....1 P.M.
COUNTRY SHOWS.—Wednesday, Sept. 24: North London (Highgate) Dahlia.—Thursday, Sept. 25: Stoke Newington Dahlia, and Oxford Horticultural.

THERE are few gardens in which, at this time of year, you may not find snug places in which Sow-thistle, Dandelion, Groundsel, and the annual Spurges are enjoying themselves, and providing rapidly for the establishment of a nice young family. If you look among the flower borders you will probably find none of them; among the kitchen garden crops they may possibly be wanting; and hence it may be imagined that in such places at least they are missing. We not long since met with an innocent gentleman who pointed with much complacency to his borders and kept ground, intending doubtless that his garden should be looked upon as a sort of model; and he was quite surprised at being told that it was slovenly, because his old Strawberry beds had been forgotten, and were rejoicing in a flourishing crop of weeds. "Oh!" said he, "as to them, there is only a few Groundsels and Dandelions and Sow-thistles, I'll pull them up in a minute;" and sure enough, in less than a minute, a handful or two of these plants had been torn up, and we were in a cloud of their downy seeds.

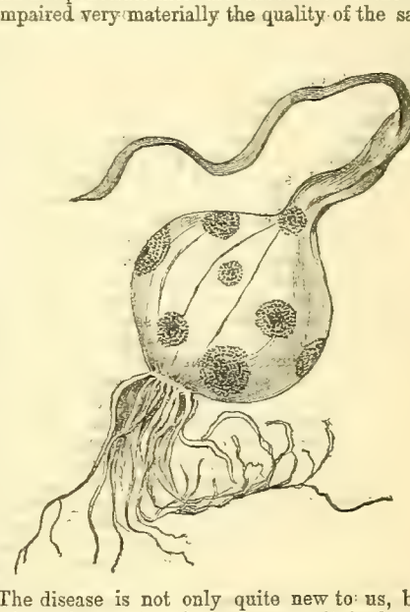
Only a few Groundsels, and Dandelions, and Sow-thistles! What a speech for a gardener! What a lesson for the young men he was training up! And nevertheless, what an every-day occurrence. It probably did not strike our innocent friend that these plants grow from seed; perhaps he thought that weeds *came of themselves*. And yet we can assure him that they grow like his Mignonette and China Asters that he takes such pains to save the seed of. Nay, more, we will recommend to his notice the following calculation, made on a very low average of cases.

The common Groundsel ripens about 52 seeds in each head of flowers; and produces about 40 heads, or 2080 seeds. The Dandelion ripens about 135 seeds in each head, of which it produces about 20, or 2700 seeds. The Sow-thistle ripens about 230 seeds in each head, and produces about 48, thus yielding 11,040 seeds per plant. The annual Spurges form about 180 seed-vessels, each containing three seeds, and therefore produce about 540 seeds per plant. These are, as we have said, very low averages.

Now, according to this calculation—

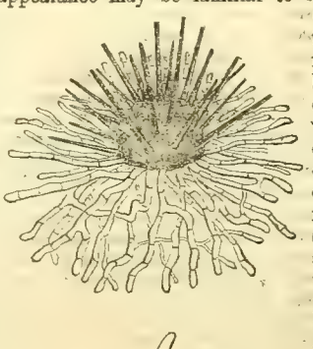
| | Seeds. | |
|---|---|---|
| 1 Groundsel producing | 2080 | |
| 1 Dandelion | 2700 | =16,360 plants, |
| 1 Sow-thistle | 11,040 | |
| 1 Spurge | 540 | |

which will cover *just about three acres and a half of land, at 3 feet apart.* To hoe land costs, we will say, 6*s.* per acre, so that the allowing four such weeds to produce their seed may involve an expense of a guinea. In other words, a man throws away 5*s.* 3*d.* a time as often as he neglects to bend his back to pull up a young weed before it begins to fulfil the first law of nature. We know that some well fed folks object to all inflexion or deflexion of the vertebral column—they are generally fond of hard words—but then they also object to its being considered in their wages, which is not exactly fair.



Let us look at the foregoing data in another point of view. Every Dandelion left to flourish unchecked may plant an acre of ground 4 feet apart; every Sow-thistle may do the same 2 feet apart; every Groundsel 5 feet apart, allowing for waste. Supposing a garden to consist of two acres, 16 Dandelions, or 4 Sow-thistles, or 21 Groundsels, or 80 Spurges will cover it with a crop a foot apart. Taking this calculation in their hand we recommend every body afflicted with weeds, or with a gardener whose vertebral column will not bend, as aforesaid, just at this time of year, to count the Dandelions, Groundsels, Sow-thistles, and Spurges upon the first square rod of ground they can measure off.

Seriously, this forgetfulness of the consequences of allowing weeds to seed is a fault of the first magnitude; the more inexcusable, because no skill is required to remedy it; nothing whatever, except industry and foresight, is demanded. It is quite certain that any garden may be thoroughly and permanently cleaned, if the gardener will bestir himself, and if his master will support him. It is quite certain that the cost of once effectually eradicating these things, is as nothing, when compared with the endless charge of hoeing and raking them up. As practised in some places, the gardener reminds us of the gentleman who spent his time in twisting ropes of sand, or of those unlucky daughters of DANAUS, who were condemned to the interesting occupation of pouring water into a sieve. We would even suggest that a weed-neglecting gardener should receive the name and title of a DANAID.



If the true history of the growth of weeds were inquired into, we suspect that our old enemy, procrastination, would be found at the bottom of it. They are so easy to kill, that any time will do. They are so little at first, that they are not worth pulling up. They are so common, that nobody minds them. "It's only a bit of Grunsel, sir," is the common reply to a remonstrance against slovenliness. A man will pass one of these weeds day after day for weeks; he will watch it from its smooth leaves to its rough leaves, then to its flowers; and, at last, to the lovely down which it so plentifully disperses, and when at last he pulls it up, it is just too late, the plant having already distributed its favours over all the neighbourhood. If he would but have stooped once more than usual, he would have destroyed the mother of an acre of nuisances.

One day, after walking very carefully through a nursery in the west of England, we could not help expressing our satisfaction at not having seen one single weed over many acres of highly kept ground. The answer of the proprietor was, "Weeds, sir, are too expensive for us; we can't afford them." What a bitter sarcasm upon the mass of cultivators!

AMONGST the seeds distributed by the Horticultural Society last spring were those of a very beautiful white Onion, called Ognon de Nocera, received from Paris. Nothing can exceed the beauty of its form, and the extreme purity of its snowy whiteness, which excludes every tint of red, brown, or yellow, and makes it the very perfection of pickling Onions. Just, however, before the crop was ready, a disease, if it may be so called, appeared, which completely marred its beauty. Almost every Onion was covered with round black spots, consisting of more or less concentric dots, which, though they did not penetrate into the substance of the bulbs, impaired very materially the quality of the sample.

The disease is not only quite new to us, but the minute fungus, to whose presence it is due, is an extremely pretty object. It is possible that the appearance may be familiar to some of our large Onion growers, though we have not observed it before, and it was confined to the one variety, though others close to it on ground of precisely the same nature, and under exactly the same system of cultivation, were completely free. The species of *Vermicularia*, to which it is due, is certainly undescribed, but should it have occurred elsewhere, we should be greatly obliged for specimens, accompanied by the name of the particular variety on which it has been observed. We are the more anxious for information on the subject, because at present it seems to be a case of a new plague imported from foreign seed, and actual specimens are necessary, because a somewhat similar appearance often occurs on the necks of Onions, and more rarely on the bulbs, caused by entirely different parasites.

The spots consist of multitudes of distinct extremely minute subglobose perithecia, clothed with long rigid black hairs, and sending off in every direction from the base flexuous hyaline articulated often branched or anastomosing threads, which contrast very prettily with the dark bodies seated on them. The spores are oblong, slightly curved, and attenuated at either end, though the very tip is obtuse. Their endochrome is either retracted to either end, leaving a free space in the centre, which looks like a septum, or the whole mass is broken up into several round bodies. The species may be characterised:—

*Vermicularia circinans*; maculis orbicularibus; perithecii concentricis mycelio hyalino articulato radiato insidentibus. *M. J. B.*

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

SECTION D. *Tuesday, July* 8.—*On some facts tending to show the probability of the Conversion of Asci into Spores in certain Fungi*; by Rev. M. J. BERKELEY and Mr. C. E. BROOME.—After alluding to the observations of other botanists on this subject, the authors communicated as follows. The species which have afforded the materials for the following remarks are more especially three, viz. Tympanis saligna, Tode;

Sphæria inguinans, Tode; and Hendersonia mutabilis; Berkeley and Broome. Tympanis saligna scarcely differs from a Lichen, except in the total absence of a crust, and consequently of gonidia. Its apothecia are at first closed, but at a later period of growth, the fructifying disc or hymenium is exposed. On the same twig, in this instance of the common Privet, some specimens exhibited all the characters of Tympanis, and others those of Diplodia. As long as the naked spores occurred only in specimens in which the disc was not expanded, this caused no surprise, as nothing is more common than to find Sphæria and Diplodia on the same matrix, which cannot be distinguished externally, but further examination exhibited the proper fructification of Diplodia in specimens with an open disc, a character quite at variance with that of the genus, and then the same hymenium was detected producing rather large uniseptate naked spores, and broad elongated asci exceeding them many times in length and containing a multitude of minute oblong sporidia. Prof. Fries, in a letter lately received, informs us that he has observed a similar fact in "Hendersonia Syringæ." The circumstance of the constant or occasional occurrence of Uredo and Puccinia, Uredo and Aregma, Uredo and Xenodochus, or two species of the same genus in the same spot, may be adduced as analagous; but where there is no perithecium, the occurrence of two species on the same spot, of the same matrix, is not matter of so much surprise, though suggestive of further consideration. The case, however, of Sphæria inguinans, which we have now to bring forward, is still stronger. This species and Stilbospora macrosperma were extremly abundant on an old Elm at Batheaston, in January last. Not only were they so intermixed as to make it difficult—from the close resemblance of the fruit, that of the one being merely a little more elongated, and in a very slight degree more attenuated at either extremity, with rather a browner tinge—to say at once which was the Sphæria, which the Stilbospora; but the same orifice in the back gave egress both to the sporidia of the one and the spores of the other. At the base of the spores of the Stilbospora, where, seated on their sporophores, from one to three short sheaths were observed, as if the spore had burst through one or more enveloping membranes; but not only was the Stilbospora produced in the same portion of the bark as the Sphæria, or, perhaps, to speak more correctly, in the same stroma; but in one case it was actually developed on the external surface of a perithecium, the inner surface giving rise to perfect asci, with their proper sporidia. In a certain stage of growth the sporidia of the Sphæria are furnished at either extremity with a cirrhiform appendage, but this is not always visible in the ejected mass which surrounds the common orifice of the perithecia. Analogous appendages occur in some other species. The third case to which we invite attention is Hendersonia mutabilis, a species which occurs on twigs of Plane. The main perithecium contains one or more cavities, more or less isolated, which produce far smaller hyaline bodies, and which do not accord with the genus Hendersonia, but rather with Phoma. This is not indeed a case bearing upon the conversion of asci into spores, but is interesting as exhibiting one perithecium within another; and whether considered as a new cell developed within the old one, and consequently containing younger spores, a view at first adopted, but which, on mature consideration, seems scarcely tenable: or as two forms of spores both belonging to the same species, but produced in distinct cavities: or, finally, as two genera united within the same common receptacle is full of interest. We are not prepared, as in the last case, to say that the same wall from its two sides produces different forms of fruit, though in some sections the two fertile surfaces are so confluent above, that it is very probable that the same fact will be found to obtain here also. These instances certainly seem to indicate rather a transformation of organs than any totally distinct productions, a view indeed which is not at variance with the possibility of the transformed organs, being an indication of sexual functions, if we may be allowed to form any inference from known analogies in the animal world. Dr. Hooker, when examining the fruit of Laminariæ on his return from the antarctic expedition, felt convinced of the possibility of the transformation of an ascus into a spore, a view entertained long since by Fries, and which is supported by those instances in Fungi and Lichens, where a single spore only is developed in an ascus. The difference in the analysis of the genus Sphærophorus, as given by Dr. Montagne in the "Annales des Sciences Naturelles," and by Dr. Hooker in the "Antarctic Flora," is probably due to a similar change; the former exhibiting true asci containing sporidia, the latter moniliform threads, breaking up into spores. In earlier times the analysis of one would have been pronounced erroneous, but the present age, with deeper knowledge of the apparent anomalies exhibited by Nature, and consequently a greater measure of diffidence, regards such discrepancies as calls to further investigations, and as the possibly available keys for the solution of difficulties which have been hitherto insurmountable.

At the conclusion of this paper, Dr. Joseph Hooker made some remarks on the forms which he had observed the reproductive cells of Algæ to assume, and urged the necessity of further investigation on this subject.

## ORCHIDS FOR THE MILLION.—No. XVI.

By B. S. WILLIAMS, gr. to C. B. WARNER, Esq., Hoddesdon.

CLIMATE HOT AND DAMP.—PLANTS GROWN IN BASKETS, WITH MOSS.

*Dendrobium Cambridgeanum.*—This splendid species, from India, flowers in March and April; the colour is a deep orange. It will succeed on a block, but it does best in a basket, filled with sphagnum and potsherds, suspended from the roof with plenty of heat and moisture during the growing season; afterwards it should be kept nearly dry and cool: the flowers last about two weeks.

*Dendrobium macrophyllum*, from the Phillippine Islands, with fine large pink flowers tinged with purple; blooms from February to May. It will thrive on a block, but it does best in a basket, in moss and potsherds; it likes plenty of heat and moisture during the growing season; afterwards it may be kept cool and nearly dry: it last about ten days in perfection.

*Dendrobium moniliforme*, comes from China; it blooms from February to May. It likes plenty of heat and moisture during the growing season; afterwards it should be kept much cooler and rather dry: it remains three weeks in beauty.

*Dendrobium Devonianum.*—A splendid plant from India; thrives well in a basket, with moss and potsherds, suspended from the roof, where there is plenty of heat and moisture; it flowers in May and June.

*Dendrobium Gibsonianum*, from India, flowers in September; the sepals and petals are rich orange, the lip bright yellow, with two dark spots on the upper part. It grows well in a basket, with moss and potsherds, with plenty of heat and moisture during the growing season; the flowers remain long in perfection.

*Dendrobium sanguinolentum.*—This fine Indian species flowers from June to September; it likes plenty of heat and moisture when it is making its growth. It will keep in blossom for two or three months.

*Dendrobium Pierardi* (*latifolium*).—India; it flowers in April and May; the blossoms are white. A basket, with moss and potsherds, suspended, where there is a good supply of heat and moisture during the growing season, suits it perfectly; afterwards it should be kept less moist. The blossoms remain about two weeks in perfection.

*Dendrobium fimbriatum* blooms in March and April; the flowers are a rich yellow, the lip being beautifully fringed. It succeeds best in a basket, with moss and potsherds, and it should have plenty of heat and moisture during the growing season. It seldom lasts more than four days in flower.

*Dendrobium Dalhousieanum.*—This beautiful Indian species flowers in April and May; the blossoms are large, of a pale lemon colour, with a pink margin, and two dark blood-coloured spots in the centre. It succeeds well in a basket with moss and potsherds. The flowers last but a short time in beauty.

*Dendrobium formosum* flowers in August and September. The blossoms are fine white, with a bright yellow centre, and they will last six weeks in perfection, if they are kept dry. It succeeds best in a wooden basket, with sphagnum moss and potsherds, suspended from the roof. It likes plenty of heat and moisture in the growing season, afterwards it should be placed at the cooler end of the house, and receive less moisture; this kind of treatment applies to all the following Dendrobes.

*Dendrobium nobile.*—This esteemed species flowers from February to May. Its flowers will last three or four weeks in beauty, if they are kept dry.

*Dendrobium Wallichianum.*—This beautiful Indian kind has darker and even finer flowers than those of nobile; it blossoms from March to May. It likes plenty of heat and moisture in the growing season, but afterwards a dry cool house suits it best. Its flowers remain four or five weeks in perfection.

*Dendrobium Paxtoni* is a charming species from India. It blossoms in May, and its flowers are of a beautiful orange colour, with a dark centre. It will last two weeks in bloom, and should be kept rather dry when it has ceased to grow.

*Dendrobium chrysanthum.*—An Indian species which flowers at different times of the year. The colour is deep yellow, with a dark red spot on the lip; and it remains two weeks in perfection. Keep it all the growing season in heat, afterwards let it be cool.

## BRITISH SONG BIRDS.

(CAGE BIRDS, No. 30.)

No. XLVI.—The year is now fairly in its decline. The harvest is over, the barns are well filled, and Nature wears a face that it is truly lovely to look upon. The heat has abated. The winds have been heard whistling loudly in the high trees, the heavy foliage has bent before the blast; and, parted from their parent branches, leaves of every hue lie scattered on the ground. Yet is the weather gloriously fine; and should winter but follow suit with our spring, summer, and autumn,—then will 1851 be recorded as an "*Annus Mirabilis*" indeed!

As for the season of Autumn, in which we are now revelling, the "oldest inhabitant" remembers nothing to compare with it. As a queen she came in; as a queen she reigns, and carries happiness in her train:—

> "She turns with the step of a regal invader,
> And treads the fair gardens where summer has stray'd.—"

Yet is her gentle step so modest withal, and her tread so fairly-like, that she exacts and receives willing homage from all her loving subjects, while she scatters blessings on them at every turn:—

> "The Rose at her coming turns pallid, and folding
> Her pink-vision petals, calls Death to her shrine;
> The Peach and the Nect'rine, her soft eye beholding,
> Blush red with confusion, and melt into wine."

Such is the goddess who now holds her court amongst us happy mortals; but in this our selfishness we are forgetting our little friends,—the birds.

As this is the precise time for parting with our summer visitors—some of them indeed have already taken their leave—we will devote our present thoughts to them *only*; and offer a few observations on their migratory feelings,—whether inherent in such of the tribes as are at liberty, or in those which are in confinement. I propose also, to glance at the instinct which regulates all their motions and habits. First, of the Swallow.

Amongst these happy, social families, there appears to exist an understanding perfectly marvellous; with one accord they assemble, or at a given signal they disperse. Just now, they may be seen hovering over the osiers between Chiswick and Richmond in countless numbers, and they are evidently about to decamp immediately to the palms of Africa, or the Orange groves of Italy:—

> "———Toss'd wide around,
> O'er the calm sky, in convolution swift,
> The feather'd eddy floats: rejoicing once,
> 'Ere t) their winter slumbers they retire;
> In clusters clung, beneath the mouldering banks,
> And where, unpierced by frosts, the cavern sweats,
> Or rather,—into warmer climes convey'd
> With other kindred birds of season: there
> They twitter cheerful, till the vernal months
> Invite them welcome back."

It has been imagined by some speculative minds, that all young birds are under the disposition and guidance of the older ones; and that if young birds *only* were living here, they would, for want of a conductor, perish! This view is absurdly incorrect. All persons who have given the subject anything like attention, must be aware that birds of passage in particular act from an irresistible impulse at certain seasons. Whether Nature operates upon their brain in any particular manner, or not, it is difficult to say; but true to their time, every bird, young or old, would decamp with unerring prescience to his change of quarters, however distant. It is a beautiful provision of Nature to endow all these little foreign visitors with such wonderful powers of locomotion, and to direct them so instinctively in their flights. I imagine there are very few indeed lost by the way, unless it be from illness or other natural causes; and as we see, year by year, the return of certain birds to their former haunts, the "principle" I advocate must be correct. As with the "passenger pigeon," there would seem to exist in all migratory birds, the will and the power to travel to any particular part of the world; and where their *inclination leads them*, thither do they flock.

I have spoken as yet of the swallow tribe only—these, from their large multitudes, being so prominently before the eye. But the same unerring instinct, the same desire to depart, inhabits equally the breast of *every* migratory bird. The smaller and weaker tribes do not, like the swallow, disappear at once. The nightingale, blackcap, garden warbler, whitethroat, and others, travel through our gardens and orchards at an easy rate, until they reach the coast. Here they wait for a mild, quiet, day, and then cross the Channel at their leisure. Having thoroughly moulted in this country, and had plenty of time to renew their strength, their powers of locomotion are, at the time of their final departure, quite adequate for the effort. Once across, by easy stages they gain access to their new quarters. When the winds blow heavily, some of these little fellows are occasionally obliged to take refuge in the rigging of vessels at sea. Here they tarry until the weather moderates; they then renew their flight.

Connected with the subject of instinct, we have so many interesting investigations to make, so many novel observations to offer,—that we feel our task, as we travel gently onwards, will be a most pleasing one. We are assured of the undivided attention of a large and daily increasing auditory. Thus encouraged, we will try to define the nice difference between "instinct" and "reason." No easy matter this, truly; but an inquiring mind, though beset by difficulties, never recognises the ugly word,—"impossibility." It unfortunately still holds a place in our modern dictionaries; but the sooner it is expunged, the better will it be for the world at large. *William Kidd.*

## Home Correspondence.

*Pruning Forest Trees.*—I have been somewhat surprised to find in a late Number, the old subject of "forest tree pruning" revived. I had concluded that it was quite set at rest, since all its former advocates (as far as I know) seemed to have been silenced; whether convinced of their error I cannot tell, but echo sayeth not. I have not seen Mr. G. L.'s lucubration, but it would seem, from the communication of your more recent correspondent "Expertus," that both "G. L." and himself take it for granted that "pruning" is quite proper, and differ only as to the mode in which it should be performed; or whether snagging or close cutting is preferable. Now the best advice that can be offered to both your correspondents, is precisely what you have given the latter, viz., "prune not at all." Yet, with all due deference to "Expertus," I beg to assure him that however the face of a close cut wound may seem "hermetically sealed," when covered with new growth, there is in reality no union. Suppose a tree that was "pruned" by close cutting 30 years ago, and the cut face (say 2 or 3 inches in diameter), were sawn into boards, and the saw passing close by the "hermetically sealed" cut, it would be found just as it was when the sealing process was completed. [To be sure.] I should like to refer all who still hanker after "pruning," to the beautiful examples of its effects in the museum at Kew,—this refers merely to its effects on the timber,—how systematic "pruning" acts on growth is quite another branch of the subject. And

my hope is, that among all considerate proprietors and their agents, systematic "pruning" is now prohibited. More anon. *Quercus.*

*Potatoes.*—Early in February I chose a part of the garden where the soil is very light, and after giving it a good dressing of farm-yard manure, I planted it with Potatoes in rows 2 feet apart and 6 inches deep. They came up very strongly, and I drew the soil up to their stems, to protect them from frost. The first week in August I observed that disease was making its appearance on the points of the leaves. As the tubers had attained their full size, and were all but ripe, I had the haulm pulled up, leaving the Potatoes in the ground, and now I have as fine a crop of clean sizeable Potatoes as any one could wish for, without the least symptoms of disease, while many in this neighbourhood have lost half their crop. *J. Rust, Enfield, Sept.* 10.

*American Aloe.*—A fine specimen of the striped leaved American Aloe is now in flower here. Its height is 20 feet, and it has upwards of 1200 flowers on it. I believe that the plant is between 80 and 90 years old. It has been in the possession of Sir T. G. Cullum, Bart., about 14 years. *Thomas Smy, Hardwick Gardens, Bury St. Edmunds.*

*The Vitality of Seeds* is a subject that ought to engage the attention of the geologist as well as the botanist, for if they were to turn their mind that way, I think they would find almost every soil of recent formation contains some seeds peculiar to it. I have come to this conclusion by observing the vegetation of plants in soil brought from a considerable depth, and exposed to the common influence of our world, under which vegetables live. I imagine that if I were to send you a quantity of carse soil from the neighbourhood of Stirling, although it was dug several feet under the old Roman road, you would obtain a crop of Charlock (Sinapis arvensis). In another locality I have met with the Lepidium arvense, in soil that was newly turned up; it grew for a year or two, and has never made its appearance since, nor was it seen at least for several years before the soil was turned up. There are also some kinds of peat, when brought to the surface, which are sure to produce a crop of Knot-grass and Sorrel. Other plants may be found occasionally, but there are others we are almost sure of at all times. The stomach of man will not kill the life of the seed of the Raspberry in every case. Some years ago a lime-work was opened in a moorland district of the country, where plants of the garden were never cultivated in the memory of man, yet in a small wood adjoining there was seen a nursery of Raspberry, Currant, and Gooseberry bushes, in all probability planted by man after the seeds had been in his stomach. It is the duty and privilege often of philosophers to dispel the mists of ignorance from the world in which they live, but they sometimes overshoot their mark, and meet with signal defeats while they endeavour to clear up "popular delusions." You know steaming over to America was set down as a popular delusion by some mathematicians, and the science of calculation was brought in to show the impossibility of it, and yet one of them lived long enough to see it done experimentally. The "Penny Cyclopædia" tells us that the history of aërolites affords a most useful lesson how cautious we ought to be not to reject too hastily the narratives either of early authors or of living witnesses, however extraordinary they may be, solely on the ground that they are inconsistent with our experience of the laws of Nature. When the official notice from the local authorities of the shower of stones at L'Aigle, in Normandy, in 1803, was received at Paris, it afforded a subject of merriment to the wits of that day, and the newspapers expressed their compassion for the good people of L'Aigle, who were governed by a mayor so silly as to give credit to such nonsense as that stones had fallen from the clouds; and yet, by a series of observations and experiments, not only was the truth of the recent occurrences established, but instances recorded by the writers of past times, which had been rejected as the delusion of a credulous and ignorant age, received so high a degree of probability as to entitle them to be classed among the authentic documents of past events in the physical history of the earth. I am of opinion that the unbelievers in the doctrines of aërolites would have had the infidelity knocked out of their heads had they got a shower of the meteoric stones about their ears which I saw the other week in the British Museum. They would have felt to their experience that seeing is believing, and feeling is the naked truth. *Peter Mackenzie, West Plean.*

*The Doab Grass of India.*—Might not this Grass, which is one of the commonest and most beautiful in the East Indies, be imported into this country with great advantage, as a sole component in the laying down of lawns and kept grounds? In its native country, a natural velvety carpet, of the most beautiful texture, is very speedily formed, by merely chopping it in pieces, and strewing it over the ground prepared for the purpose, which, in an incredibly short space of time, is covered with a verdant sward. The question would perhaps be, would it be sufficiently hardy for our climate? I am not aware that it has been tried; but I should certainly regard it as worthy of consideration as an agricultural Grass, as there is little doubt about its nutritive qualities, considered as the food of animals. *Vile Dulci, Sept.* 8. [If our correspondent will consult Sinclair's "Hortus Gramineus Woburnensis," p. 292, he will find that this plant, *Cynodon Dactylon*, has been already tried, and found unsuited to Great Britain.]

*Swifts and Hornets in Yorkshire* (see p. 566.)—Your correspondent, "T. S.," is perfectly correct in stating that swifts and hornets are to be met with in Yorkshire more especially in the North Riding. I have seen both in this neighbourhood this year, and in very hot summers they may be found in great numbers. I have met with two hornets' nests this season, and I am sorry that I cannot corroborate "T. S.'s" remark with regard to wasps; for with us they are very plentiful, and are doing great injury to wall fruit. *M. W. Whitley, R N., York.*

*Rats,—How effectually to destroy.*—At page 552, occur some remarks having reference to this subject, that have caused us to receive an influx of letters and communications perfectly alarming. We had hoped, after the lengthened discussions which have appeared in this Paper, that the grand panacea for the destruction of the enemy was well known,—its efficacy undisputed. It would however appear that this is not the case. At all events, the subject having for some time slumbered, the remedy seems to have been forgotten. The name of the agent employed for killing these vermin is carbonate of barytes. The best place to purchase it, is at Dymond's, in Holborn. All chemists do not sell it. It must be the *powdered* barytes; and the commoner the better, for the purified article is ineffective as well as costly. A little of this must be inserted in the stomach of a fresh herring, or a soft bloater, and the whole manipulation must be performed with a piece of thin wood. The human hand must be dispensed with altogether, or sinister dealings will be suspected. Your train being laid, a few minutes will decide the matter:

"——— *Quid enim? concurritur: horæ*
*Momento* cita mors venit, *aut victoria læta!*"

If the latter, and the enemy triumph by their cunning (which, if you act with judgment, can hardly be the case), all future measures of *this* kind will be futile. It would be quite impracticable, and indeed unnecessary, to recapitulate here *all* that has before been so fully discussed. By reference to the *Gardeners' Chronicle* of January 12, February 9, and March 16, 1850, the desired information will be readily obtained; and if the principle of action therein recommended be fully carried out, the destruction of the enemy is certain. All I would add is—the necessity that exists for caution in the manner of distributing and preparing the weapons of war. The astuteness of the animal to be destroyed; his instinct, removed hardly one degree from reason; and his extreme wariness,—must be kept prominently in view. If he has cause, however slight, to suspect treachery, farewell to all success with the schemes that may have been concocted for his ruin! Your measures must be well taken, and acted upon promptly. Under no circumstances whatever must you be making any ostensible preparations. Anything out of the usual way would cause the intended victims to "smell a rat," and you would be at once foiled in all your stratagems. Do all in this way, that has to be done, with closed doors; and distribute your little offerings of friendship over the garden with an apparent absence of all design. Thus alone can you hope to triumph. As I have myself, in times gone by, been so truly awful a sufferer by the depredations of these vermin, my sincerity will hardly be doubted when I bid God-speed to the exertions of the intending crusaders in this righteous war. Let it be "war to the knife!" say I,—"and may Heaven defend the right!!" *W. Kidd, Hammersmith, Sept.* 5.

*Gardeners' Troubles.*—The following is a verbatim copy of a letter we have just received, and which we submit to the consideration of our readers:—"Fearing within a few days I may be in a dilemma, and knowing you to be a friend to our profession, and more particularly when deserving your support, I apply to you. I have just acted as a judge at Maidstone Flower Show, and it may happen my judgment may be called in question, or at any rate may open persons' eyes, and raise curiosity to gain a sight of my garden. I must, therefore, deal candid with you, and thereby get your candid answer, for my knowledge in the profession is very limited, as will be soon seen in my garden, as the Red Spider, as they tell me, destroying all my crops, but I have fortunately got a neighbour who has spared me a few Melons; and my greenhouse plants wither and die off as I think from improper soil, and indeed I have not now it is summer, a single plant in it, or Combs, or Balsams, or Achimineas. Now do you hold with giving water to bedding plants? for mine are dead before the late showers; and my Roses, Dwarf and Standards, look queer (all) say 250 sorts, only because I cut them with shears. And last winter I cut down a Laurel hedge with a saw and hatchet, and now it is horrid ugly, as the saw cuts are all turned black, and the wounds of the hatchet gape open and crack, and many stools dead. In fact, I must say the garden is not like the same place since I first came, and my late mistress, being no more, who did not mind spending 15*l.* or 20*l.*, I fear my master will marry again, and I may have then a mistress who knows more about gardening, and lose my place, or some of the curious may now come and call here. Will you please say how, and give instruction, that I may keep it, and avoid exposure, either for myself or the nurseryman who got it for me? I confess I do not know fruits, say Pears, as they seem all alike to me; and what is meant by succulent plants; and please describe colours of flowers, and how to propagate them. I am friendly with many gardeners, and hope to gain knowledge, but I hear behind my back they laugh, and wonder how I have kept my place so long. And our old cook is always grumbling, that she cannot have what vegetables she wants, and yet I get lots of Cabbages given me by cottagers. I could ask and say much more, but I will write again when you have answered this to correspondents. *A.*"

*Cuthill's plan of growing Potatoes.*—About three or four years ago you had a notice of this plan of managing Potatoes in your Paper, which induced me to try the system. I set about measuring the land intended to be planted, in the autumn, and to select the sets required for planting. Having plenty of loft room, well supplied with light, I placed my sets regularly above the floors, with the eye end upwards. They remained there until the beginning of the following March, by which time they had made bold stout eyes, some of them as large as the top of my finger. The tubers were then planted according to Mr. Cuthill's plan, and a more healthy and better crop I never saw. I have continued to prepare as many sets as I have had room for ever since, and I have never had a diseased tuber from those prepared in the manner alluded to. Mr. Whiting is quite mistaken in regard to rubbing off the sprouts before they get long enough to abstract nutriment from the tubers. They are suffered to sprout as little as possible, in order that they may thereby shoot forth more vigorously when planted, and produce an early and healthy crop prior to the usual time in which the disease makes its appearance. I purchased Mr. C.'s pamphlet after the first year's trial, and I found it to contain many useful hints which every gardener ought to put himself in possession of. *B. Fielder, gardener, Arlebury, Alresford.*

*Hedera Rœgneriana.*—Permit me to refer to the notice of Messrs. Veitch's new plants, at page 579, and do justice to Hedera Rœgneriana, by ranking it as a species and not as a home-raised variety. The Imperial Botanic Gardens of St. Petersburgh and Mikita distributed it with other plants indigenous to the Caucasus. *J. N. H., Edinburgh.* [We cannot find this Hedera mentioned in any work on systematic botany; and we should be very much obliged to you for further information. Where is it described?]

## Notices of Books.

*Hunt's Handbook to the Official Catalogues of the Great Exhibition.* 2 vols. small 8vo. London: Spicer and Clowes.

It would have been a great advantage to the visitors to the Crystal Palace, if this excellent guide had been ready when the Exhibition first opened. The difficulties attendant upon the operation having rendered that impossible, we may, at least, congratulate the public upon the completion of the work before the close of the stupendous undertaking. There are still three weeks in which Mr. Hunt's remarks may be profitably studied; and when the Exhibition has finally closed, his terse and instructive pages will form one of the best records of what it contained.

We learn from the preface to the second volume that, in the multifarious subjects treated of in these volumes, Mr. Hunt has received important assistance, Professor Forbes having taken in hand the vegetable and animal kingdoms, Professor Wilson the agricultural implements, Mr. Joshua Trimmer agricultural produce, Professor Gordon machinery, Capt. James military engineering and arms, and many other subjects having been specially written by very competent persons. This gives great value to the work, and renders it an indispensable companion to the Illustrated Catalogue and the jurors' reports. A few examples will show how the editor and contributors have fulfilled their tasks.

"*Pumps.*—There are several centrifugal pumps which, from the splash they make, attract the attention of every one. They are termed centrifugal pumps, but centripetal pumps would be more appropriate, for the water goes from the outside to the inside, or centre, of the bottomless bucketed wheels which form the forcing instrument or pump. These 'centrifugal pumps' are, in fact, inverted turbines—inverted Barker's mills. They produce a very low useful effect, and are only convenient for special application. The Archimedean screw, properly constructed, is the best 'pump' for raising a large quantity of water through a small height, as for engineering purposes, in clearing foundations, &c.; and the solid plunger-pump is the best for raising water to great height, as in mining and in numerous other cases."

"*Corks.*—The Hollow Corks and Combination Stoppers of the same exhibitor are constructed for bottles having a peculiar neck; a ring of cork fits into this, in which is placed a glass or stone-ware stopper. The principle of stopping or closing the orifices of bottles or other vessels with the substance so well known and so universally approved as cork is well understood. Nevertheless, the present method of its application is open to many objections, the enumeration of which will serve to illustrate the superior advantages that the new invention and application of hollow corks present; and as a superior effect is produced, and no new material used, their introduction is not calculated to excite any antipathy on the part of those persons who are in favour of the present or solid corks. The application of hollow corks in reality improves upon the principle of applying solid corks, and it is hoped; that their superiority will remove the disadvantages which have hitherto existed; among which, it will be remembered, that the solid corks are often difficult to extract, and, when pierced with a corkscrew, if only a portion of the contents is required, are with difficulty reinserted, made liable to leak, and no longer effectually exclude the air; in the act of drawing with a corkscrew, they often break in many pieces, and as the fissures in all cork contain dust, its presence and flavour are a disagreeable addition to the contents of the bottle.

"*Canadian Agricultural Produce.*—But though

Canada offers few temptations to embark capital in agriculture with the view of supplying the English market with Wheat, it offers to the small farmer and agricultural labourer the prospect of comfort and independence. The wages of farm labourers are as high in Canada with board as they are in England without it. 'A labouring man,' says the writer we have before quoted, 'may work all his life in the United Kingdom, and never acquire 50 acres of land; while five years of such labour in Canada, if he will avoid spirituous liquors, will enable a labouring man to acquire 50 acres, if not more, with a dwelling.'* Wheat is the first crop which the settler takes after clearing the land. The poorer class of settlers repeat that or some other cereal crop. Those possessed of some capital adopt the better plan of sowing the land down with Timothy-grass, and letting it lie under pasture five or six years, till the stumps are thoroughly rotten, when it may be ploughed and brought under a regular rotation. Turnips are but little cultivated, because of the early period at which the winter sets in, and the difficulty of preserving them in large quantities. The chief dependence, therefore, of the farmer for winter food for his cattle is on hay, of which the Timothy-grass produces about 1½ ton to the acre. Butter and cheese being produced with so much less labour than grain, and containing a much greater value in the same bulk, appear to be the most profitable application of land in countries like Canada, where labour is dear and markets remote. It is probable, therefore, that many of our small dairy farmers, who find great difficulty with present rents and present prices, in making both ends meet, would improve their condition by emigrating to Canada, and purchasing partially-reclaimed farms to be kept chiefly in pasture, and raising only so much grain as might be required for their own consumption. To these, as well as to the labouring classes, the system adopted by the Canada Company offers great facilities for acquiring land."

"*Austrian Percussion Caps.*—The total manufacture of percussion-caps for sporting guns in Europe may be estimated at 1300 millions yearly. Some idea of the importance of this article may be formed from the quantity of copper requisite for its production, viz., 396,000 lbs. weight. The great advantages of the new system have been so generally acknowledged that within the short space of 20 years all kinds of guns with flint-locks have been abandoned, and the percussion system has likewise been extended to muskets for the army. The percussion-caps of their manufactories are distinguished by accuracy and equality of bore, by the malleability of the copper, by the superior quality of the powder, the exact adjustment of the proportions, so as to insure certainty of ignition without danger of accidents, and by lowness of price, when the quality is considered. The percussion-caps coated with varnish may remain in the water for 72 hours and more without losing their power of immediately igniting the powder."

"*Chick Peas* (Spain)—Chick Pea (Cicer arietinum) is a stiff branching plant (see the Lawson collection), about 2 feet high, producing small red or white flowers, followed by bladder-like pods, containing three or four seeds of a whitish colour, about the size of common Peas, globular, and irregularly indented on the surface. When roasted it closely resembles coffee, for which it is often used as a substitute in the south of Europe. A native of countries where the winter is not severe, it is sown in the autumn, but is too tender to endure the rigour of that season in our climate, and scarcely reaches maturity during the summer."

---

*Ward's World in its Workshops* (Orr and Co.) is another meritorious guide worth preserving; well written, but with a much narrower scope than Mr. Hunt's, and excluding all notice of raw materials; it, however, embraces a slight notice of agricultural implements, evidently drawn up by some one far from conversant with their use.

## Garden Memoranda.

HORTICULTURAL SOCIETY'S GARDEN, TURNHAM GREEN.—Several matters are now in progress here, which may be worth mentioning. The reserve house in the "private square" has been painted and furnished with a new stage, previous to the reception of plants for the winter. The large curvilinear stove is about to be painted and cleaned. The horse-shoe boiler, two of which have served to warm the "old Pine stove," during a period of 28 years, having become worn out, is now about to be replaced by a boiler of a new description by Messrs. Bailey, of Holborn. The latter is a circular flue boiler, the flues (two), running round it horizontally, being formed by means of the brickwork in which it is set, and of grooves or indentations in the side of the boiler itself, which is hollow, in order that the fire may act in its centre. It is made of cast-iron, with a wrought-iron lid bolted on it. Its presumed advantages are, that it is more economical than other boilers in its consumption of fuel, as a large heating surface is exposed to the fire, not only in its centre, but also in the flame playing round the flues. It is small in size, and, as it therefore contains comparatively little water, it heats speedily. The cover is furnished with a "man hole," and a pipe called "the combustion pipe," for the double purpose of conveying the smoke that passes up the centre of the boiler to the chimney and for creating a draught. It is put in for trial, and there seems no doubt that it will answer well. The small greenhouse adjoining the stove just mentioned has been heated for about eight years with Garton and Jarvis's Exeter double drum boiler, a sort which has given great satisfaction both as regards economy and efficiency. Latterly, however, the hollow legs which supported the drum have given way, and a slight leakage was the consequence. These have been replaced by new ones, the boiler re-set, and it is expected that it will now prove as good as ever it was, and last for many years. This kind of boiler may not perhaps be capable of warming large houses, but for ordinary greenhouses and small stoves, none beats it. In the garden it heats a good-sized greenhouse and a range of pits.

As regards plants, few annual climbers look better than Lophospermum erubescens; and it covers a bare piece of wall in a very short time. It is now beautifully in bloom here on a north wall. Buddlea Lindleyana is in flower on the end of the Orchid house, and near the same spot is the handsome Indigofera decora blooming on rock-work, where it has stood unhurt over three winters; it is however in a sheltered place. Roscoea purpurea, a pretty Indian Gingerwort, which was in blossom in the greenhouse, would probably also succeed on rockwork where the roots could have a little protection in winter, and many other interesting plants at present considered tender, managed in this way might look very interesting. One of the finest greenhouse climbers we saw was Mandevilla suaveolens, which has been producing its snow-white flowers for some time past, and it looked as if it would continue in beauty during the most of September. One of the hardier Passion-flowers related to cœrulea was also in blossom on an adjoining rafter. The large Lælia superbiens in the stove, which has bloomed so finely these two or three years past, is again throwing up flower-spikes, and it promises to be as handsome this year as formerly. In a little frame in front of the Orchid house, where dwarf Cacti thrive and blossom well, Oxalis Bowei is just coming into bloom; and, certainly, few plants look gayer during September and October. Its round rosy flowers, fresh, and larger than a shilling, have a cheering effect, when most things out of doors are hastening to repose, and make it well worth attention. Associated with the Californian Ceanothes in an open frame, was a fine bush of the Evergreen Plum of that country. It is very handsome, independent of what fruit it may produce, and is undoubtedly a great acquisition. The "old Pine stove" alluded to above, is very gay with Achimenes and other plants, which will be soon replaced by Begonias that are coming forward in a pit to succeed them. The latter will keep up a blaze of flower throughout the winter. The Brugmansias in the large conservatory, and some other plants that had attained great size, have been pruned in, and are being painted over with a mixture of clay, tobacco water, soft soap, and sulphur, in order to clear them of insects. The Araucaria Cunninghami here has ripened cones; they are large and very handsome.

With regard to the new flower garden, we understand that Messrs. Waterer's Rhododendrons, which have been so much admired during the past season, will soon be removed, and that it is about to be replanted with flowering shrubs (among which the Rhododendron will still hold a conspicuous place), and herbaceous and other plants, the object being to maintain as much gaiety as possible throughout the whole year. This work will, we believe, be proceeded with as soon as the ground is cleared of its present occupants. The Arboretum is at present in excellent order. The Grass is delightfully short and soft, and the recently formed beds on the east side are quite a blaze of gay flowers. The "Birch clump" is being cleared of its underwood, with a view not only to increase the Grass surface, but also to improve the general appearance. The Hornbeam Hedge which separated the walk and borders, running down past the council-room from the Arboretum, has been removed; the Rhododendrons which have been encroaching too much on the small walk opposite the council-room window, are to be set back, the walk is to be furnished with Grass verges, and the borders are to be lowered in order that water may run off the walk, and thus render the latter dry. The principal walks are everywhere well gravelled, clean and nicely rolled, and the Arboretum altogether appears to be much improved.

Among new plants raised are some from Californian seeds. They consist of a shrubby Spiræa, said to have pink flowers; a Philadelphus, with spikes of white blossoms, said to be fragrant; some purple and white flowered bulbs, a white Lupin, a shrubby Pentstemon, reported to attain a height of 3 feet, the blooms being white and purple, and produced in early spring; a blue Pentstemon (apparently a Scutellaria), Erysimum Arkansanum, stated to reach 3 feet in height, and to be more beautiful than E. Peroffskianum; and some other plants, whose true characters it will require some time yet to prove. A few Russian and New Holland plants have also been raised, to which the same remark applies. Among the former may be mentioned Araucaria Cookii, an interesting kind in the way of, but distinct from, A. excelsa. A quantity of Oaks, said to be evergreen, has been raised from seeds received from Koordistan. They are nice plants, and will soon be ready for distribution.

In one of the Vineries we observed the Chasselas Musqué Grape nearly ripe, but not split, as is customary with it. This is prevented by keeping the border in an equable state. If the latter is permitted to become too dry, and suddenly saturated with water, the fruit is sure to split. The same thing happens with Plum in certain stages of growth, on the occurrence of much wet after drought. Reeves' Muscadine was bearing largely. It is a Cape Grape, of good quality, and a certain bearer. A good crop of Peaches has been secured on the wall, coping boards having been the chief protection in spring. Among the varieties was the Shanghae Peach, introduced by Mr. Fortune. It resembles the Late Admirable, and is very good, but hardly adapted to our cold springs. It is reported to succeed admirably in the climate of Paris. Ripened there the fruit is said to be delicious. The Pucelle de Malines and Malta Peaches are both good kinds. The latter is, however, rather a shy grower. The Impératrice and Balgowan Nectarines are worth attention. If the former is allowed to hang on the tree till it shrivels, it is very rich. Some fruit of the latter, which is like the Violette Hative, measured 8 inches in circumference. We also remarked Denyer's Victoria Plum, which is identical with the Alderton, a place in Sussex, where old trees of it are growing. Apples are a tolerable crop. They are better on standards than on dwarfs. Pears have been much thinned by the spring frosts.

Among Apples in the fruit room, we remarked the summer Golden Pippin, a first class variety; Reinette de Laak, a handsome sort, something like the Golden Reinette, but rather more Pearmain shaped; the Gravenstein, tolerably perfect notwithstanding our cold season; Kerry, Oslin, and Wormsley Pippins; the latter is a good Apple, both for kitchen and table use. Associated with these was also a little-known Apple called Baleborodova, a Russian variety, large, ovate, red next the sun, and bearing a delicate bloom like that of a Plum. It is a fine looking Apple, with an agreeably brisk flavour.

Among vegetables in the kitchen garden we must not forget to notice the Neapolitan Cabbage Lettuce, which many persons consider preferable to the Malta. It is sweet and tender, and very long in running to seed. The Early Ulm Savoy is a nice variety, more especially for small gardens, as it occupies little room. It is very dwarf and compact. It was planted last year on a piece of unmanured ground, and was very fine; but this season the land was manured, and it has not been quite so good, being taller and scarcely so firm. It would seem to prefer only a moderately rich soil. The Enfield Market Cabbage, (some account of which is given at p. 69), is found to be an excellent kind. It resembles a large Vanack, to which it is apparently nearly related. Chou joannet is dwarf, compact, and good; it is as early as the Early York. Chou pointu de Winnigstadt is a good late Cabbage, and very tender. Among Turnips, the Navet jaune de Finlande is an excellent sort. It is thin skinned, and has a very small tap root. The latter is one of its greatest recommendations. Haricot Solitaire will be found useful, on account of its standing dry weather well. It is green, and fit for use now, when other sorts, sown at the same time, are quite ripe.

The reading-room was reopened on the 1st of August. Three prizes having been offered by Dr. Lindley for the best plans and measurement of a piece of ground staked out, the clumps, belts, houses, or principal trees being indicated, they were found to be due to Buchan, 1; Wells, 2; and Williams and Elworthy equal, 3. The prizes consisted of the new edition of "Loudon's Encyclopædia of Gardening," "Annals of Horticulture for 1849," "Babington's Manual of British Botany," and "Johnson on Manures."

It may be worthy of record that a frost on the night of the 10th inst. partially blackened the leaves of the Gourds and Scarlet Runners in the garden. Some other things have also been injured.

## FLORICULTURE.

ROYAL BOTANIC SOCIETY'S SCHEDULE FOR 1851.—My last week's prospective notice of a few divisions of the Horticultural Society's Schedule for 1852 having met with the expressed approval of many florists, I propose this week to "try back," and offer a few remarks on a Schedule of 1851. Who can blame me if I linger among the bygones of a year so memorable as this one, which has proved so gratifying, not only to Englishmen, but to the various civilised nations of the earth. Need I remind my readers how every lover of a garden, and especially of a greenhouse, will look back on 1851 as the bright jewel of the nineteenth century, when the world's architects were defeated, and put to shame by a Paxton, when he who had exerted his talents to provide for the accommodation of the "Queen of Lilies," was enabled to rear a Crystal Palace to admit the contributions of the world, and display them before the admiring gaze of our Queen, her people, and her guests. Lingering, then, I repeat it with pleasure amid the now almost bygones of 1851, I wish to make a few observations on the schedule of the Park for the past season, with the hope that the Council may take into consideration the evil of which I now propose to complain; an evil which is not less prejudicial to the interest of the dealer than it is discouraging to the energy of the private grower, and which makes both parties discontented and dissatisfied. I feel thoroughly convinced that I am but declaring the unanimous sentiments of the whole body of florists, when I state that there was a grievance, an old grievance, in that schedule which needs a remedy. In that schedule separate classes were provided for dealers in, and private growers of, stove and greenhouse plants, of Cape Heaths, of Azaleas, of Orchids, of Pelargoniums, and of cut Roses; yet no such division was made with respect to Pansies, Pinks, Picotees, or Carnations—objects, in

* "The Emigrant to America," Blackwood and Sons.

their way, as attractive and as generally admired as are the finest productions of our stoves and greenhouses; as has been well observed by no mean authority in floricultural matters "even Royalty had been known to dwell in admiration longer over a stand of well selected Pansies, than over the rarest horticultural specimen of an exhibition." I will briefly point out the actual injustice of the case, though it is so apparent, that little comment is needed. By this arrangement of the schedule we have the buyer and the seller brought into an unwise antagonism. Fair competition is the thing to be aimed at in every exhibition, and one would suppose that if it be necessary to separate dealers from amateurs in the productions already enumerated, so as to produce a fair competition, then surely the same necessity must exist to treat our florists' flowers upon the same plan, with such a separation. I am thankful to admit, on behalf of every lover of floriculture, that the schedule of 1852 needs only to be a second edition of that noticed at the head of this article. I am unable to discover any reasonable ground for the continuance of this unnecessary collision between the buyer and the seller; it tends to keep the grower from exhibiting, for fear of disgusting his customer; it tends to keep the purchaser from exhibiting, because he knows that he cannot, for many reasons, attain to the same pitch of excellence as his opponent; nay, more, it will keep many from purchasing and growing flowers which they have no opportunity of bringing forward to a fair competition. It may be said that, what reasons are there why an amateur should not grow as good a stand of Pansies as a dealer? I answer there are many; for instance, the amateur can never have so great a variety to choose from as the dealer, who is obliged to test every variety that is put forth in each year by the principal raisers; it will be hard if from these he does not obtain some improvements on the sorts in the hands of private growers. No amateur can venture to buy everything in this fashion; he must look to the advice and recommendation of one or two growers of note, when they have proved the previous year's lot; this necessary process must always throw the amateur one whole season behind the dealer; reasons such as these might no doubt be multiplied, were they necessary. With this alteration will be seen an increased number of exhibitors. The only reflection likely to arise in the mind of every florist, upon considering this subject, will be one of unmitigated astonishment, that so palpable an evil to the true interest and progress of floriculture should have so long existed. I shall be thankful if what I have written should in any way tend to produce its removal. Let the floricultural motto for 1852 be, "A fair field and no favour." *J. E.*

THE DAHLIA EXHIBITIONS for the season will be pretty generally brought to a close during the coming week; it will be my duty to attend those enumerated in the "List of Meetings," at p. 595, viz., the North London (Highgate), on Wednesday, and the Stoke Newington on Thursday. The usual classes have been instituted at both places; dealers, 24 varieties and 12 fancies; amateurs, 12 varieties and 6 fancies. I also observe that at Highgate, Hollyhocks, Fuchsias, Verbenas, Antirrhinums, and Petunias are invited, together with several classes of extra prizes, making a varied and attractive schedule. I hope to be able to furnish reports which, without being too elaborate or irksome, may yet serve the purpose intended, viz., a record of the leading flowers, together with notices of all novelties, to which undivided attention shall be directed. *J. E.*

## NOTICES OF BOOKS (FLORICULTURAL PORTIONS) FOR SEPTEMBER.

*The Midland Florist* has an article by the conductor, on "How Tulips are judged in the Midland Counties;" "On Auriculas, by Mr. Lightbody," accompanied by a descriptive catalogue of some known high class flowers, and of others little known in the south; and a report of the Midland Horticultural Society's Carnation and Picotee Exhibition. The latter will be found valuable as a reference.

*Beck's Florist* has a plate of, and some remarks on Gladioli. *The Monthly Remembrancer* contains the best information on the culture of Florists' Flowers, and is as it implies, a remembrancer, on which all may rely. "Orion" continues his running comments on "The Progress of the Pelargonium" in the *Floricultural Cabinet*. *The Gardeners' Magazine of Botany* contains a few brief cultural remarks on Floriculture.

# Societies.

NATIONAL FLORICULTURAL, *Sept.* 18.—Several nice Hollyhocks were shown. A first-class Certificate was awarded to Mr. Bircham for Model of Perfection, a pale primrose flower of fine form and texture, guard petals smooth, centre well proportioned. Ditto to Pourpre de Tyre (Bircham), a rosy purple sort, and one of the best of its colour. Certificate to Penelope (Bircham), deep rosy pink, large and fine, guard petals smooth, centre not sufficiently elevated. First-class certificate to Mr. Parsons, Ponder's-end, for Safranot, a desirable pinkish salmon-coloured variety, with buff guard petals. Ditto to Pillar of Beauty (Parsons), a bright rosy crimson flower of fine form. Ditto to Triumphant (Parsons), a pale primrose kind, occasionally tinted with delicate rose. The above were all shown in spikes. Among Dahlias, a first class certificate was awarded to Mr. Turner, of the Royal Nursery, Slough, for Miss Ward, bright lemon, with tips of pure white, a decided improvement on Mrs. Hansard. Ditto to Morning Star (Turner), orange suffused with scarlet, fine in shape, and certainly an improvement on Earl of Clarendon. Certificate to Mr. Keynes of Salisbury, for Una, a good white. Ditto to Mr. Rawlings, for Sir F. Thesiger, a rosy lilac flower, which has been favourably noticed by us on former occasions.

THORNBURY, NEAR BRISTOL.—The Cup, Mr. Turner; 2d, Mr. Sealey; 3d, Mr. Maul. Amateurs: 1st, Mr. Liddiard, Bristol; 2d, Mr. Fisher, Bath; 3d, — Walters, Esq., Gloucester. Mr. Turner's blooms were certainly the finest he has ever put up. Such 18 flowers could scarcely have been selected from the Surrey and Shacklewell, fine even as they were there. They consisted of Sir R. Peel, Queen of Dahlias, Radziville, Thames Bank Hero, Snowflake, Duke of Wellington, Sir C. Napier, Goliath, Lady Cathcart, George Glenny, Mr. Herbert, Mr. Seldon, Fearless, Cobden, Miss Spears (Lamont), John Edward, Andromeda, and Grenadier.

CAMBERWELL AMATEUR DAHLIA, *Sept.* 15.—This is the third year in which this Society has held a show, which is principally supported by Surrey amateurs; the system adopted here is "cut and cut;" viz., Mr. A. sees Mr. B. not only cut the blooms to be shown, but seals up the box, which must only be opened in the presence of Mr. B. Mr. C. does the same thing for Mr. B., and so on by all the members, one to the other. On the present occasion, the exhibition was held in the Lecture Hall. For 12 blooms, Mr. Marshall, Norwood, obtained the 1st prize, with Buffalo Girl, Beeswing, Carmina, Mrs. Shelley, Sir F. Bathurst, Earl Clarendon, Richard Cobden, Privateer, Seraph, Black Prince, Duke of Cambridge, and Captain Warner; 2d, Mr. Noake, Camberwell; 3d, Mr. Connell, ditto. 9 blooms: 1st, Mr. Attrill; 2d, Mr. Kershaw; 3d, Mr. Morris. 6 blooms: 1st, Mr. Larkin; 2d, Mr. Willis; 3d, Mr. Champion; 4th, Mr. Atherton. As an open prize to private growers, a silver cup was presented by Robert Donald-on, Esq., through the Society, for the best 12 blooms. For this 4 collections were produced: 1st, Mr. Hunt, jun., Paddington, with Duke of Wellington, Mr. Seldon, Princess Radzivill, Earl Clarendon, Sir F. Bathurst, Queen of Lilacs, Sir R. Peel, Honourable Mrs. Ashley, Shylock, Louis Philippe, Yellow Standard, and Gem of the Grove; 2d, Mr. James; 3d, Mr. Prockter; 4th, Mr. Black. Mr. Bragg had a large collection of Dahlias, Hollyhocks, Pansies, and other cut flowers; Pansy Pandora (Hunt), and Fancy Dahlia Miss Mathews, were both in good condition. Verbenas, Fuchsias, and other subjects were well supplied. *J. E.*

NOTTING HILL DAHLIA, *Sept.* 16.—This exhibition was held in Ladbroke-square. The day was fine, and the company numerous. First-class certificates were voted to George Villiers (Union), a dark ruby variety of much merit; the specimens were only, however, of moderate growth; to Triumphant (Keynes), a flower formerly noticed by us; to Laura Lavington (Keynes); to Nancy (Keynes); to Morning Star (Turner), deep orange scarlet, bold; to Miss Ward (Turner), a pale yellow, tipped white; to Miss Mathews (Bragg), brilliant scarlet, tipped white. Other seedlings were shown—Una (Keynes), a bold white; Flora McIvor (Keynes); Phantom (Noaks), golden orange; Sarah, mottled lake and white; Duchess of Gloucester and George Long (Trenfield); Malvina (Turner), bold purplish lake, mottled. Amateurs, 12 blooms: 1st, Mr. Weedon, of Hillingdon, with Mr. Seldon, Nil Desperandum, Magnificent, Duke of Wellington, Sir F. Bathurst, Admiral, Snowflake, Anticipation, Elizabeth, Yellow Standard, Grenadier, and Earl of Clarendon; 2d, Mr. Hunt, jun., with Magnificent, Earl of Clarendon, Princess Radzivill, Duke of Wellington, Sir R. Peel, Elizabeth, Mr. Seldon, Sir F. Bathurst, Yellow Superb, Shylock, Fearless, and Yellow Standard; 3d, Mr. Prockter, with Duke of Wellington, Thames Bank Hero, Mrs. C. Bacon, Richard Cobden, Fearless, Snowflake, Purple Standard, Crocus, War Eagle, Captain Warner, Mr. Seldon, and Scarlet Gem; 4th, Mr. J. Edwards, with Snowflake, John Edward, The Hero, Mrs. Seldon, Regina, Thames Bank Hero, Earl of Clarendon, Negro, Richard Cobden, Fearless, Mr. Seldon, and Queen of the Isles; 5th, Mr. Cook; 6th, Mr. Jones; 7th, Mr. Hopkins; 8th, Mr. Chawner. Six Fancies: 1st prize to Mr. Black, with Elizabeth, Rachael, Mrs. Hansard, Miss. Compton, Madame Wachy, and Forget-me-Not; 2d, Mr. Jones, with Miss Compton, Highland Chief, Madame Rose, Floral Beauty, Lady Grenville, and Madame Bresson; 3d, Mr. James, with Miss Compton, Mrs. Hansard, Elizabeth, Gasparini, Madame Wachy, and Mrs. S. Lefevre; 4th, Mr. Edwards, with Mrs. Hansard, Highland Chief, Princess Helena, Forget-me-Not, Kingfisher, and Gasparini; 5th, Mr. Chawner. Six new varieties: 1st prize to Mr. Weedon, with Nil Desperandum, Lady Cathcart, Regina, Admiral, Jullien, and Model; 2d, Mr. Black, with Goliath, Queen of Beauties (extra fine), Leda, Nepaulese Prince, Yellow Superb, and Sir C. Napier; 3d, Mr. Edwards, with Admiral, Leda, Regina, Nepaulese Prince, Napoleon, and Sir C. Napier; 4th, Mr. James; 5th, Mr. Jones. Four new varieties sent out this season by Mr. Keynes: 1st prize to Mr. Black; 2d, Mr. James; 3d, Mr. Edwards; 4th, Mr. Pope; 5th, Mr. Jones: sorts, Yellow Superb, Mr. Herbert, Summit of Perfection, Beauty of Kent, Baltic, and Miss Pope. Four new sorts let out this season by Mr. Turner: 1st prize to Mr. Black; 2d, Mr. James; 3d, Mr. Jones: sorts, Nepaulese Prince, Goliath, Lady Cathcart, Sir C. Napier, Nil Desperandum, Jullien, Regina, Roundhead, Leda, Model, and Mr. Palmer. Dealers, 24: 1st prize to Mr. Legge; 2d, Mr. Bragg; 3d, Mr. Cook. 24 Fancies: 1st prize to Mr. Legge; 2d, Mr. Bragg: the sorts being those already enumerated. Hollyhocks and Pansies were produced by Mr. Bragg; and a neat collection of Roses by Mr. Wilkinson, Western Rose Nursery, Ealing; among the sorts were 18 bunches of that sterling variety Géant des Battailles, also La Reine, Safranot, Paul Joseph, Mrs. Bosanquet, Cloth of Gold, &c. *J. E.*

CALCEOLARIAS: *C J.* The leaves sent were so dry that no traces of the insect were visible. Try tobacco-water, and syringe the plants on the under-side of their foliage. *J. E.*

CARNATIONS AND PICOTEES: *Anon.* These will now be mostly rooted and fit to take off. *J. E.—B V.* It is Hale's Sir H. Smith, S. F.; we know of no other. *J. E.*

CINERARIAS: *A B, and T S.* The notes were made at the several exhibitions which occurred during the season. I have not been a grower of them, yet, like yourselves, I have a disposition that way; further, I have already "had in" a dozen, by way of beginning, and I advise you both to "go and do likewise:" their cultivation is by no means difficult, and from their early season of flowering, they prove valuable and interesting without being expensive. Obtain Adela Villiers, Amy Robsart, Blue Perfection, Carlotta Grisi, Cerito, Clementine, David Copperfield, Effie Deans, Electra, Flora M'Ivor, Jetty Treffz, Ladies Gertrude and Hume Campbell, Lettice Arnold, Madame Sontag, Wedding Ring, &c. Madame Sontag has pale green foliage, without any purple on the under side; Electra is a shade darker, slightly tinged with purple underneath; Lettice Arnold is of a still darker shade of green, but without the purple tinge—its habit is robust; these are also the characteristics of Jetty Treffz; Adela Villiers, Amy Robsart, Effie Deans, and Lady Hume Campbell are each distinctly shaded with purple on the under side of the foliage; Wedding Ring, Cerito, Lady Gertrude, and Carlotta Grisi, are of less robust habit than the preceding, yet all may be advantageously added to every collection. *J. E.*

DAHLIAS (Fancies): *H P.* It is probable that they will resume their proper character, if treated as you propose. At the best of times, Fancies are disposed to sport into Selfs; even those now complained of, as the season advances, and the soil becomes exhausted by their growth, will produce flowers true to their kinds. *J. E.*

FLOWER SHOWS: *Justice.* Yes; the 12 plants in no way interfered with classes; they were set up as "extra," and being considered worthy, were so rewarded, for which Rule 10 especially provides. *J. E.*

TROWBRIDGE SOCIETY: *J K.* Censors should not be biassed by the remarks of a manager or assistant; a casual observer seldom examines the flowers sufficiently to be able to form a correct opinion on their merits. I have, however, every respect for the gentleman referred to; he could not easily be deceived, and would be one of the last to dispute an award if rightly made. *J. E.*

## SEEDLING FLOWERS.

DAHLIA: Scarlet King is brilliant in colour and good in outline; it has the shape of the Duke of Wellington, and colour of John Edward. The specimens were much past their best.*

PANSY: *R B D.* A yellow-ground flower, in the way of Bellona. In its present state it is too coarse for the purposes of exhibition.*

# Miscellaneous.

*Potato Disease in Germany.*—A correspondent travelling in Northern Germany sends us the following:—"I think you will be painfully interested in hearing that throughout the north of Germany the Potato disease has made rapid progress. When I left London, a short time ago, fears were entertained for the crop in Ireland; but, so far as I am aware, no fears were then felt for the crop in the great Potato growing plains of the north of Europe. Within the last seven days, I have passed from Cologne to Berlin, through hundreds of miles of diseased roots, and in many places the decay was so far advanced as to make the atmosphere quite intolerable. Already the effect of the calamity is felt in the market price of food in these countries, and even in England it is next to impossible that its influence should not be serious. Few misfortunes could be greater than another general failure of this great staple; and those who have it in their power to take precaution, should bestir themselves in time. It is already bitterly cold in North Germany, and there is every prospect of a severe winter to aggravate the calamity." *Athenæum, Sept.* 13.

*Cement for Stone Ware.*—Gelatine is allowed to swell in cold water, the jelly warmed, and so much recently-slacked lime added as requisite to render the mass sufficiently thick for the purpose. A thin coating of this cement is spread while warm over the gently-heated surfaces of fracture of the articles, and let dry under a strong pressure. What oozes out is removed directly with a moist rag. *Central-Blatt.*, No. 31; *Chemical Gazette.*

*Eatable Plants of Panama.*—Several spontaneous productions are used as culinary vegetables. The Marathrum fœniculaceum, H. B. K., a plant resembling some of the finer sea-weeds, and growing in most rivers of Veraguas, is esteemed so highly by the inhabitants that they have called it Passecarne, *i. e.*, exceeds or surpasses meat; and, indeed, its young leaf-stalks, when boiled, have a very delicate flavour, not unlike that of French Beans. The leaves of the Nnaja di espina Pereskia Bleo, De Cand.) are eaten as salad either raw or boiled, like the young branches of several Opuntias in Mexico; and in a country where, from the nature of the climate, the rearing of Lettuces is attended with difficulties, they form a tolerable substitute. The foliage of the Jatropha multifida, Linn., affords another culinary vegetable, losing, apparently, as do must Euphorbiaceæ, its poisonous qualities by boiling. The shrub is always found in hedges and around dwellings, which leads us to suppose that it was originally introduced, a supposition to which its vernacular name, Col de Nicaragua, or Cabbage of Nicaragua, gives additional strength. The seeds of the Chigua (Zamia sp.), a plant abounding in the vicinity of Chirambira, after having been boiled and reduced to a mash, are mixed with milk and sugar, and thus eaten. A kind of bread is also prepared from them. As condiments for esculent purposes, divers plants are employed. The red berries of the Malagueto chico, or Malagueto hembra (Xylopia sericea, St. Hil.), are substituted for pepper, especially by the negroes, who seem to have imported the first part of its name from their native country. The fruit of the Vainilla (Vanilla sp.) and Vainilla chica (Sobralia sp.) are valuable spices, much employed in flavouring sweetmeats, chocolate, puddings, &c. The leaves of the Toronjil (Ocimum Campechianum, Mill.), a common annual, are chopped, and serve to replace our Parsley. The most important, however, of all the aromatics to the Panamian cook is the Culantra (Eryngium fœtidum, Linn.). It imparts a flavour difficult for a foreigner to relish; but the inhabitants consider it the *sine quâ non*, and are quite distressed when in the soups and sancoches their favourite herb has by some accident been omitted. *Hooker's Journal of Botany.*

# Calendar of Operations.

*(For the ensuing week.)*

## PLANT DEPARTMENT.

IN addition to making this department as gay as possible at this season, attention to cleanliness and order should be rigorously enforced, as the time is drawing near when this will be looked to as a principal means of affording gratification and enjoyment, in lieu of that which is rapidly disappearing from the open flower garden; and when attention is concentrated more exclusively upon the plant-houses, anything which is untidy or out of order will the sooner attract notice. Some nice good-shaped plants of hardy Rhododendrons, Azaleas, Kalmias, &c., which are well supplied with blossom-buds, should be taken up, potted, and plunged in a bed of ashes, from whence they can be brought forward in succession as they are required. Roses in pots for winter use should be examined, and any that require repotting or top-dressing should be immediately attended to; a little stimulus in the way of rich soil will be of great service to them. Attend to the staking of Chrysanthemums, and stimulate their growth by occasional waterings of liquid manure, removing all suckers as soon as they appear. Encourage the growth of Cinerarias, Primulas, Calceolarias, &c., by repotting them, as often as they require it, into light rich soil; and give them every other attention calculated to ensure a strong sturdy growth.

## FORCING DEPARTMENT.

PINERIES.—As long as the daylight is strong enough to keep the plants in a healthy growing state, great care should be taken to prevent them receiving any check

The night temperature should be kept steadily ranging from 63° to 68°, with a bottom heat of 85°. Examine carefully the wants of the plants, as regards water; avoiding either extreme, and syringing only in very fine weather, and then with water of the same temperature as the pits, taking care not to allow the moisture to accumulate about the stems and hearts of the plants, as considerable injury will be done thereby during very dull weather. Admit air freely in such weather, to assist evaporation, even if extra fire-heat is required to enable you to do so. VINERIES.—Vines intended for early forcing should be pruned as soon as possible, or they will be liable to bleed. The old loose rough bark should be rubbed off, and the whole of the plants washed over with sulphur and soft-soap. The glass should be cleaned, and all the interior of the house painted, taking every precaution to smother effectually insect life in every stage. The old worn-out soil should be removed from the surface of the border, as far as practicable without injuring the roots, and replaced with a rich compost of charred turf, fresh horse or deer dung, and lime rubbish, with a portion of rough bone-dust. CHERRIES.—The forced Cherries will now be losing their leaves, and should, with the house they occupy, be treated exactly as was recommended for the early Peach-houses some weeks back. MELONS.—Unless these can be freely supplied with top and bottom heat, thereby allowing the admission of a free current of air, they will be of little further value; and, as the fruit ripens, they may be cleared out, to make room for various plants during winter. Take care, however, of those growing in pits which are furnished with the necessary facilities for keeping up the requisite amount of heat.

### FLOWER GARDEN AND SHRUBBERIES.

Seeds should now be carefully gathered as they ripen, and due attention given to mowing, rolling, cleaning, &c. Short moderately hardened shoots of Hybrid Perpetual and Bourbon Roses, if taken off at their junction with the preceding growth, and placed in a slight bottom heat, will strike root easily, and if potted in rich soil, will come in admirably for flowering in pots during next spring or the following winter. It is now high time to plant spring-flowering bulbs, and the ground intended for them should be immediately cleaned and prepared for their reception. The soil in which they flourish best consists of a highly-enriched sandy loam. A more cheerful appearance may be given to the beds by interspersing them with some plants of the hardy Primrose or Polyanthus, or with small plants of Erica carnea from the reserve garden. These flower at the same time, and may also be returned to the reserve garden in April or May next. Many of the early flowering herbaceous plants being now in a dormant state, an excellent opportunity is afforded for removing them, if desired, or for increasing the stock by division, as they will commence rooting immediately, and will have time to establish themselves before the ground becomes locked up with frost. If it is intended to take up any of the plants from the open garden, and preserve them for filling the beds another season, it should be done early, that they may have time to start fresh before winter. The lifting will generally be confined to any new or very choice plants, of which there is not a sufficient stock of young ones; and to scarlet Geraniums, which produce flowers more abundantly upon old plants than upon young ones. The latter should be taken up, pruned to within one healthy joint of the old wood, and planted close together in pots or boxes. They should be placed in a moderately warm greenhouse, on a frame of the same temperature; and if the soil is moderately moist at the time of potting, water should be withheld till they have commenced to form new shoots and roots. Other beds may now be cleared of their occupants, wherever these are getting shabby or untidy in their appearance.

### FLORISTS' FLOWERS.

It will be necessary now to put Polyanthuses and Auriculas, grown in pots, into their frames for the winter. The most successful cultivator of these flowers we ever saw, had the whole of his pits made of brick-work, having two small sliding doors in each of the sides; by this means, in boisterous or rainy weather, he could secure a free ventilation amongst his plants, without moving the lights. As they will now be getting to rest, it will be advisable to avoid all undue excitement; in fact, they should be rather too dry than otherwise, giving all air possible, and by no means supposing that these plants are in any way tender, the greatest enemy they have is damp. Repot young plants in good compost, and attend carefully to seedlings. CARNATIONS AND PICOTEES.—Those that were layered early may be removed from the parent plants; if a new variety, it may be worth while to save the latter also; if cut down, they will emit shoots, and often produce a profusion of layers the succeeding summer. The layers which are now removed may either be potted singly in half pints, or two together in a pint; they should then be closely framed for a few days, shading from the sun, giving air gradually till they have emitted fresh roots, when they may be wholly exposed.—Tulips should now be arranged for planting, and offsets got in as soon as possible.

### HARDY FRUIT GARDEN.

WALL TREES.—Any over-luxuriant growth should still be pinched, to prevent any excess of growth in one part of the tree, to the injury of weaker branches. In late situations, Peaches will continue to grow for some time after this, especially if the season should prove wet; and to prevent this, when such a tendency has been observed, we have often at this season cut trenches round the trees immediately after the fruit has been gathered from early kinds. The trenches should be cut at distances proportioned to the size and age of the trees; and all the strongest of the roots cut back with a knife, to check any exuberant growth, and to promote the ripening of the wood. This plan has answered fully. The cut roots soon emit new fibres, and the trees improve amazingly by it. Our borders being concreted below, enables this operation to be more readily performed than it could be if the roots were allowed to descend deeply into the subsoil. The late Peaches cannot be root-pruned till after the fruit is gathered; but all that require it should be attended to as soon as circumstances will permit. The best way to protect fruit from wasps is by means of the hexagonal gauze net, as formerly recommended. Pears and Apples will require frequently examining during the next few weeks, so as to gather the ripe fruit before it falls from the trees.

### KITCHEN GARDEN.

Any crops of Potatoes still remaining in the ground should be got up without delay, carefully sorted, and slightly sprinkled with quick-lime, or the caustic ash produced by charring or burning refuse; a good plan to ensure perfect dryness is to fill up the crevices between them with dry charcoal dust, which will absorb any moisture exhaling from the Potatoes. But as this does not prevent their heating, we prefer to keep them as dry and cool as possible, by passing a current of air through them. Avoid the too common large heaps, in which the Potatoes become very hot, and are much more likely to become diseased. The best way is to store them in small heaps, containing from 8 to 12 bushels in each; and, as an additional precaution against their heating, a few draining pipes may be laid round the edge, pointing towards the centre, by which air will be admitted on all sides; and the egress of the vapour may be provided for by fixing a single pipe upright in the centre of the heaps. They should be formed on the surface of a dry piece of ground, which is much better than to dig pits for them. They should at present be only partially covered, laying over them sufficient straw and soil to exclude and throw off the rain, but deferring their frost-proof casing of soil till the nearer approach of winter. In addition to the rows of Parsley planted at the foot of the south walls, a few boxes should be filled with some carefully selected plants of extra curled, to afford a supply in extraordinary cases during winter, when deep snow or other causes prevent access to the plants in the open ground.

State of the Weather near London, for the week ending Sept. 18, 1851, as observed at the Horticultural Garden, Chiswick.

## Notices to Correspondents.

A GARDENER: *O P.* On no account whatever alter your position; keep your money, keep your place; for you may depend upon it you are more independent now than you will find yourself if you embark in market gardening or other speculations in this country.

BIRDS—LINNET AND CANARY: *Mary T.* Yes; we advise you to separate them immediately. When separately caged, hang them so that they can hear but not see each other. Your idea that they will again "pair" next season, is founded in reason; seeing how happy they have been in the united state, and how affectionately they have reared their offspring. A bird's memory is tenacious, though sometimes his disposition is capricious. *W K.*—THE ROBIN: *B G L.* You are right. No finer cage-bird exists than a robin—whether for beauty or for song; and if properly fed and attended to, they will sing nearly the whole year through. All they require, beyond their regular food, is a meal-worm now and then; and occasionally a little sliced liquorice root in the tin holding their water. *W. K.*—THE YELLOW-HAMMER: *Jane D.* This is a cheerful bird in confinement; and as you have had him given you, there can be no reason why you should not keep him. He is a bird of handsome presence, but will not sing in a cage till next spring. He will eat German paste as well as Canary seed. *W. K.*—THE NIGHTINGALE: *Penelope.* No; they are yet tarrying with us, being reluctant to depart until compelled by adverse weather. The tame Nightingale, alluded to by us in earlier Numbers, is still with his mate in our garden. They have raised a second brood, which are full fledged; and the papa treated us to a short hurried snatch of song on Sunday last. Surrounded by his family, he was an object of great interest to more than one beholder. *W. K.*—THE WREN: *S P G.* This bird *must* be fed on liver gentles, or live food. It never thrives on German paste only. If so treated it will pine and die. *W. K.*—THE THRUSH: *Ellen A.* You have acted unwisely in placing a cup of water in the cage. All birds of this tribe are mischievous, and upset every vessel within their reach. His sand has become saturated with water, and he has caught the cramp. Being so young, you must keep him in warm quarters, and let him have plenty of small dry gravel for a carpet. *W. K.*—THE GOLDFINCH: *J Y.* You may keep them together while they are so young, but it will be advisable to separate them in about three weeks. All birds sing better and sooner when in "a house of their own." *W. K.*—THE CANARY: *Amanda.* We have no difficulty in divining, from the tenor of your gentle note, that you are a very kind mistress; we therefore give you every hope of your invalid bird soon rallying, and repaying you with a grateful song. We are glad to have in any way assisted you by our advice, so promptly acted upon. Cease giving him green meat, Saffron, and Hempseed. If medicine be at any time needful, administer it in the agreeable and equally efficacious form of (warm) boiled milk. Remove the bird's water, meantime, for two days. *W. K.—Eleanor B.* Your little canary has been taken too early from the breeding cage. You must treat him now like a hot-house plant; place him in a close cage, and keep him warm throughout the winter. Do not attempt to hang him up, as you propose, out of doors—even though "the sun shines." *W. K.*—THE BLACK-CAP: *J B.* Thanks for your note. From what you state, there can be little doubt that your "household gods" will soon be rejoicing in the united harmony of the nightingale and black-cap's notes. It is remarkable that the latter bore the fatigue of such a long journey so well as he did, and that he is already so sprightly. Read carefully what we have written about these two birds, and you will verify to the letter all we have said. The *tone* of your note now breathes "hope" touching the nightingale. Your patient endurance is about to be rewarded. *W. K.—J C Ewan.* One would almost imagine that you judge of character by intuition, or by studying the handwriting of your correspondents. At all events, you have found out *our* "weak point." However, as Othello says, "One more—and *this* the last;" the very last. Your black-cap is chosen; placed in a handsome castle; and looks as happy as he *can* look under such circumstances. He awaits your pleasure at Mr. Cliff rd's. You talk about "compensation." Being non-professional, our "fee" shall be the fee-simple of your thanks. *W. K.*—SONG-BIRDS: *J Read.* We advise you to procure *all* the Numbers of the Paper, referring to "song-birds," while they are in print; and by all means read our remarks week by week. You will then keep pace with us; for our subject increases in interest. *W. K.*

BOOKS: *A B.* Your question is very vague. Loudon's "Encyclopedia of Trees and Shrubs" is probably what you want.

CACTUS: *Isabella.* In all probability your buds are destroyed by the woodlouse or earwigs. No lotions or local applications will keep them off. You must search the mould in which the plants grow, and catch these marauders; traps made with Potatoes sliced, or tufts of moss, or similar contrivances, will be of much service. We take for granted that you have not cockroaches; if you have them, you must have them sought for by night, when they feed.

CINCHONA CONDAMINEA: *W M.* This plant, which is now flowering at Messrs. Veitch's Nursery, Exeter, has not yet been figured in any botanical periodical.

DOGWEED: *Tonbridgensis.* It is propagated easily by layers or cuttings. There is no better manure for Peas or Beans than well rotted farm-yard dung; but not too much of it, or they will run to leaf. In stiff clay, a dressing of plasterers' rubbish has a great effect. As to soot and salt, we never tried them. They might answer.

EGGS: *An Epicure* in salads would be glad to be informed what is the reason some eggs will never boil so as to crumble well in breaking, even with the longest boiling.

MONSTROSITY: *A Subscriber.* When branches grow thus they are called fastigiate. Here is an example of the same kind in a Heath. The cause is unknown.—*J. White.* Your specimen of Cycnoches, with one flower of *pentadactylon* and another of *Lodd-digesii*, on the same spike, is one of those puzzling exchanges of form that occur amongst Orchids, and are unknown elsewhere. Their cause is entirely unknown.

NAMES OF PLANTS: *C L.* Stanhopea Wardii, Maxillaria leucantha(?), Crinum longifolium(?). Wretched specimens.—*X, Salop.* Robinia viscosa.—*E J T.* Your specimens are in too young a state to be determined satisfactorily; 1 is probably Lastrea dilatata, which, when perfect, grows to 2 or 3 feet high; 2 is apparently Asplenium lanceolatum. *S.—M W.* We cannot undertake to name plants not in flower.||—*Anne D.* The spots on the back of the Fern are not an insect, but the fructification of the Fern (*Lastrea Filix-mas*). The cover is called the *indusium. S.—J W R.* Probably seedling fronds of Pteris aquilina; but the specimen is too young and imperfect to enable us to determine with certainty. *S.*

NAMES OF FRUITS: *C R.* Peaches: 1, 2, 3, 4, 5, 7, all Royal George, and probably 6 is the same, but it was bruised. Nectarines: 1, 4, Violette Hâtive; 2, 3, Elruge.||—*B M.* Both your Apples are correct to the names by which you received them: 1 is the new Golden Pippin; 2, Court of Wick.||

POLMAISE HEATING: *J Abell.* We have repeatedly looked for this model, but we can neither find it, nor anybody who knows of it. What is the exhibitor's name, and what the catalogue number?

RATS: *A C*, and the many other complaining sufferers from depredations by these vermin, are informed that the *only* reason for the promised RECIPE being withheld last week, was the want of space. On some particular occasions, one matter of importance must give way to another. No discourtesy was intended by the omission. It appears today. *W. K.*

RHODOLEIA: *Scotia.* This is a very handsome shrub from Hong Kong, with large crimson flowers. It is cultivated like a Camellia, but is more tender.

WEEDS: *G E.* It is Polygonum Hydropiper. You can only destroy it by continually forking it up till it disappears.

MISC.: *Amateur.* M. Victor Verdier, Rue des Trois Ormes, Boulevard de la Gare; M. Eugene Verdier, son of the above, near his father; M. Thomas, St. Denis; M. Duval, à Montmorency; M. Margottin, Rue de Marché aux Chevaux; M. Laffay, à Bellevue; M. Guerin Modeste, Rue des Couronnes, near Père la Chaise; M. Marast, Rue d'Enfer.

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS, AS THE ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

POTTER'S GUANO.—AUTUMN SEASON.—There can be no doubt, in order to obtain the most beneficial results from manures, whose effects depend on their gradual decomposition in the soil, that applying them at this season is far preferable to the spring.

Mr. POTTER begs to signify that any orders he is now favoured with shall be treated as if given in the spring, and the term of credit reckoned from thence. Price of POTTER'S Guano, 7l. per ton. POTTER'S Superphosphate of Lime, 6l. per ton, bags included and delivery to rail.

N.B. Mr. POTTER is prepared to prove that, in many instances, his Guano has afforded equal, and even superior results to the Peruvian, at 25 per cent. less cost.

MR. J. C. NESBIT, F.C.S., F.G.S., Consulting and Analytical Chemist, Laboratories, 38, Kennington-lane, London.—PRIVATE INSTRUCTIONS in Chemical Analysis, and the most approved methods of making ARTIFICIAL MANURES. Analysis of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

THE LONDON MANURE COMPANY beg to offer, as under, CORN MANURE, most valuable for spring dressing—Concentrated Urate, Superphosphate of Lime, Nitrate of Soda, Sulphate of Ammonia, Fishery and Agricultural Salts, Gypsum, Fossil Bones, Sulphuric Acid, and every other Artificial Manure; also a constant supply of English and Foreign Linseed-cake. Peruvian Guano, guaranteed the genuine importation of Messrs. A. Gibbs and Sons, 9l. 10s. per ton, or 9l. 5s. in quantities of 5 tons and upwards.

EDWARD PURSER, Secretary.

40, Bridge-street, Blackfriars, London.

MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Clover Manure, per ton ... ... ... | £11 | 0 | 0 |
| Turnip Manure, do. ... ... ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per ton, in dock. Sulphate of Ammonia, &c.

FOR WATERING GARDENS, DISTRIBUTING LIQUID MANURE, BREWERS' USE, &c.

PATENT VULCANISED INDIA-RUBBER HOSE-PIPES AND FLEXIBLE GAS TUBING.

JAMES LYNE HANCOCK (sole Licensee and) Manufacturer, Goswell Road, London.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, for portable Gas Lamps, and all purposes where a perfectly sound Waterproof and Flexible Pipe is required. Hot Liquors or Acids do not injure them; they are, therefore, much used for Chemical purposes, as they require no oil or dressing when out of use; are particularly suitable for Fire Engines, and are found exceedingly useful in Dwelling-houses for conveying Hot or Cold Water to Baths, &c.

Testimonials and prices may be had on application to the Manufactory.

N.B.—Vulcanised India Rubber Garden Hose, fitted up with Roses, Jets, and Branches complete, with union joints ready to attach to pumps or water cisterns.

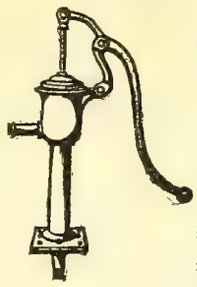
All Letters or Orders addressed to J. L. HANCOCK, Goswell Mews, Goswell Road, London, will meet with immediate attention.

Waterproof Fishing Boots and Stockings, Portable India-Rubber Boats, Shower and Sponging Baths, Air Cushions and Beds, made all sizes to order.

TO AGRICULTURISTS.—All applications for Dr. S. NEWINGTON'S Patent Hand and Horse Dibbles, Drills, Cultivators, &c., must be made, only, to Mr. GABRIEL, Surrey Chambers, Arundel-street, Strand, London.

Dr. S. NEWINGTON'S Lecture on Seeding may be had gratis.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description; but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.



S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected on the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

DURABLE OUT-DOOR PAINT.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the Nobility, Gentry, and Clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Wood, Iron, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice. Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON and SON, No. 9, Great Winchester-street, Old Broad-street, Royal Exchange, London. No Agents.—All orders are particularly requested to be sent direct.

FARM AND COTTAGE PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

| | | | |
|---|---|---|---|
| Patent Pump ... ... | £1 | 16 | 0 |
| Patent Pump, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing ... ... ... | 2 | 12 | 0 |

Larger sizes if required.

May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers.

JOHN WARNER & SONS, 8, Crescent, Jewin-street, London.

Every description of Machinery for Raising Water, Fire Engines, &c.

The usual allowance to the Trade.

MR. M'CORMICK'S PATENT AMERICAN REAPER.—Great Medal, Exhibition 1851, First Prize, North Lancashire Society, &c., 10th September, 1851.—Public Challenge to Makers and Vendors of Reaping Machines.—We, the undersigned agents for Mr. M'Cormick, having observed sundry advertisements and circulars complaining of the decision of the Jurors of the Great Exhibition of 1851, in favour of Mr. M'Cormick's Reaper, and of the reports given in the public journals of the trials which led to such decision, do hereby give notice to Messrs. Wm. Dray and Co., Messrs. Garrett and Son, Mr. O. Hussey, and all other makers and vendors of reaping machines whatsoever, that M'CORMICK'S REAPER will be tried at the Cleveland Society's Show, at Marton, Middlesbro', near Stockton-on-Tees, on the 25th inst., and publicly CHALLENGE them, or any of them, to meet us there with their machines, for the purpose of a comparative trial of the respective merits of each, to be determined by the Chairman and Council of the Cleveland Society, or such Judge or Judges as the said Society may appoint.—BURGESS and KEY, 103, Newgate-street, London.

MILDEW.

EPPS'S SULPHURATOR may be had of all Nurserymen, Seedsmen, and Ironmongers, price 21s., and upwards. The Trade supplied by Barber and Groome, Holborn, London.

This Machine has been used by the following persons, and the highest testimonials have been received as to its valuable properties, in effectually destroying the Mildew on Grapes, Peaches, Peas, and all other horticultural produce:—Dr. Plomley, F.R.S.; Mr. Ingram, gardener to her Majesty at Windsor; Mr. Smith, Superintendent at the Royal Gardens, Kew; Mr. Iveson, Sion House; Mr. Glendinning, Chiswick; Mr. Thompson, Horticultural Society's Gardens; Mr. W. P. Ayres, Blackheath; Mr. Gaines, Battersea; Mr. Cole, gardener to — Colyer, Esq., Blackheath; Mr. Robson, gardener to Earl Cornwallis, Linton Park; and many other scientific and practical men.—High-street, Maidstone, Sept. 20.

# The Agricultural Gazette.

*SATURDAY, SEPTEMBER* 20, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

THURSDAY, Sept. 25—Agricultural Imp. Soc. of Ireland.
THURSDAY, Oct. 2—Agricultural Imp. Soc. of Ireland.

MR. SULLIVAN has addressed a letter to the *Advocate* (Irish journal), which his friends consider a triumphant reply to the paper which Professor HANCOCK read at the meeting of the British Association, and which we noticed in a recent Number. He complains, in no very measured terms, of disingenuousness and hostility to Ireland on the part of Professor HANCOCK. He says that he had examined the subject from five principal points of view—1, the unsuitability of Ireland to become a great corn-growing country; 2, its adaptation to become a Beet-growing country; 3, that it is profitable to grow Beet for the manufacture of sugar; 4, that the per centage of sugar contained in Irish-grown roots was at least equal to that contained in those produced on the Continent of Europe; and 5, that the manufacture of sugar from Beet would be profitable in Ireland, even when exposed to the competition of all the tropical sugar-growing countries. He then complains that Professor HANCOCK, instead of replying to the first four of these points, has gone out of his way to show that the business of sugar making is wholly unsuited to a public company; and that he has distorted Mr. SULLIVAN'S calculations, in order to disprove his fifth proposition, that the manufacture can be carried on profitably in Ireland.

We have lately received a copy of Mr. SULLIVAN'S pamphlet, and, as we have contributed to extend the publicity of Professor HANCOCK'S statements, it is but fair that we should do the same by those of Mr. SULLIVAN. We shall therefore endeavour to lay before our readers an impartial abstract of them. Before entering on his first proposition, as above stated, the unsuitability of Ireland to become a great corn-growing country, he asserts, what few will controvert, the importance of a rotation in which root crops shall alternate with the cereals; he urges the obstacles to the consumption of root crops by stock in Ireland, arising from the smallness of the holdings, the absence of the requisite buildings, and the want of capital on the part of the farmers for the purchase of stock. He looks to the establishment of a market for Beet as a remedy for this state of things, contending that the disadvantages of removing the crop from the land will be more than counterbalanced by the farmer having a larger amount of available capital for the working of it, and consequently obtaining larger returns of produce. The unsuitableness of Ireland for the growth of the cereals is shown by reference to the average produce of Wheat in Ireland, England, Lombardy, Germany, Belgium, France, and America. It will be readily conceded that, from the moisture of the climate, Ireland is better adapted to grazing and green crops than to corn growing; though, for reasons into which we cannot enter, we are not inclined to place implicit reliance on some of the averages cited. The adaptation of Ireland to the growth of Beet is proved by a comparison of the average weight of sugar Beet in France, with the average weight of Mangold Wurzel in Ireland. The crop of Beet in France is stated as varying between 8.66 tons and 16.76 tons, the average of 12 departments being 11.32 tons. The average produce of Mangold Wurzel in Ireland is given as varying in eight counties between 15.01 as the lowest, and 22.00 tons as the highest. The average on which he bases his calculations is 15 tons of sugar Beet to the acre. It will be observed that this is higher than the French average by more than 30 per cent.; and the French average given by Mr. SULLIVAN confirms the statement of DUMAS, quoted by Sir R. KANE, of 12 tons as the crop most productive of sugar. Fifteen shillings is assumed as the price per ton of the Beet to the sugar manufacturer. From these data Mr. SULLIVAN has convinced himself that Beet will be a more profitable crop than Wheat, by the following calculations:

ONE ACRE OF BEET.

| EXPENSES. | £ | s. | d. |
|---|---|---|---|
| Two ploughings ... | 0 | 12 | 0 |
| Scarifying ... ... ... | 0 | 1 | 6 |
| Harrowing, rolling, &c. | 0 | 5 | 0 |
| Seed sowing and spreading manure ... | 0 | 10 | 6 |
| 5 bushels of bones ... | 0 | 15 | 0 |
| 3 cwt. of guano ... ... | 1 | 13 | 0 |
| Three hoeings ... ... | 0 | 8 | 0 |
| Pulling, stripping leaves, drawing, &c. ... ... | 1 | 1 | 0 |
| | £5 | 6 | 0 |

| RETURNS. | £ | s. | d. |
|---|---|---|---|
| 15 tons of Beet-root at 15s. ... ... ... | 11 | 5 | 0 |
| 4½ tons of tops at 7s. 6d. | 1 | 13 | 10 |
| | £12 | 18 | 10 |
| Expenses ... ... | 5 | 6 | 0 |
| Balance for rent, taxes, and profit ... | £7 | 12 | 10 |

ONE ACRE OF WHEAT.

| EXPENSES. | £ | s. | d. |
|---|---|---|---|
| Ploughing ... ... | 0 | 5 | 0 |
| Harrowing, rolling seed, sowing, and weeding | 0 | 17 | 0 |
| Reaping & harvesting | 0 | 12 | 6 |
| Threshing & cleaning | 0 | 10 | 0 |
| Cartage, say five miles | 0 | 2 | 6 |
| | £2 | 7 | 0 |

| RETURNS. | £ | s. | d. |
|---|---|---|---|
| 6½ barrels of 20 stones, at 22d. ... ... ... | 7 | 3 | 0 |
| 1½ tons of straw at 15s. | 0 | 18 | 9 |
| | £8 | 1 | 9 |
| Deduct expenses ... | 2 | 7 | 0 |
| | £5 | 14 | 9 |
| Profit on Beet at 15 tons to the acre, grown with guano | 7 | 12 | 10 |
| Balance in favour of Beet ... ... ... ... | £1 | 18 | 1 |

On the Beet-root calculation we would remark, that 1l. 1s. is too little for pulling, drawing, &c., if by drawing is meant delivery at the manufactory. Supposing it distant five miles; this alone, at 6d. per ton per mile, would amount to 1l. 17s. 6d. Again, if we understand Mr. SULLIVAN rightly, he means the leaves to be ploughed in as green manure, and considers them necessary, in addition to the bones and guano, to maintain the fertility of the soil. In that case they have no right to appear among the money returns of the produce. These two items require a deduction of 3l. 11s. 4d.; and if it should turn out in practice that 12 tons is the average sugar crop, instead of 15, we must make a further deduction of three times 12s. 6d. (the value per ton on the land) or 1l. 17s. 6d. an acre, making a total reduction of 5l. 8s. 10d., which will turn the balance between the Wheat and Beet culture in favour of the Wheat.

That the per centage of sugar in Irish roots is at least equal to that in roots grown on the Continent, is inferred theoretically from certain conditions of climate, which it is considered ought to produce such a result; and experimentally by some researches in Mr. SULLIVAN'S laboratory, from which it appeared—though it is admitted the subject requires more accurate and extensive investigation—that Irish sugar Beet, Wurzel, Carrots, and Swedes, actually contain more sugar than the same roots on the Continent!

For the fifth proposition, that sugar can be profitably manufactured in Ireland, Mr. SULLIVAN relies on two estimates; one, of the cost and returns of the manufacture of sugar from fresh Beet; the other, communicated by M. PAUL HAMOIR, of the manufacture of sugar from dried Beet. This is a recent improvement introduced into many Beet-sugar establishments in France, by which a great saving is effected, as the manufacture can be carried on during the whole year, instead of during only 120 days of 24 hours. These are the calculations which Professor HANCOCK is accused of distorting. Let us see what there is to justify the accusation. In the first calculation, Mr. SULLIVAN assumes 15s. per ton as the price of the Beet, and 9000l. as the expense of manufacturing 20,000 tons of Beet. The produce is assumed at 5 per cent. of white sugar, amounting to 1000 tons, valued at 28s. the cwt.; Molasses, 500 tons, at 2s. the cwt.; pulp 1000 tons, equal to 5 per cent. of the roots employed, and valued at 2l. the ton. The total expenses are 24,000l.; the total returns 31,000l., leaving a balance of 7000l. for interest on dead and floating profit. The capital sunk in buildings, machinery, &c., is assumed at 20,000l.; and the floating capital to be turned only

once a year. Interest on 44,000*l.* is therefore charged at 5 per cent., and 5 per cent. is also charged on the same sum for rent, wear and tear, &c., leaving a net profit of 2400*l.* In this calculation the proportion of pulp is assumed, as we have said, at 5 per cent. of the roots employed; and its value at 2*l.* the ton. Sir R. Kane had estimated it, on the authority of Dumas, at 2½ per cent., and its value at 6*l.* 5*s.*, which Mr. Sullivan considers too high. If Sir R. Kane is right as to the proportion of pulp, and wrong as to its value, this would reduce the net profit by 1000*l.* If from the inability of the Irish farmers to purchase stock there should be no market for the pulp, the net profit will be reduced to 400*l.*

By reference to Professor Hancock's version of this calculation, quoted in Number 33, it will be seen that it is substantially the same, except that he gives no credit for the molasses and pulp. M. Hamoir's estimate of the cost and profits of manufacturing sugar from dried Beet, as given by Mr. Sullivan, is for the manufacture of 60,000,000 kilogrammes ("61,607 tons") of Beet, at "16 francs (12*s.* 11*d.* per 1000 kilogrammes, one ton nearly)." The cost of desiccation is put down at 12,300*l.*, and of general manufacture 27,600*l.*, equal together, as Professor Hancock has stated, to nearly 13*s.* the ton of Beet, instead of 9*s.*, as in the preceding calculation. The produce is 2700 tons of refined sugar, which, duty deducted, would be worth about 39*s.* the cwt., according to Mr. Sullivan—in reality, 40*s.* (2700 tons of sugar = 108,000*l.*) Besides this, there is molasses, 1800 tons—3600*l.*, and pulp amounting to 2400*l.*, which is valued only at 9½ the 220 lbs. (100 kil.), because, being made from dried Beet, it is less valuable as cattle food. The total expenses, by this process, are 78,000*l.*, the total returns 114,000*l.*, leaving a balance of 36,000*l.* for interest, wear and tear, and profit. If, however, in this calculation we substitute, as Prof. Hancock has, Mr. Sullivan's own price of Beet, 15*s.*, and his own price of sugar, 28*s.*, leaving the molasses and pulp as they are, a very different result would come out; the total expenses will be 86,105*l.*, the total returns 81,600*l.*, leaving a loss of 4505*l.*, besides interest, wear and tear, &c. In this statement, the produce of sugar is 4½ per cent. of the Beet. Other calculations follow of what the profit would be at 5, 5½, 6, and 6½ per cent. of sugar; and Mr. Sullivan is very angry with Prof. Hancock for fastening on the lower calculation, and not knowing that in the manufactory of Serret, Hamoir, Duquesne, and Co., who supplied the comparative estimates, 7 per cent. of raw sugar, equal to 5½ per cent. of refined sugar, is now obtained. For ourselves we confess to have fallen into the same error—if error it be—as Prof. Hancock, and to have supposed that "April 18, 1850," the date attached to this 4½ per cent. calculation, referred not to the state of things "20 years ago," but to the present time. We thought that this was the actual present produce, and that the subsequent calculations at a higher per centage were hypothetical estimates by Mr. Sullivan himself, just as his estimates of the profit of growing 15 tons of Beet is followed by others, showing what it would be on 20 and 30 tons. "The simplest way," he says, in his letter to the *Advocate*, "to show how Mr. Hancock has distorted the question, in the total absence of any numerical facts of his own, is to state that 15 tons of Beet yield one ton of sugar, and on this supposition the following estimate would represent the profit:—

| Expenses. | | | |
|---|---|---|---|
| 15 tons of Beet, at 15*s.* | £11 | 5*s.* | 0*d.* |
| Cost of manufacture, say 9*l.* per ton | 9 | 0 | 0 |
| | 20 | 5 | 0 |
| Produce, 1 ton of sugar, at 28*s.* per cwt. | 28 | 0 | 0 |
| Profit | £7 | 15 | 0 |

"In this," he adds, "I have not included the pulp and molasses, and have assumed the cost of production at 9*l.* the ton, the very highest paid by any manufacturer." We find, however, by M. Hamoir's statement, 39,900*l.* set down as the cost of manufacturing 2700 tons of sugar, which is more than 14*l.* 15*s.* 6*d.* the ton. This would reduce the gross profit in the above calculation from 7*l.* 15*s.* to 2*l.*, leaving the molasses and pulp to pay interest on capital, &c., as far as they would go. On the whole, we find nothing in Mr. Sullivan's statement, as now explained, to justify the warmth of his tone, or to tempt us to embark either in the cultivation of sugar Beet or in the manufacture of sugar. The question, however, will in a few months be decided by the best of all tests, that of actual experiment. The Irish Sugar Beet Company are, we understand, about to commence manufacturing sugar, from the Beet of 200 acres, as soon as the crop for which they have contracted shall be ready. If the experiment succeeds, their operations will expand. If it fails to yield a profit, or the prospect of a profit, they will dissolve. We wish them all success, and the best hope we see for them is in the statement quoted by Mr. Sullivan, from the "Statistique de l'Agriculture de la France," that the manufacture of Beet sugar has increased in that country, from 51,201 tons in 1840, to 100,000 tons in 1850, notwithstanding the equalisation of the duties on imported sugar and sugar the growth of France, which has been in progress during the interval.

## HOUSE FEEDING AND MARKETING OF STOCK.

A few days since, four large plans were put up in the agricultural department of the Exhibition in Hyde-park, by Mr. Burness, London, connected with the house feeding and marketing of stock. The exhibitor, an experienced agriculturist, has arrived at the conclusion that, to be able to compete with foreign farmers, we must be chemically and mechanically ahead of them. For instance, we cannot compete with the foreign farmer on the natural system, such as pasturage or grazing. The extensive plains of America, and the continent of Europe, yield butcher meat at a less figure than the grazings of England. In the various departments of the Crystal Palace, the majority of our readers before this time will have perceived salted beef in abundance of a superior quality, fit for the supply of our whole shipping interest. That parties are here making wise calculations against us, there can be no mistake. Witness again Mr. Borden's "meat biscuit," of the United States, and the exertions of all the nations in the world to pick up all our chemical and mechanical improvements, for no other purpose than to be able to undersell us in our own corn and cattle markets. We are, in short, cackling for a 5*s.* protection, while we are teaching foreigners how to grow corn 10*s.* cheaper. Mr. Burness, however, proposes artificial means, beyond the reach of the foreign farmer, on the natural system, as auxiliaries for us in our present exigencies.

"Muck is the mother of meal" all the world over; and Mr. Burness proposes manufacturing the whole of the waste offal of cattle, and, indeed, the whole sewage matter of towns, into a comparatively dry and portable manure, and has invented machinery for this purpose, so as to supply us with an abundance of cheap manure, and thus enable us to compete with the foreigner in Mark-lane. On the other hand, again, he proposes an entire revolution in the mode of marketing butchers' meat, conferring upon the home farmer many advantages over the foreigner. To do justice to his scheme, we must discuss it somewhat in detail, and therefore, on the present occasion, shall confine our observations to his mode of managing and marketing fat stock.

House-feeding and box-feeding is no longer mere theory—it is successful practice, and the only practice, as Mr. Burness contends, which will enable us to appear in Smithfield successfully with the farmers of the Continent; and, in Newgate and Leadenhall, with the salted meat and "meat biscuit" of our colonies and the United States. Some two or three years ago, it appears that he laid before the Royal Agricultural Society a paper suggesting various improvements on the feeding box, so as to obviate present objections; but on making some discoveries connected with the marketing of dead meat—then and still under his investigation, the paper was withdrawn, but is now again returned. So far as patentable, he proposes patenting his improvements; for his inventions are provisionally registered, but so far as farmers are concerned, we are given to understand that no charge will be made for anything connected with the feeding box, and even for his other improvements he promises not to ask a single halfpenny until farmers have first received a shilling. His feeding boxes are so constructed that the manure may be removed by carts. This is effected simply by elevating the subdivision gates or bars, the former worked by a rope or chain with a weight on two pulleys; the cart may then be backed into the second box and so forth. Or where parties object to cattle lying on their manure, he provides for its daily removal by wheeling it out with a barrow to the dunghill.

His mode of roofing is different in the framework from that of the Crystal Palace, but so constructed that any number of cattle may be contained under one roof or rather system of roofs. On his plan for a farmer he exhibits a system for 200 cattle, and for a cattle market from 6000 to 7000 oxen, and 30,000 to 40,000 sheep. His principle of roofing is that of a double roof. Interior of the principal roof he constructs a temporary one, so to speak, sufficient to create currents of fresh air during summer, and thus keep the building cool.

He next arrives at the conclusion that what is good for the farmer's ox or sheep, is also good for the butcher's. In other words, that fat stock should be treated by our large commercial and manufacturing towns with the same deference to agricultural science, as they are treated by farmers themselves. If farmers follow the natural system, so may our urban friends—but if farmers adopt the artificial, as we now obviously must, then ought they also to reciprocate with us. The arguments to the contrary lately given before a select committee of the House of Lords—that to drive the fat ox so many miles to the lair of the salesman is advantageous for the health of the ox, after being over fatigued already in standing some 10 or 12 hours on foot in a railway van! go for nothing in the estimation of the exhibitor. He neither concurs with the proposition, that a fat ox is a locomotive engine, nor that the salesman is justified in charging for the natural system of lairage what ought to furnish the artificial. The sum which we now pay for lairage and for driving cattle from the railways to the lairs, and from the lairs to market, Mr. Burness contends, will do more than provide feeding boxes of the kind which he proposes in which cattle may be sold—a conclusion obvious at first sight; for if it is profitable, and will repay the farmer to erect household accommodation, why should it be otherwise in towns or the suburbs of towns? When the ox arrives in the metropolis, for instance, it cannot be in all the corners of it at one time. After it is slaughtered it is subject to subdivision, but previously it can only occupy one space or area of land; consequently, if four acres are provided for it, three of them must always be empty. Now such being a fact—a fact which cannot be controverted, the propriety of travelling it from railway to lair, from lair to market, and from market to the slaughter-house, if not a different lair contiguous, may be questioned; for every removal costs the farmer and the public something more than a reduction in the quantity of butcher-meat. Such may be a convenient system for bankers, butchers, and salesmen, but it neither suits depresssed agriculture nor a heavily taxed public. The area of land required for the lairage of an ox in the metropolis is valuable, and more so at the centre than the circumference. Now as all landlords have a right to charge rent for their areas, and do charge rent for their areas, it obviously follows that one area would be cheaper than four, and that that area would be cheaper at the circumference, so that the difference should be paid by butchers and salesmen. The different areas now under lairage, market, and slaughter-houses exceed that which would be required on Mr. Burness's plan by 400 to 500 acres; hence the result in the item of rent alone when the fee simple of land can scarcely be set down at less, even in the suburbs, than 500*l.* per acre. The city architect, in his evidence before the select committee of the Lords, took credit for part of the present area of Smithfield (some 2 or 3 acres) at 65,000*l.*!! According to Mr. Burness's plan, when the fat ox or sheep arrives at the metropolis or any other large town (supposing a railway leads into the market ground), it is quietly driven into a well-littered box, where it is treated as it had been treated when at home. In this position it can remain ruminating at ease until a few minutes prior to the commencement of the market, when it may be tied up to a ring in its box, and the subdivision gates elevated; and when sold, untied and allowed to lie down at pleasure, the gates having been first lowered. In such a box it can be fed by the butcher until taken to the slaughter-house, which, according to the general practice, would, we believe, be at an early hour in the morning, so that in those cases where private slaughter-houses were used, little inconvenience would be experienced from travelling the streets. His practice is just that of selling the fat ox in his stall—a practice the benefits of which have from time immemorial been appreciated by farmers. Were a farmer to take out his ox from the stall, and to drive it some two or three miles over a flinty road to tie it to stake to sell to a butcher, would he not be set down as a notable fool? and yet does not this practice involve the very principle of the system of separate lairs now in force in all our manufacturing towns, and proposed to be perpetuated in the individual case of Smithfield? Little as such parties may be versed in agricultural science, surely, says Mr. Burness, 1851 demands something more of the British capital, which has invited all the nations of the world to bear witness to its chemical and mechanical ingenuity than this. *X.*

## ON THE CULTURE OF THE VETCH.

The Vetch is one of the most valuable cultivated plants of the farm, and has been long cultivated in Britain. The herbage is peculiarly grateful to horses,* and also to sheep and to swine; cattle also eat it with avidity. The plant delights to grow on strong deep loams, tenacious, and, at the same time, dry and mellow. The soil must be of good quality, and clear of weeds, in good heart, and of firm texture. The land is winter-ploughed, with one furrow, after a crop of Wheat, Barley, or Oats, and sown with four bushels of seed in the end of February, or so soon in March as the weather will permit. A small proportion of the seed of Barley or Oats is very usefully mixed with the Vetches, as the earthy culms tend to convert the watery constitution of the Vetch as food for animals. The land is harrowed, as for Oats, and rolled heavily soon after the seed is sown. After the interval of three to four weeks, another portion of a field is sown with the same seed, and in the same way harrowed and rolled, as above directed; and, after the lapse of three to four weeks more, a third sowing is done, which will finish the seeding of the field, and end the sowing of spring Vetches, about the 25th of April, or even later, and into the month of May, which provides a regular succession of cuttings of the Vetches, for the purpose of summer soiling of animals in the yards.

The first cutting of spring sown Vetches comes into use in June, and succeeds the red Clovers, which are then cut for hay. The work-horses of the farm are fed in the cattle-yards with a quantity of the Vetches that were cut in the forenoon of the previous day, in order that the herbage may be in a somewhat withered state. This work, performed by a spare servant with an old horse or brood mare, will give ample employment on the farms of requisite extent, and which are only put into a systematic rotation of use. The proper

* It is as much *physic* as *food*; so we have heard it described; and so we have found it to our cost in several instances. It should be given with caution to horses when it is young. *Ed.*

quantity of the herbage is placed in the feeding racks in the yards in the afternoon of each day, and the horses are lodged in the yards during the nights, from 6 o'clock in the evening to the same hour in the morning, when they eat a feed of Oats in the stable, and go to work. During the dry periods of summer the milch cows are very advantageously treated with the evening's provender in cut Vetches, and given them in a feeding yard, which adjoins the cow-shed, and in which the greater part of the cows are lodged more comfortably than in the shed, where the closeness of a roofed house produces an over heated atmosphere, from the respiration of the animals surcharged with the gaseous fluids of the succulent Vetch. The open air is the best lodging, accommodated with a shelter shed. This feeding of the cows very much increases the quantity of milk. The store swine and even the brood cows that are not suckling are very economically fed with Vetches, of which they eat the green and leafy part, and tread into dung the under stems that are bare of foliage. Pigs are very fond of Vetches, and thrive well upon the vegetable.

The use of green Vetches for feeding horses, cows, and swine, as above described, will extend throughout the summer to the month of October. During that time a very large quantity of excellent manure will be produced if the very essential provision be made of an ample store of straw for the summer's use, and built into a stack for the special purpose from the spring threshings of the grain.

Animals fed with Vetches render much urine, which impregnates the earthy culms of the straw, and is the best use of liquids that is yet known. The quantity of litter must be sufficient to absorb all the urine, and if this condition be complied with, the yards will be employed in the manufactory of dung in the summer equally as in winter, and the process will never cease throughout the year. This is a grand point of attainment to have a constant fabrication of the vital principle of any agricultural undertaking. The animals will refuse the under stems of the Vetch plant, as they become woody, and bare of leaves, and this residue must be spread evenly over the surface of the yards, in order to get mixed with the straws, and be decomposed together. The level accumulation being evenly wetted with the urine of the animals, will become a mass of much value.

A crop of Vetches must completely cover the surface of the ground, by means of the umbrageous foliage which is intertwined and linked together by the tendrils, or spirally twisted threads on the upper ends of the common footstalk of the leaves. In this way the Vetch resembles the crop of Peas, as both plants belong to one family, and smother and kill every weed, retain moisture, and encourage an incipient decomposition of particles on the surface of the ground, by the exclusion of air and light. Consequently, when Vetches are grown on clayey loams, the land is sown with Wheat, on a single furrow of ploughing, after being scuffled clean of any surface weeds, and in some cases treated with a light dose of farm-yard dung. This last application refers to lands of prime quality, which is in tilth and cleanness to be sown with Grass seeds. In most cases, the Vetch forms a catch crop, and the land is fallowed before being seeded with Clovers. When Vetches are grown on inferior land, the following crop is generally Oats in the spring.

The latest crop of Vetches has been made into hay, which has proved to be the most healthy provender that can be eaten by horses. There are seeds formed in some quantity at that season, and adhere to the haulm; and though, singly, they have proved a very heating food, yet in mixture with the straw they may be the cause of the value of the hay of Vetches.

Winter Vetches constitute a permanent variety of the plant, and has no doubt been got by occasional leavings of the spring-sown Vetches having been observed to live through the winter, and being used in propagation from the seed that was so produced. The winter Vetch is sown on one ploughing of the land after a crop of Wheat, and in two or three successive sowings during the months of September and October, and covered by the usual harrowings. A mixture of Wheat, Barley, and Oats is recommended, and also Rye and winter Beans, in a small ratio, with the Vetch seed; and Rape is much used for that purpose, and very favourably where the crop is intended to be consumed by sheep.

The crop of winter Vetches comes into an early use in the spring, and is cut for soiling the animals of the farm in the yards, and is also eaten on the ground by sheep. In the latter way, the animals are confined in a fold of hurdles that is pitched in a close regularity over the ground, and closely adjoining to the growing Vetches, which are cut by scythe, and placed in racks in the fold. This method is undoubtedly preferable to the old custom of folding the animals upon the Vetches, and thus mixing together the food, urine, and excrements.

The ground from which the Vetches are cut for soiling is manured by folding the sheep regularly over the surface, to which the vegetables are carried from the other parts of the crop, and placed in racks in the fold. In this way a field of land is equally benefited; and when the crop is wholly used, the land is once ploughed in the late June, or early July, severely harrowed, and lightly scuffled, and sown with Turnips, in rows on the flat. It is a good opportunity of using guano, or some finely-pulverised auxiliary manure; and a fair crop of Turnips being obtained, a second manuring will be given to the land, by the Turnips being consumed on the ground, and will thus confer a lasting fertility by two successive feeding crops. On lands that fall below the medium degree of fertility, this mode of using the ground will prove very beneficial, and cannot fail to materially assist the general amelioration of the farm. In cases of superior lands, the crop is used as above described; and after it is consumed, the land is sown with Wheat, on one ploughing, in the month of October. The crop of Vetches defers the fallowing process, but by no means abolishes that indispensable renovator of fertility on all soils that cannot be cultivated by drilled plants.

Vetches, in the two varieties of the winter and summer distinctions, constitute a very valuable link in the chain of green food, which has become an easy attainment, from the plants that are now known in the agricultural world. Rye comes first in the spring as food for sheep, and chiefly for ewes and lambs. Winter Vetches succeed closely, and introduce soiling in the yards, along with feeding in the fields. Red Clover follows, and is succeeded by the spring Vetches, which, in the different sowings, reach the month of October. White Turnips are then ready—green globes succeed; Swedes, yellows, and hybrids are next introduced, which, with the assistance of stored Cabbages and Beet-root, reach the season of the winter Vetches of the next spring. Potatoes render much assistance in feeding swine and the young cattle in the yards, and in being steamed for the work horses. By this arrangement every part of the year is supplied with juicy esculent food, without which animal life must ever be very imperfectly developed. And any farmer who neglects the ample provision of such provender knows not half his business, and is only qualified to degrade the profession, and ruin himself.

When success attends a crop of Vetches, no plant better repays the labour of the farmer—it yields a large quantity of very palatable food, and an immense residue for the dung heap, which is formed both of easily decomposable matter and of a more lasting earthy structure. In this respect the haulm of the Vetch exceeds almost any other plant, both in the quantity and quality of the decomposing residue. Like the Pea, it must be thickly sown, not under four bushels an acre on land of any degree of quality. The writer of this article has had a long and large acquaintance with Vetches on lands of various descriptions, from the very light sandy loams of the new red sandstone, and the iron sands that lie below the gault of Surrey, to the most obdurate and intractable of all cultivated lands in Britain—in the clays of the plastic formation, and the London deposit; and he can very safely state that the above quantity of four bushels is not at all an overseeding of an acre of Vetches. The spring sowing requires more seed than the autumn season, when three bushels will be sufficient. A thin crop of Peas or Vetches is the most pernicious to the land of any growth that is known—the vacant spaces are quickly filled with weeds, which are propagated unchecked both by the root and the seeds. Vetches being cut for use, do not allow the maturation of the seeds so much as the ripened crop of Peas, but of either plant a thin crop should be ploughed without delay, and the land fallowed. Very much of the prejudice entertained against these plants arises from this point of mismanagement.

A use of Vetches has been proposed in allowing the whole crop of the spring sown plants to remain on the ground and die, and rot upon it, and answer the purpose of a manuring. In this way, a good crop of Oats might be obtained by one ploughing of the land, but a year's value of the land will be lost, and the farming will be foul, by reason of the weeds being imperfectly extirpated, and the Vetches would leave many remnants of life to encumber the crop of Oats. Consequently, the intervention of this rotting crop would only lengthen the rotation, and defer the fallowing of the land; and it might form too large a subtraction from the value of the crops of the rotation to have two years idle in the bare fallowing, and the Vetches growing on the land. If the crop of Vetches can be obtained, the rotting of the vegetables on or in the ground might tend to add loam to the soil, which is just what is wanted by clay lands. *J. D.*

## CROPS IN THE COUNTY OF WEXFORD.

Wheats are, I believe, far below an average crop, being in all places, with very few exceptions, blighted in various ways. First, by the rotting of the roots, which caused a simple cessation of further growth in the plants, before the grain became much more than merely "set." Secondly, by the attacks of the Wheat-fly, whose ravages by the larvæ are very extensive in most places. And thirdly, by an unknown cause of blight, which affects one side, and one side only, of most heads, all through each field. Thus far, as regards autumn or winter-sown Wheats. Spring-sown Wheats appear, up to the present, to have escaped the above disasters; perhaps, because of their less advanced state towards maturity, at the periods of occurrence in those more advanced. And it depends now on the favourableness of the month of September, and the latter part of this month, to determine how far spring-sown Wheats may be more successful, as they were in many places last year, than the more early sown crops. Should this anticipation be realised, it will go still further to remove the old objection to Turnip culture,—"the land could not be cleared of the crop in time to sow the autumn or winter Wheats."

Barley is in this locality, and, I believe, throughout this great Barley-growing county, a good crop, much better than of last year.

Oats.—All the white varieties sown in spring severely blighted, nor have the same kinds, though sown in autumn, fully escaped. Such blights are more common in this county than I have ever known in any other county of Ireland; and hence the extensive culture of the Tawney Oats, so called locally because of its colour; but better known elsewhere as the Don, or Dun Winter Oats, which stands the severest winters, and ripens early. The grain is good, though the produce is light, and the straw of little value, except for dung, threshed by a machine, or thatch, when threshed in the ordinary way.

Black Oats.—The Tartarian, more especially, seem to do much better in this county, being less liable to blight than the white kinds.

Beans, on all soils suited to their culture, never did better than they did this year; but within the last ten days they appear to have suffered much from blight in the leaves, and, of course, a cessation of growth in most places. The early sown, or forward crops, will be good; but the late sown, I fear, will be light in quantity, and poor in quality. This should be a lesson to Irish Bean growers to sow early—before Christmas, if possible.

Peas, now becoming again a favourite crop on the poor shingly light soils of this county, never appeared to do better than they did this year, up to the present time; but whether the farmer's hopes will be realised as regards quality in this crop, is yet to be determined; but speaking from long experience in the growth of Peas, it is much to be feared that the showery weather now set in will much favour the ravages of a maggot long known to be highly injurious to the Pea crops in wet harvests.

Flax, now becoming again a favourite crop with the people of this county, wherever fairly cultivated, did very well this year; so much so, that many farmers, hitherto listless in its regard, are already making up their minds on a more extensive cultivation of it next year; whilst those who have establishments for steeping on Schenck's system, with improved dressing appendages, are enlarging their establishments, and new establishments springing up in localities where until lately such had not been thought of; and as home grown seed has been known to produce as good crops, if not better than those produced from imported seed, and as the value of the seed is now becoming so well known in the economy of stock feeding, very many who never before grew Flax, are now seeking to save their own seed both for feeding and future growth.

Turnips.—The ravages of the new pest, the moth, so much complained of in most places, have proved fatal to many of the best Swede crops in this county. The very early and strong Swedes appear to have escaped best, at least, so with me; whilst the late sown rough-leaved varieties are likely to do well, now that the ravages of the pest appear to have ceased.

Cabbages, of all kinds, suffered more or less by the moth in question, especially those young and lately transplanted, whilst the little animal was in full vigour.

Mangold Wurzel, so long so highly prized in this county, has had a narrow escape this season, owing to the attacks of a fly, in character much resembling the "blue bottle," which produces "the jumpers" in bacon, or the fly which produces the "maggots" in sheep. This fly deposited its eggs between the two skins—the upper and under—of the leaf, in large quantities; and as these pests increased in size, and fed through the leaf, actually destroyed its functions; hence it is we now see so many fine crops disfigured by withered leaves, and the crops less luxuriant than under other circumstances they would be.

Sugar Beet, now becoming a favourite crop, not only for cattle feeding, but with the view of obtaining supplies to warrant the establishment of sugar manufactories, suffered in the same degree with the ordinary Mangold Wurzel; but in spite of the ravages of the insect in many places still at work, good hopes are entertained of heavy crops of all the sorts.

Carrots, in some parts, thin in number; the Altringham more especially (with me at least) promising very well. The White Belgian and Long Red Surrey doing much better.

Parsnips, the Hollow-crowned more especially, on all suitable soils well prepared, a successful crop.

Meadows generally good, and hay generally well secured.

Pastures, quality of land considered, very fair, though the produce in butter is light in most dairies, whilst the sale of store and fat Cattle is far from remunerative. The case is quite different with sheep, for both lambs, hoggets, fat sheep, and wool, have in price rewarded the flock-keeper's laborious industry.

Pigs healthy; and though the prices have been low, the sales have been remunerative, owing to the low prices of foreign food and the improved systems adopted in pig feeding on the produce of the farm, despite the repeated Potato failures.

Poultry on the increase, and much improved in character of breeds and quality of marketable specimens.

Whenever varied cropping with such modern improvements have been adopted, and mutual confidence existing between landlords and tenants in this county, the farmer's prospects are by no means so discouraging as in others, where the system of wild extirmination cuts a more prominent figure. But even in this our "model county," we have our "dark spots," and sullen looks of despair, in uttering the fatal words now so common amongst the once happy Wexford farmer, whose destination is "the poor-house or America." *E. Carroll, Beg Erin, Castlebridge.*

## THE CULTURE OF THE PEA.

Peas are sown during the months of February and March on the stubbles of Wheat, Barley, and

Oats, or on Grass layers, as the rotation of cropping may direct. In the broadcast way the seed is scattered on the surface of the winter furrow of the land, and covered by two or three double tines of the harrows, as the tilth of the soil may require. When sown in drills, the land is severely harrowed, drills are opened by one horse and ploughs at the distance of 10 to 14 inches; the seed is sown broadcast, and falls into the furrows, when a tine of the light harrows finishes the process. Or the seed is sown on the pulverised surface by the corn-drill machine, with coulters which make ruts in the ground, that receive and cover the seeds. It is essential that Peas be deposited in a bed of dry powdery soil, and in dry seasons the land may be rolled with advantage.

In the broadcast way the only possible cultivation is, pulling by the hand the tall weeds that arise during the early growth of the crop; and in the advanced stage, a scythe can cut them above the height of the Peas, to prevent the ripening of the seeds. This necessity may not often occur. In the drilled cultivation, both the horse and hand-hoe have been, and are used, to cut the weeds, and pulverise the soil of the intervals, and is continued till the growth of the plants advances over the intervals, and prohibits the operations. On good lands, this hindrance very soon takes place.

An acre of land sown with Peas in broadcast requires three bushels of seed, and two bushels will be sufficient, when the land is drilled in the way that has been mentioned. Peas must be thickly sown, in order that the herbage may cover the ground completely by the interlacing of the leaves and tendrils, and thus exclude droughts and violent heats, and prevent desiccation. A crop of Peas in a thin straggled condition, forms one of the most pernicious vegetable coverings that can grow upon the earth; the vacant spaces are quickly covered with weeds, and no means remain of removing them. The seeding is perfected, and the propagation is largely multiplied. When such a contingency happens, the crop should be ploughed under, the land used for Turnips, or prepared for winter Vetches. On the other hand, a crop of Peas of middling luxuriance, which completely covers the ground, retains moisture, kills the weeds, and encourages putrefaction. The surface of the land is mellowed and fertilised by the agency of moisture and darkness, which prevail during the umbrageous existence of the crop, and the annual weeds are better demolished than by any drilling and hoeing. The roots are fibrous, and do not, like the Bean, descend into the ground in a tap-form, and divide it; but a great benefit is conferred on the land by the shade of the leaves in a close covering. When the purpose is completely effected, the land is found in a good state for being sown with Wheat, with one ploughing, on the stronger soils of clayey loams. Where gravels and lighter lands prevail, crops of Barley or Oats are very profitably used; and in many cases, a clean state of the land is procured for being sown with Grass seeds.

Little or no advantage is obtained by drilling the crop of Peas (?) the intervals can only admit the hand-hoe; the stems are procumbent, quickly fall down, and cover the intervals, by which the hoeing is prevented at too early a period of the season for effecting a pulverisation of the soil or destroying the weeds. The Bean stands upright during the whole season, and it and every plant that is advantageous for the green-crop culture must admit the implements throughout the summer, and the pulling of tall weeds by the hand up to the time of maturity. The natural growth of the Pea plant prohibits these applications, and, consequently, is ineligible in that way.

Peas are a valuable but a very precarious crop, being produced by chance and accident more than by any attention or provident foresight. In the earlier season moisture is required in abundance, to forward the herbage in a due quantity to produce and carry the proper crop of pods, but not to push forward an over duly luxuriant growth of leaves and stems; and in the end of summer heat and sunshine are required to ripen the crop gradually and healthily, but not of an intensity to contract the pods and shrivel the seeds. These two chances seldom occur in one year of the degree and quality to suit the nature of Peas, and hence the crop is rendered more precarious than any other growth of the farm.

The maturity of Peas is shown by the brown colour of the pods and the hardness of the seeds on the under-part of the stems. A general ripeness of the upper pods would incur much loss by the opening, bursting, and shedding of the seeds from the pods that are over-ripened. The crop is reaped by hand-sickle, which partly cuts and partly pulls the stems from the ground; the crop is rolled into small heaps that are tied with a straw rope round the girth, or a twist of the Pea-haulm. The heaps are frequently turned over and exposed, and when sufficiently dried the bulk is carried home and built into ricks or lodged in barns. The threshing of the grain is easily performed, as the attachment is slight between the straw and the pods, and these latter freely part with the seeds, which are as easily winnowed from the chaff. The manufacture is very easy.

The average produce of Peas on an acre may be stated at 24 to 30 bushels. The grain contains much farinaceous and saccharine matter, and is highly nutritious. No other Leguminous plant surpasses Peas in this quality, except the "French Bean." But a certain toughness, which makes them adhere to the teeth, renders the seed of this latter plant disagreeable to be eaten. The meal of Peas has been baked into bread; used unmixed the digestion is difficult, therefore it is better mixed with Oat and Barley meal. Mixed with the skim milk of the dairy there is no better nourishment for young pigs, and for farrowing sows. Such a mixture very much provokes the milking propensity. When pigs are weaned it forms a most proper food for them. It is also given to bacon hogs; and notwithstanding the supposed loss when the grain is used in an unbroken state, the belief yet obtains, that in the last month of fattening the Peas are very useful in that form, for the purpose of imparting a firm consistence to the bacon. It has been proposed to malt the seeds for that purpose, and kiln-dry them slightly, in order to diminish the flatulent property.

The straw or haulm of Peas, when well got, is an excellent fodder for horses and cattle, and especially for sheep, which animals are very fond of the dry pods when the seeds are gone by threshing. *J. D.*

## Home Correspondence.

*Poultry.*—A hen of mine hatched three chickens, and as there were more to be hatched, these three were taken away and put in a basket near a fire. A few hours after they had been put in the basket, the poultry woman returned to look after them. But lo, they were gone. Something must have run off with them, as they were too feeble to run off themselves. Search was made in every direction, when at last they were found at the bottom of a cupboard, under the guardian care of a favourite white cat, who had carried them off in her mouth by the neck (their necks being wet), as a cat does her kittens, and there she was lying on her side with the chickens cuddled up between her legs, in the posture of a cat when suckling her kittens. When they were taken away from her, she evinced the uneasiness and anxiety which a cat usually does when deprived of her young. I must mention that some time ago she had a litter of kittens in this cupboard. She has always lived in the midst of the poultry, and has never been known to devour any, so that I feel sure she took them in order to adopt them as her own offspring. *D. B. B.*

*Vegetarians.*—Certain persons call themselves vegetarians, a term implying abstinence from every description of animal food, but how do they act up to their profession? They consume milk, cream, butter, cheese, lard, dripping, and suet, the very essence of cows, oxen, pigs, and poultry. Surely the name does not admit of such luxurious livers, but more properly belongs to individuals who exist upon bread, oatmeal, Rice, Potatoes, Pulse, &c. There can be no objection to human beings eating what they please, and what agrees with them best, but let things be called by their right names. What difference is there between one man being designated a water drinker, who uses beer and not wine and spirits; and another being considered a vegetarian, who refuses beef, mutton, and pork, yet devours butter, cheese, eggs, suet, cream, &c. It puts one rather in mind of a man fasting upon an excellent dish of fish and Potatoes—a positive treat. *Falcon.*

*Temperance.*—The question between "Falcon" and the "Labourer" seems to require the interference of a fraternising party; the subject to many may seem but a pecuniary one, but yet, if viewed in its proper light, it affects, to an unlimited extent, the moral and social condition of the most important class of the community. Beer for labourers may be deemed necessary, but I fear only by those who, inured to it by habit, would fain always enjoy it. For my part, I should like to have the opinion of a medical authority before I would so emphatically pronounce upon its necessity. Farmers and proprietors in general may aid in putting down drunkenness, by ceasing to give their workmen intoxicating drinks in any quantity, or on any occasion; there are many substitutes much more congenial to the constitutions and natural economy of man; by so doing, they will cease to propagate the seeds of vice, generating to an extravagance almost unimaginable. You who despise this doctrine, as being too hard, go visit the dwellings of some (if not many) of your farm-labourers occasionally, and there behold the miserable poverty of a family, the main supporter of whom is away at a public-house spending his earnings, which belongs to his family by every law of right; go further and visit the dwellings of many mechanics, and there see a wife and children in such a state of wretchedness and poverty as is easier imagined than described. Look around through your country, and view with disgust (as undoubtedly you will) those extensive mansions (the poor-houses) which intoxicating drink and its direful effects has filled with wretched, impoverished, and emaciated inmates. I think I can say, without exaggeration, that from 60 to 70 per cent. of the inmates of poor-houses, in some districts, owe their present condition to the vice of intemperance. These are a few of the many evils emanating from this vice, which the use of malt drink is liable to lead to, commencing with a small portion, and generating to a habit. *E. F., Phœnix Park, Dublin, August 5.*

*Removal of Hedge-row Trees.*—In reference to the desire of "An Enquirer" to receive advice on this subject (see No. 35), I should say if his land is situated in any position not too exposed, and a considerable part is in tillage or will advantageously admit thereof, it would be best to remove all timber and useless fences, with the exception of an occasional tree of the most thriving, ornamental, and innoxious kind, to be left out of the way, and where useful in affording shade and shelter to stock. This would lay the land open for farther improvement, increase its available quantity, and afford a chance of growing good crops at a moderate expense. It would admit air and light, without a due share of which neither crops nor cattle can prosper. On the other hand, if the land is high, or in any way exposed, protection is very important, and may be given by hedges and trees, not growing at random or in too great abundance, but arranged so as best to afford the required shelter, to suit the operations of culture, and all the other circumstances of the case. Belts of plantation judiciously laid out would perhaps be better than hedgerow trees, but so long as these are wanting it would be wrong to dispense entirely with existing shelter. As regards clearing good and bad land, if the circumstances are such as to induce culture at all, I would make it the chief object, and everything else subservient to it. The same with grazing. In both cases let trees and hedges be grown only where useful to divide the fields and afford protection. A superabundance in either case is an evil, but least so on Grass land, where, although not more useful, they are less injurious, and on high exposed land, however managed, a greater number would be required than for low land in the plain. The quality, position, &c., of the land ought to determine the mode of management; and this again should regulate, to some extent, the fencing and shelter required. There is generally too little shelter from the height of 500 or 600 feet upward, and in Scotland this remark will apply to places less elevated. Farms may be seen there on the stormy sides of hills with scarcely a tree or fence higher than a few feet. It is a great want, and entails great loss. Cattle have no shade to retire under during the heat of the day in summer, when they do not graze, and consequently they run or move restlessly about, to the injury of the ground and themselves. The wind, too, at times, sweeps along with much fury, injuring every growing crop in its progress, especially Potatoes and Beans. All this might be prevented by shelter. Even a good high hedge in the proper place, crossing the direction of the storm, is of great service. Additional protection should therefore be encouraged both in the higher and lower parts of Scotland, whilst in England, such places as the Wolds of Lincolnshire and Yorkshire would be much beautified by judicious planting. A small part of the surface would be occupied thereby, but this would be far more than counterbalanced by the general improvement. Necessary protection, however, has nothing to do with the incumbrance of fine land in sheltered valleys or plains. The value of such land as yet is scarcely known, but as intelligence progresses it will be devoted to purposes vastly more important than growing trees. If it were cleared, drained, and all well cultivated, what an immense advantage would follow to the nation, and especially to those most concerned. But are tenants always prepared to take advantage of the removal of impediments? The latter are more a symptom than a cause of bad farming, and their removal will effect but little, unless followed up by a system of management well suited to the place, and directed with energy and skill. It is but fair to suppose that great improvement would in general take place, and improvements of this kind are seldom lost; they rather tend to accelerate the advent of still better things, when, instead of scanty crops or entire failures, the greater part of the land will produce abundant crops of any kind, with almost absolute certainty. That time will assuredly arrive sooner or later, and "An Enquirer" would no doubt consult the interests of his family better by assisting to bring it about, than by continuing to encumber good ground with timber which, according to his own statement, will scarcely repay the expense of preparation for market when grown. *James Donald.*

"*Necessity is the Mother of Invention.*"—Mutability is stamped upon all sublunary objects: change and progress peculiarly mark the present era, and agriculture can no longer be permitted to remain dormant; the farmer must adapt his measures to the requirements of the times in which he lives. The want of hands, the costliness of manual labour, and the uncertainty of the weather, have caused the Englishman to invent a mechanical hay-maker, and the American to construct a corn-reaping machine. The abandonment of protection has already compelled the owners and occupiers of land, and induced their servants, the implement makers, to contrive and adopt many improvements which otherwise would most probably have been neglected, and given such an impetus to agriculture as its sluggish progress required. And it is probable that its late unprecedented progress will go forward with accelerated speed, as each invention naturally prepares for still further improvement. Those farmers who still cling to old prejudices and old practices, and will not advance with the times, will be compelled either to emigrate, or give up farming, and their farms will be occupied by a more enlightened and energetic set of farmers, and the country will be benefited by the change. But it will be a sad result, if the abolition of the Corn-laws should deprive England of its most energetic and enterprising labourers and farmers. This is an evil already commenced, and greatly to be deprecated, for, as the poet says,—

> "Princes and lords may flourish or may fade;
> A breath can make them, as a breath has made:
> But a bold peasantry, their country's pride
> When once destroy'd, can never be supplied."

Such energetic enterprising men constitute the wealth and strength of our country; they can ill be spared, and their loss will be severely felt before it will be properly estimated. If emigration were confined to the helpless and the indigent it might be beneficial to the country; but it seems strange policy to promote it amongst the industrious classes,

those who seek the hidden treasures of the earth, and convert them into substances more valuable than glittering gold or sparkling diamonds. If rents were reduced, and judicious measures adopted without delay, this evil, which must otherwise increase, would be greatly checked. Low as is the price of produce, there is still much land which might be profitably improved by occasional cultivation; and there is much of the land now in cultivation, upon which additional labour might be profitably employed, in its regular cultivation, besides all the extra labour required in more perfect drainage, in subsoiling, irrigation, stubbing up trees and fences and planting fresh ones, making roads, and erecting buildings, &c.; and the Land Drainage and Improvement Company affords great inducements to perform these acts. Besides these known improvements, which are still but comparatively rare, the necessity of present circumstances must compel the farmer to do his part, in discovering other new improvements. The mechanic and the chemist have done, and are doing, much to assist him in this way; but he has done very little for himself. Let him then consider how he can increase the quantity and improve the quality of his produce, and how he can quicken the growth of his crops. Cannot the land be kept more constantly going, never being idle, but producing one crop in wide intervals, while another is coming on in the space between the rows, so as to grow two or three good crops on the same land every year, instead of only two poor ones in three years, according to the old system, which is still practised in some places. Some will say that low prices will not pay for high cultivation. But they certainly will not pay for poor cultivation; land must now be cultivated in the very best way, or else laid down for pasture; good cultivation or none at all, must be the order of the day. *O. F.*

*Land Draining Companies.*—For the sake of brevity I pass over those observations in your correspondent Mr. Shelley's letter, published in the *Gazette*, 30th August, which convey no information. He says afterwards "that his Company's tables will show that the annuity for 50 years on their loan would be 5*l.* 17*s.* 9*d.*, and that the Company's commission adds 7*s.* per annum to this amount, making a little over 5¾ per cent. for 50 years." There may be an error in printing, but to my understanding these sums would make 6*l.* 4*s.* 9*d.* per cent. In another part he says, "the Company's charges, which include every one of the matters above alluded to, are embraced in a commission of 11*s.* 6*d.* per acre in the case of drainage." If the words alluded to point to the sentence preceding them, for the "matters," there we read: "In short that he (the proprietor) is, fortunately for him, his own surveyor, his own engineer, his own lawyer, his own agent, and pre-eminent in each capacity: that his time or his bailiff's cost nothing, that he loses no interest of his money employed during the progress of the works, and that he spends nothing in expenses, travelling or otherwise, during the time." If these are the "matters" included in the 11*s.* 6*d.* per acre, charged by Mr. Shelley's Company, we have only to add the cost of materials, and on draining the 100 acres, the account would be—

| | |
|---|---|
| 500 acres, at 11*s.* 6*d.* per acre ... ... ... ... | £287 10 0 |
| 2500 tiles per acre, at, suppose, 20*s.* per thousand, for 100 acres ... ... ... ... ... ... | 1250 0 0 |
| | £1537 10 0 |

If this be all, I acknowledge it a better contract for the borrower than he can negociate with the commissioners, because 6*l.* 4*s.* 9*d.*, at most 6¼ per cent., is better than 6*l.* 10*s.* or 6½ per cent., to be paid them, and the term for repayment longer; but I fear there will be a labour account to be added. A few words, craving your patience, as to a proprietor executing the work. We are told in that excellent article on Draining, in No. 171 of the "Quarterly Review" (Dec. 1850, I think), and from which Mr. Murray has published a most useful extract of part of the Essay, price only 4*d.*, that the writer, after perusing Mr. Parkes' works on the subject, asked his assistance, having failed in his own attempts. He says "Mr. Parkes brought a foreman, with whom he set out drains and left the work under his superintendence. To this man we paid 20*s.* per week. He understood pretty accurately the prices of work, and dealt fairly between the employer and the labourers. He instructed them in the use of the new tools, he measured up the work, kept the accounts, paid the men, and laid every pipe and collar with his own hands. For these services we pay Mr. Parkes 5*s.* per acre drained, and some travelling expenses." So that one does not see why proprietors having obtained the means, should necessarily fail in the attempt to drain land; for no doubt experienced men may be obtained to superintend and lay the pipes—a most essential part I grant—and the land often lies so well for drainage that no mistake can be made in that respect. In my first inquiry, which you favoured me with insertion in the *Agricultural Gazette*, I simply wished to ascertain the actual expense of drainage by borrowing capital, and having now obtained some insight thereto the purpose is gained, and with none but friendly feelings towards all companies who will assist the needy and be explicit in their mode of doing it, meaning only to acquire the truth, without insidious remarks. *A Tenant for Life.*

*Game Laws.*—I am well aware that I am dealing with a subject equally obnoxious on my side as on that of my reverend opponent, but I have one consolation, I am on the right side. I am also well aware that I have taken the side of common justice; and, moreover, that I have to advocate the cause of those who dare not speak, unless it be anonymously. On this subject I shall take the case of Scotland. Take that of the Carse of Gowrie, where a rent of 3*l.* and 4*l.* per acre is paid. Are there hares and rabbits? Is there any game there? How many game preserves are there in all Scotland, at least as compared to England? In Scotland only a few of the richest noblemen come under the designation. But look into the broad sheets of the *Times*, and there you will see once a year the certificates taken out for England. A 19 years' lease is given, and hares and rabbits left to the mercy of the farmer, without any restrictions. If he chooses to have a few then he cannot turn round upon the landlord. Every farmer is his own keeper. There is no giving back a per centage on account of game, or a bad season; these rest entirely upon his own luck, and he must be regulated by his own judgment, just as the market gardener has no keeper to misrepresent him, just to suit his whim. The worst of all ties are the Game-laws, on account of the temptation they create, and of their suiting the debased and idle habits of the poachers, whom, in many cases, they encourage. I want to know what the Game-laws cost the farmer every year, besides the destruction of his crops, alike as regards charges made upon him and the county, and as regards poachers, their conviction, and the maintenance of their families afterwards?—all which expenses ought to be borne by the game preserver alone. I am not allowed to say a word about crime, but I may say that I have been called out many times at the risk of life, which is the most awful part of it; and if I were to enumerate the destruction of hares and rabbits that takes place, it would not be all the mischief done by poaching—there would still be no end to it. Such things as the eating of corn after the ears or seed stem had begun to grow, the playing and trampling it down for many rods into the field, the making of paths by nipping down the corn on either side, rolling amongst it, keepers walking through, in defiance to the tenant, hunting by horse and foot right across the fields, breaking down gates and fences, destroying whole fields of Turnips, eating up Peas and Beans—in short, there is no end to the grievances; if a farmer were to have his land for nothing, these annoyances, and the expenses of working his land, would be more than he ought to stand. I am told that if a gentleman takes to farming himself, he does not give up game? did Lord Coke do so? did Lord Lyttelton do so? did George Byng do so? does my Lord Stanhope do so? And yet his lordship has as much game as his neighbours; those gentlemen's tenants are proud to save game for such good landlords. There never can be good farming where keepers are kept. I should like to see any man walk over my Strawberry beds! Does a shop-keeper allow any one to take what he likes? Does a manufacturer allow a person to walk over his rooms? Is not a farmer's land his raw material? And after spending his capital upon it, and just when his crops are beginning to show, they are to be destroyed by hares and rabbits. The law of 1848 does not in many cases prevent it; where keepers are, the tenant is still in bondage. I may be asked, why does a farmer agree to take a farm where game is preserved? Why, as population increases, there must be a greater demand for land. Men cannot starve; families increase; sons do not like to remove far off, they risk it for better or for worse, thinking a lease and the Game-laws may one day be done away with. I have not said as yet a word about feathered game, knowing them to be the farmer's best friend (but not in excess), they devour wire worm and all destructive insects; they eat the blade as well as the corn, but they deserve a little, as they are the means of keeping in check all those devouring insects that in time would spread like locusts over whole fields, and devour every green leaf. I have dwelt upon but one side of the picture. Let us now turn for a moment to the other. Spade husbandry and good cultivation must always follow the removal of all bad laws. Vice would diminish. Did any one ever hear of a robbery in the Fulham Fields, where thousands of the poorest of people reside, who are drawn from all countries, and subsist by the sweat of their brow, or hard industry? Will any one tell me that in the best farmed districts of Scotland the farmers have much to pay for the maintenance of idle people? they are unknown. These are some of my reasons for doing away with the Game-laws. A strict game preserver is not satisfied until he sees the hedges of a 5 acre field meeting in the centre: talk of compensation,—take it at 5*s.* per acre, as when game is preserved, will that even pay? does a game preserver allow those 20 feet hedges and ditches which every yard breeds, not only game, but every other description of vermin; every sort of weed thrives and seeds most luxuriantly, shedding the seeds all over every field. I believe those immense breeding hedges are within the measure of the field, and the poor farmer holding 100 acres, actually only has about 85; all those vermin breed in those hedges, and sally out as far as their powers can carry them of a night, devouring everything. Those who do not preserve game, allow the tenant to improve by doing away with those hedgerows, cutting down the ditches, ploughing into the very hedge, and extirpating these game breeding, insect breeding, and weed seeding nurseries, and altogether making the farm much more valuable. Everything goes on pleasantly where game is not preserved; the farmer is proud to send some game to his landlord. I have lived upon six preserving estates, and have never known a farmer well off amongst the whole of them, certainly never independent in either purse or in mind. But until the Game-laws are removed from the statute book, all improvements beside are useless; it is something like putting manure on a clayey undrained field—the goodness will all run off the surface. *J. Cuthill, Camberwell.*

## Farmers' Clubs.

NEWCASTLE, *July.*—MR. HUGH TAYLOR, of Cramlington, read a paper on "*The Oat: Description, Cultivation, Composition, and Uses.*"

All the varieties of the Oat are comprehended in the genus Avena, of which the Oat itself is the type; the genus Avena pertains to the order Gramineæ, or the Grasses. There are many species in the genus Avena, but the following only are cultivated for their seeds:—1st, Avena strigosa, Bristle Pointed Oat, is cultivated as a bread corn in the Orkney and Shetland Islands, and in some parts of the Highlands of Scotland. It is a native of Great Britain. 2, Avena fatua, Wild Oat, is well known as a very troublesome weed. It is sometimes supposed that all the cultivated Oats have sprung from this species, but there appears little foundation for the opinion. It is indigenous to the British islands. 3, Avena brevis, Short Oat, was introduced from Germany in 1804. It grows to the height of only about 9 inches; its seeds are small, but numerous. It is cultivated in the central uplands of France, where it is preferred to every other kind, on account of its early ripening, and of its adaptation to poor soils and exposed situation. 4, Avena nudosa, Naked Oat or Peel-corn, was at one time in general cultivation throughout Scotland and some parts of England; and is supposed to have been the only kind of bread corn known to the ancient inhabitants of Britain. (Rural Cyclopedia.) 5, Avena sterilis, Animated Oat, was introduced from Barbary in 1640; it is only cultivated as a curiosity, and as a bait for salmon. 6, Avena Orientalis, Tartarian Oat, was brought to this country in 1798, and is generally cultivated for horse corn. 7, Avena sativa, common Oat, is the parent of nearly all the varieties cultivated in this country. Every variety in much repute at present has sprung either from the Tartarian or common Oat. From the Tartarian there are the black and white varieties: from the common Oat the Po ato, Poland, Hopetoun, Angus, and others, in all about 40. The varieties of the Oat, then, are very numerous; but as some are adapted to one climate and some to another, it is important that every farmer ascertain the variety best suited to his own locality. The tests by which he may decide are the following: early ripening; produce of meal, grain, and straw; capability of withstanding rain and wind; freedom from disease; strength of straw, to prevent its being lodged; fitness for the soil, temperature, and height above the level of the sea, &c. The introduction of other varieties to this dis rict would, without doubt, prove highly advantageous; for those which have been cultivated for some time in one spot have commonly degenerated from the original sample. The selection of varieties suited to our different soils and situations has been rendered comparatively easy by the many trials recorded in in the agricultural publications of the day. A few of these experiments may be noticed. In a very excellent discussion on Oats, reported in the Highland and Agricultural Society's Journal, Mr. Finnie, one of the best farmers in Scotland, places the varieties in three classes, recommending first, for soils having every advantage of climate, the Potato Oat, Hopetoun, or half of each, the Berlic, Early Angus, Sandy, Black Tartarian, Grey Angus, late Angus, or a mixture of the Hopetoun with the Berlic, Early Angus, Sandy, or Kildrummie; second, for climates of a medium character, Hopetoun, Berlic, Early Angus, Sandy, Early Blainslie, Kildrummie or Dun Oat; third, exposed situations, for which the earliest varieties should always be taken, Early Angus, Berlic, Sandy, Barbachlaw, or Red Oat. In each case the varieties are recommended in the order mentioned, and as best suited to the land as it declines in fertility. Of the produce of the different varieties many trials have been made. On good land, in a favourable situation, Mr. Sutherland, Dalmore, Rossshire, obtained the following quantities:

| | bushels. | | bushels. |
|---|---|---|---|
| From the Dyock | 92 | From the Dun Oat | 73 |
| ,, Berlic | 78 | ,, Early Angus | 68 |
| ,, Late Angus | 77 | ,, Potato | 66 |
| ,, Hopetoun | 76 | ,, Sandy | 62 |

In this experiment the Dyock Oat produced 14 bushels more than any other. The Potato, contrary to what might have been expected, less than any, excepting the Sandy. Mr. Finnie states that in a medium situation he procured, from the same quantity of land, the following produce:—

| | bushels. | | bushels. |
|---|---|---|---|
| Mixture of Hopetoun and Kildrummie | 85 | Kildrummie | 77 |
| ,, Hopetoun and Sandy | 80 | Dun Oat | 76 |
| ,, Hopetoun and Early Angus | 76 | Potato | 74 |
| Early Angus | 77 | Blainslie | 70 |
| | | Hopetoun | 65 |
| | | Sandy | 61 |

In this instance evidence is afforded of the advantage to be derived from a mixture of Oats. The Early Angus gives a greater return than any other variety sown by itself. In Scotland and in the North of England Oats are usually sown on the lea furrow; in some cases, however, a change might be of advantage. On each farm, in this neighbourhood, though the soil be a stiff clay, it is necessary to have a few acres of Turnips, which, it may happen, cannot be carted off in dry weather. Under these circumstances it might be more profitable to sow Oats instead of Wheat on the Turnip land, and to plough early the lea which succeeds, that it may be prepared for Wheat in November. The preparation of the land for Oats should commence so soon as that portion intended for Turnips and bare fallow has been once ploughed; as it is of consequence, more particularly on clay soils, that the land be mellowed by the winter frosts. The lea furrow is considered, both by master and man, the most important ploughing of the year, not only because its good or bad execution is perceptible for so long a period, but because it has a material influence on the quantity and quality of the crop. It is unnecessary to mention the various modes by which the seed-bed may be formed, but I may suggest that, on undrained land, the driest bed, and most certain crop may be secured by gathering up the ridges. For drained land I can recommend, in some measure from experience, a plan in pretty general use in the northern division of this county, but little practised in this district, that of cross ploughing the lea. Four or six weeks previously to ploughing it is marked out at distances of 28 or 30 yards across the ridges. When exposure to air has reduced to powder the soil thus thrown out, it is spread, that no impediment remain to the correct turning of the furrow slice; the land is then ploughed across in the usual manner. An objection sometimes urged, that it is very difficult to turn the land in the old water furrows, and when the ridges are high, can have little weight; as no water furrow should be made on drained land, and as the partial levelling, at least, of the ridges is now considered beneficial. Cross ploughing the lea is preferable, for the following reasons: by the usual methods it is impossible to avoid leaving fast land—a nursery for weeds; but by this, with ordinary attention, none remains. The land is all ploughed at the same depth, or "true ploughed," but this cannot be the case on a ridge set out in the usual manner; a proper distribution of the active soil, which alone promotes vegetation, is maintained over the whole surface—an advantage appreciated by all who have observed the difference between the puny plants of the furrow, in which little soil is left, and the tall well filled Oats of the top ridge, on which has been accumulated more than a fair proportion of active soil. In the northern part of the county the lea is sometimes early ploughed to a considerable

depth, and in spring it is well harrowed, and ribbed across with small ploughs. This method I have found of manifest advantage, the increased produce much more than compensating the excess of labour. The land should not be sown until it is quite dry on the surface, that it may yield readily to the harrow; on the other hand, clay soils must be attentively watched, lest they become too dry. Should the furrow slices not touch other, it is advisable to slightly harrow or roll the land, that the Oats may be placed at the same depth. The seed may be sown either broadcast or by the drill; when by the latter, the land should be well harrowed previously, that it afford an easy passage to the coulters; and the markings of the last "bout" accurately attended to, that a regular distribution of the seed may be obtained. I made use of the drill in a comparative trial with the land ribbed, and with that ploughed in the usual way; and judged only, however, by the eye, that the drilled corn was inferior to both; this result was attributed to the roots being too much crowded together in the narrow rows of the drill. In the experiment the ribbed land carried decidedly the best crop. Oats are sown broadcast, either by hand or by a machine that can readily be adjusted to sow Wheat, Barley, Oats, Peas, or Grass seeds. By the machine the quantity of seed per acre can be regulated with great accuracy; the distribution of the grain is not so much affected by wind; and fewer men are required to sow a given quantity of land. The early or late cutting of the cereal grains has excited much discussion, but it is now pretty generally agreed that the early varieties of Oats should be cut before they are fully ripe, as they suffer much from high winds, and shed their seed easily in the harvest operations; but that, however valuable as fodder the early cutting of late varieties may render the straw, it injuriously affects both the quantity and quality of grain. Great efforts are now being made to diminish, by better methods of feeding, the quantity of Oats necessary for the horse. The object is certainly well worthy attention. It is estimated that a million and a half of horses are employed in Great Britain; supposing that each horse is allowed two bushels of Oats per week, the total quantity consumed is 19,500,000 quarters per annum; worth, at 18s. per quarter, 17,550,000*l*. Assuming it were possible, by improved methods of preparation, to enable the horse to derive as much nourishment from three bushels as he now does from four (and this will subsequently be shown as not impossible) a saving would be effected equal to 4,387,500*l*. per annum. The limits of this paper will not permit a full consideration of the arguments in favour of Oats ground, crushed, boiled, or mixed with chaff; but I may allude to one argument in support of the mixture with chaff, which has not hitherto, I believe, been noticed. Crushed Oats probably pass into the stomach without a due admixture of saliva; ground Oats with scarcely any. But if the Oats, either crushed or whole, are mixed with hay or straw chaff, the proper degree of mastication may be secured. In order to prove that the common methods of feeding do not insure the extraction of all the nutritive matter, I tried the following experiment: The dried fæces of a horse fed in the usual manner were examined by the microscope; they appeared to contain numerous globules of starch; but that conclusive evidence might be afforded of this, the powdered fæces were treated with solution of iodine, when the globules instantly assumed the blue colour so characteristic of the presence of starch. To follow out the experiment, the fæces of a horse fed on Oats mixed with Wheat chaff were examined; the blue colour of the iodide of starch was still exhibited, but the globules were not so numerous as in the first experiment.

## Review.

*Practical Instructions for the Cultivation of the Potato, containing the Competition Essay for the Prize of* 1000 *francs offered by the Belgian Government, &c. &c.* By James Cuthill, Horticulturist, Camberwell. Printed for the Author, and sold by him only.

THE Potato disease seems to be again destroying the produce of the crop. In Gloucestershire, the heaps of "trash," as the unsaleable tubers are technically termed, exceed in number and size those of the marketable crop; and the latter, after a few days, lying together in these heaps, are found to be, at least, one-fourth tainted. Not more than a quarter of the crop appears to be sound.

This will no doubt discourage Potato growers next spring, and induce those who do not intend to be discouraged to take all possible precautions against another failure. For such, Mr. Cuthill's pamphlet is worth many times its cost; and we call attention now to the plans that it proposes, because the present is the period when his treatment of the sets for the future crop commences.

### METEOROLOGICAL REPORT.—SEPTEMBER.

(*Continued from p.* 590.)

* Continuation of previous storm.

† This storm came from the SW. and brought with it the warm fog which the heat of the preceding days had accumulated on the banks at the entrance of the Channel; having travelled over England eastward, the cold back currents brought fog and smoke from London and the German Ocean, but though the weather was extremely threatening and lowering, no rain fell.

‡ A falling barometer, with a very strong and cold northerly wind is such a very unusual coincidence, that I await the result of the present change with a considerable degree of curiosity.

Dorchester, Sept. 18. *F. P. B. M.*

## Miscellaneous.

*M'Cormick's Patent American Reaping Machine* continues to be exhibited, notwithstanding the lateness of the season, in various parts of the country. Last week it was produced, with the greatest success, at Lincoln and Hitchen before thousands of persons; and on Tuesday, of last week, it was tried at Leicester before a large concourse of agriculturists from every part of the midland counties; the locality was a hill-side, and the crop very much laid, still it performed its work to the admiration of all present. On Wednesday, the 10th, it was exhibited at the meeting of the North Lancashire Agricultural Society at Lancaster, where it obtained the first premium. Messrs. Burgess and Key, the representatives of the patentee, have engaged the well-known implement maker, Mr. Samuelson, of Banbury, to manufacture the reapers in this country.

## Notices to Correspondents.

HORSE-HOEING WHEAT: *A Subscriber.* It should be horse-hoed *previous* to the tillering; but even if so late as April when the tillering has commenced it will benefit the crop, because the stirring thus given to the land will, by the consequent tillering, add to the stems of the future crop more than the accidental destruction of plants will diminish them.

POULTRY: *F* and *P D.* The disease is roup, and there is no real cure for it; but it may be alleviated by adopting the following suggestions:—Remove every bird where the eyes are affected, and destroy them; give food moderately of Oat-meal slaked with strong ale, and Garlic, chopped fine, mixed with it; at other times mix a little meal, and add some pounded peppercorns. Diminish the number of fowls, spread plenty of lime on the ground they use, lime-white their roosting places, be careful they are constantly supplied with fresh and clean water, shelter their roosts from east wind. Select the birds you wish to keep, and wash their eyes and nostrils well with strong soap and water; give each of the birds a tablespoonful of the same, and I believe you will save them; but I s rongly advise you to kill all that swell at the eye, till blind; as nothing will cure them; they are at the last stage, and it is only at the commencement that anything can be done.—*W W.* If you have another cock fit to take the place of the diseased bird, the best and safest plan would be to kill him; if you have not, the best plan would be frequently to take a stiff tail or wing feather, and after stripping the feather from the quill, with the exception of an inch at the extremity, to push it down the throat till it reaches the diseased part; twist it sharply round several times, and pull it out quickly; if nothing adheres to it, give a dessert spoonful of castor-oil; if anything does, I fear it is a hopeless case, and that the disease is incurable; but good may in either case be done by oiling the throat with a feather two or three times every day. I would strongly advise the bird should be kept from the other fowls, as most of these complaints are contagious.—*Emma.* Poultry shut up in a gravel yard require generous feeding, as they lack much they would find if they were at liberty. It is always bad policy to buy bad food, as a smaller quantity of good quality will last longer, and feed the fowls better. It is difficult to say how much four fowls will eat in a month, as it depends much on whether they can get anything besides what is given by hand. In an enclosed yard, nothing is better for the health of fowls than a basket of bricklayers' rubbish thrown down, they pick out pieces of mortar and they roll in the dust, which is essential to them. It is bad to confine fowls to one food, and it is therefore always useful to give them groats from which gruel has been made, bread that has been used for toast and water, occasionally Potatoes, and such other things of like character as are in constant use where there is a family. It is not only an economy, but it promotes health. Early hatched pullets of this year will soon begin to lay. *J. Baily,* 113, *Mount-street.*

RUSSIAN AGRICULTURE: *G.* Will you kindly forward your address? It has been mislaid.

SHEEP: *H B.* You have, say, 230 tons of Turnips; deduct loss by rotten roots, imperfect consumption, and call them 200 tons. An ordinary sheep will eat, out of doors, ¼ cwt. daily, or 25 cwt. in the 100 days between 20th November and 1st March; therefore purchase 160 sheep.

## Markets.

### COVENT GARDEN, SEPT. 20.

Peaches are plentiful, but Nectarines are scarcer; the best samples fetch 8s. and 10s. a dozen. Pines and Grapes are abundant. A few West Indian Pines have again made their appearance. Morello Cherries are still furnished, but in very small quantities. Greengage Plums are scarce, as are also Oranges and Lemons. Nuts remain nearly the same as quoted last week. Carrots, Turnips, Cabbages, &c., are sufficient for the demand. Potatoes are good in quality, and, remain tolerably free from disease. Lettuces and other salading are sufficient for the demand. Mushrooms (bushels) are beginning to appear. Cut flowers consist of Heaths, Pelargoniums, Mignonette, Heliotropes, Stephanotis, Moss and Provins Roses.

FRUIT.

HOPS.—FRIDAY, Sept. 19.

Messrs. Pattenden and Smith report that the market is now moderately supplied with new Hops, and all good samples sell freely at the following prices:

Weald Kents ... 130s to 140s | Sussex ... ... 120s to 130s

Very choice, higher. Duty 110,000*l.* to 115,000*l.*

SMITHFIELD, MONDAY, Sept. 15.

The supply of Beasts was large, but complaints still exist as to the quality. Consequently, choicest descriptions were disposed of at about late rates; but middling kinds were lower, and many remain unsold. The number of Sheep was larger; trade was very heavy, and prices were lower. Lamb is almost out of season; very little is wanted, at lower rates. Good Calves were rather more in demand. From Holland and Germany there are 1730 Beasts, 4250 Sheep, 175 Calves, and 290 Pigs; from Spain, 520 Sheep; from Scotland, 20 Beasts; and 3000 from the northern and midland counties.

| Per st. of 8 lbs.—s d s d | Per st. of 8 lbs.—s d s d |
|---|---|
| Best Scots, Here- | Best Long-wools . 3 4 to 3 6 |
| fords, &c. ... 3 4 to 3 6 | Ditto Shorn ... ... |
| Best Short-horns 3 0 — 3 2 | Ewes & 2d quality 2 8 — 3 0 |
| 2d quality Beasts 2 4 — 2 8 | Ditto Shorn ... ... |
| Best Downs and | Lambs ... ... 4 0 — 4 8 |
| Half-breds ... 3 8 — 3 10 | Calves ... ... 2 4 — 3 8 |
| Ditto Shorn ... ... | Pigs ... ... 3 0 — 4 0 |

Beasts, 5087; Sheep and Lambs, 34,190; Calves, 280; Pigs, 610.

FRIDAY, Sept. 19.

We have a large supply of middling Beasts and very little trade for them, this description being sold exceedingly low at the dead markets. A considerable number remain unsold. The number of Sheep is large for the time of year; prices are on the average lower. Calves are plentiful and rather cheaper. From Germany and Holland we have 713 Beasts, 1920 Sheep, 357 Calves, and 75 Pigs; from Spain, 7 Beasts and 440 Sheep; 250 Beasts from the northern and midland, and 116 milch cows from the home counties.

| Best Scots, Here- | Best Long-wools . 3 2 — 3 6 |
|---|---|
| fords, &c. ... 3 4 to 3 6 | Ditto Shorn ... ... |
| Best Short-horns 3 0 — 3 4 | Ewes & 2d quality 2 4 — 3 0 |
| 2d quality Beasts 2 0 — 2 6 | Ditto Shorn ... ... |
| Best Downs and | Lambs ... ... 4 0 — 4 4 |
| Half-breds ... 3 6 — 3 10 | Calves ... ... 2 4 — 3 6 |
| Ditto Shorn ... ... | Pigs ... ... 3 0 — 4 0 |

Beasts, 1226; Sheep and Lambs, 8,580; Calves, 569; Pigs, 520.

MARK LANE.

MONDAY, SEPT. 15.—The supply of Wheat from Essex to this morning's market was moderate, and from Kent large; a few samples were disposed of at the opening on the terms of this day se'nnight, but owing to a large quantity offered from Cambridgeshire and Lincolnshire, say 63—64 lbs. Wheats, at 38s. per qr. delivered, the market became heavy, and the stands could not be cleared at a late hour, even at a decline of 1s. per qr. Business in foreign was very limited, and in the few sales effected, slightly reduced rates were accepted.—In the value of Barley, Beans, or Peas, English or foreign, we observe no alteration.—Oats meet an improved demand; fine qualities and Russian must be written 6d. per qr. dearer.—The Flour trade is heavy, and the top price of town made reduced to 37s. per sack.

FRIDAY, SEPT. 19.—The arrival of English Wheat this week has been more liberal than for some time past. Of foreign it was moderate, but of other grain small. The attendance at market to-day was thin, and the English Wheat left over from Monday was held at that day's prices, without finding buyers. The sale for foreign has been limited at nominally late rates. —Spring Corn of all sorts fully maintains its value. There is an increased inquiry for Flour at about Monday's prices.—There has been very little doing in Black Sea Wheat afloat; a cargo of Egyptian made 23s. 6d. per qr. The demand for Indian Corn has fallen off since Monday.

LIVERPOOL, TUESDAY, SEPT. 16.—Upon a slender attendance of home and country millers at our market this morning, English and foreign old Wheat of all descriptions continued to meet a very slow limited demand, at a decline of 1d. per 70 lbs. from the currency of Tuesday last. New samples, which from the neighbouring growers were rather numerous, receded also 1d. to 2d., but the quality and condition being excellent, a tolerable clearance was made, and the few parcels of Irish at hand were disposed of at a similar abatement. Choice marks of French Flour, though not readily saleable to-day, were held at late prices. Barley, Malt, and Peas move very sparingly at former rates, and Beans of all descriptions decline 1s. per qr. Oats, of which few remain here, nominally supported late prices; Oatmeal, on the contrary, giving way 6d. to 1s. per load. Indian Corn, meeting an improved demand, higher prices were firmly required.——FRIDAY, SEPT. 12.—The weather continues of the most splendid character for the securing of our northern harvest. At our Corn Exchange this morning the business was only moderate. Old foreign Wheat was neglected, and a trifle easier, but American barrel Flour was fully as dear as on Tuesday, the late low sellers having been pretty well relieved, and a large quantity has gone into very extended districts. Oats and Oatmeal were scarce. There was not much demand for Indian Corn, and no change in price.

GLASS FOR CONSERVATORIES,
GREENHOUSES, PIT FRAMES, &c.

JAMES PHILLIPS AND CO. beg to hand in their prices of SHEET GLASS for cash:

Cut to order in Panes not above 40 inches long.

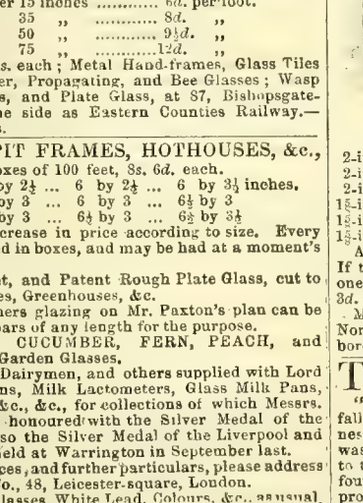
4½ by 3½ ... 5½ by 3 ... 6½ by 3 ... 6½ by 3½

Larger Squares increase in price according to size. Every size kept ready packed in boxes, and may be had at a moment's notice.

Extra Crown, Sheet, and Patent Rough Plate Glass, cut to size for Conservatories, Greenhouses, &c.

Gardeners and others glazing on Mr. Paxton's plan can be supplied with Sash-bars of any length for the purpose.

PROPAGATING, CUCUMBER, FERN, PEACH, and every description of Garden Glasses.



Bailiffs, Farmers, Dairymen, and others supplied with Lord Camoy's Milk Syphons, Milk Lactometers, Glass Milk Pans, Glass Tiles, Slates, &c., &c., for collections of which Messrs. COGAN and Co. were honoured with the Silver Medal of the Dublin Society, as also the Silver Medal of the Liverpool and Manchester Society held at Warrington in September last.

For Estimates, Prices, and further particulars, please address Messrs. COGAN and Co., 48, Leicester-square, London.

Glass Shades, Gas Glasses, White Lead, Colours, &c., as usual.

ARTIFICIAL STONE for the DECORATION OF GARDENS.

AUSTIN AND SEELEY respectfully call the attention of the nobility and gentry to the facilities now offered by the manufacture of their "ARTIFICIAL STONE" for the Decoration of Gardens, at a moderate expense. The material, which is a lime concrete, perfectly waterproof, has now been tried extensively in Scotland for 20 years past, and the fact that they never had a complaint from thence encourages the Manufacturers to recommend it more actively than they have hitherto done.

The Stock consists of an immense variety of objects suitable for detached Garden Ornaments, or for connection with Architectural Erections—such as Balustradings, Porticoes, &c. The more generally useful portion may be enumerated as follows, viz.:—

193 Vases and Tazzas, from 10s. to 30l.
70 Statues, from 2 feet high to a colossal size.
15 Baskets, with suitable pedestals.
34 Figures of Animals.
12 — Birds.
A collection of Fountains (perhaps unprecedented) from 5l. to 400l.
Jardinieres, or large Bowls for Masses of Flowers.
Sun Dial Pillars.
Shells from 4s. to 12 guineas.
Coats of Arms, and Crests for Gate Piers.
Border Edging.
Garden Seats.
Capitals for Columns.
Flower Boxes made to measurement.

☞ Gentlemen wishing for patterns are requested to state, with respect to Fountains, the power of water they can obtain; and with respect to Vases or Figures, the sizes of the pedestals on which they are meant to stand.

Manufactory, No. 1-4, Keppel Row, New Road, Regent's Park, London.

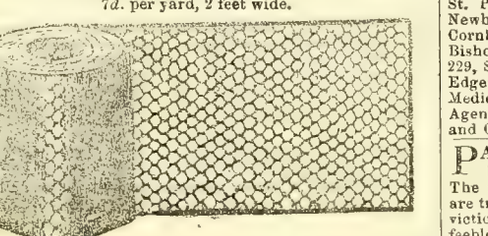
COCHIN CHINA FOWLS.—A few pure bred Cock Birds, hatched early this spring, are for sale at 12s. 6d. each, including basket for transmission.—Application as to breed, &c., to be made (prepaid), and the price to be remitted by Post-office Order, on Carlisle, to THOMAS KNOX, Gamekeeper, Barrack Park, Carlisle.

PURVEYOR TO HER MAJESTY, H.R.H. PRINCE ALBERT, AND THE KING OF THE NETHERLANDS.

JOHN BAILY, 113, Mount-street, Grosvenor-square, London, Dealer in all sorts of USEFUL AND ORNAMENTAL POULTRY; Domesticated Wild Fowl; Gold, Silver, and common Pheasant Eggs for Hatching; all sorts of Fancy Fowls' Eggs, large Aylesbury Ducks, &c.

BAILY'S registered PHEASANT AND POULTRY FOUNTAINS, by which Birds are ensured a supply of clean and wholesome water, and the lives of thousands of Chickens and Pheasant Poults saved—1¼ quarts, 17s. 6d.; 7 quarts, 15s. 6d.; 3 quarts, 13s. 6d. Drawings and particulars forwarded by post on application.

BAILY'S "Hints for the Management and Fatting of the Dorking Fowls for the Table," price 1s. 6d.



BAKER'S PHEASANTRY, Beaufort-street, Kings'-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shoveller, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street, London.

EXHIBITION, CLASS 9, No. 89 (SOUTH SIDE).

GARDEN ENGINES, MACHINES, & SYRINGES, on the most improved principle. Manufactured only by RICHARD READ,
Instrument Maker (by special appointment) to her Majesty,
35, REGENT-CIRCUS, PICCADILLY, LONDON.

CAUTION.—As instruments of the commonest description are extensively circulated throughout the country, and sold as "READ'S," please observe that none are genuine except stamped with the Royal Arms, and the words READ'S PATENT.

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised sparrow-proof netting for Pheasantries, 3d. per square foot. Patterns forwarded post free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

THE HAIR.—LOST AND RESTORED.—"Newport, Isle of Wight, Sept. 6, 1848.

"Gentlemen,—Some three months since, finding my hair falling off by nearly handsful, and my head approaching baldness; in fact, being quite bald at the crown and on the sides, I was induced, through my hairdresser, Mr. Beach, of this place, to try your BALM OF COLUMBIA, and after persevering with four bottles, according to your directions, I found a new crop produced, which has now restored my head to its former appearance. As I had apprehended a total loss of my hair, I feel it due to the virtues of your Balm of Columbia thus publicly to bear my testimony. Mr. Beach, who recommended me, is the same who used it successfully in Mr. Wilson's case, whose testimony you have lately published. Mr. B. is a Lymington man; I am also a native of that place, though for the last ten years in practice here as a solicitor.—Yours, &c. H. RICE.

"To Messrs. C. & A Oldridge."

For the strengthening of weak hair, its restoration when thinly scattered, or falling off and consequent general improvement and embellishment, the powers of OLDRIDGE'S BALM OF COLUMBIA are known by the continually increasing numbers who are testing its merits, as powerfully and unfailingly efficient.—Price 3s. 6d., 6s., and 11s. per bottle. No other prices are genuine. Ask for OLDRIDGE'S BALM, and never be persuaded to use any other article as a substitute.

13, Wellington-street North, seven doors north of the Strand.

HOUSE FURNISHING AND INTERIOR DECORATIVE ESTABLISHMENT, 451, OXFORD-STREET, LONDON.—Cabinet Furniture of every description at marked prices—Brussels Carpet, 2s. 6d. per yard.—Damask Curtains, 10d. per yard and upwards; Ditto, in Silk and Worsted (French fabric), nearly two yards wide, at 8s. per yard.—The best Floor Cloths that can be made, cut to any dimensions, 2s. 3d. per yard. The largest Manufactory in London for Paper Hangings, English and French Decorations, adapted either to the Cottage or the Mansion, fitted up, showing the side of a room finished for occupation.

"FRIGI DOMO."—A Canvas, made of prepared Hair and Wool, a perfect non-conductor of Heat and adapted to many Horticultural and Floricultural purposes for covering over frames where a fixed temperature is required. It is 2¼ yards wide, and of any required length, at 1s. 4d. per yard run.—Manufactured only by E. T. ARCHER, Carpet Manufacturer, 451, New Oxford-street, London.

GOOD NEWS FOR THE AFFLICTED.

DR. ROBERTS'S CELEBRATED OINTMENT, called the "POOR MAN'S FRIEND," is confidently recommended to the Public as an unfailing remedy for Wounds, of every description, a certain cure for Ulcerated Sore Legs, if of 20 years' standing; Cuts, Burns, Scalds, Bruises, Chilblains, Scorbutic Eruptions and Pimples in the Face, Sore and Inflamed Eyes, Sore Heads, Sore Breasts, Piles, Fistula, and Cancerous Humours, and is a specific for those afflicting Eruptions that sometimes follow Vaccination. Sold in pots, at 1s. 1½d., and 2s. 9d.—Also, his PILULÆ ANTISCROPHULÆ, confirmed by more than 40 years' experience, to be without exception one of the best alterative medicines ever compounded for purifying the blood, and assisting Nature in all her operations. Hence they are useful in Scrofula, Scorbutic Complaints, Glandular Swellings, particularly those of the Neck, &c. They form a mild and superior family Aperient, that may be taken at all times without confinement or change of diet. Sold in boxes at 1s. 1½d., 2s. 9d., 4s. 6d., 11s., and 22s. each. Sold wholesale by the proprietors, BEACH AND BARNICOTT, at their Dispensary, Bridport, and by the London houses; retail by all respectable Medicine Vendors in the United Kingdom. Observe—No medicine sold under the above name can possibly be genuine, unless "Beach and Barnicott's, late Dr. Roberts, Bridport," is engraved and printed on the stamp affixed to each package.

WARMING AND VENTILATING FOR CHURCHES, CONSERVATORIES, AND OTHER BUILDINGS.—The most efficient and economical Hot-water Apparatus, supplied and erected for the above purposes, fitted with improved boilers, requiring no brick-work, capable of working 14 hours without attention. Also the THERMANTERION, a cheaper and simpler apparatus, especially adapted for buildings only used occasionally.—Apply to SPILLER and TAYLOR, Battersea, near London.

ZOOLOGICAL GARDENS, REGENT'S PARK.—The URAN UTAN, presented by the Governor of Singapore, is exhibited daily from 12 to 6 o'clock, together with the ELEPHANT CALF, and the HIPPOPOTAMUS, presented by His Highness the Viceroy of Egypt. The Band of the First Life Guards will perform, by permission of Colonel Hall, at half-past 3 o'clock, on every Saturday, until further notice. Admission 1s. ON MONDAYS 6d.

COMFORT FOR TENDER FEET, AND A CERTAIN CURE FOR CORNS AND BUNIONS.

PAUL'S EVERY MAN'S FRIEND,
Patronised by the Royal Family, Nobility, &c.

PAUL'S EVERY MAN'S FRIEND, which gives relief on the first application. Paul's Every Man's Friend (Corn Plaister) is generally admitted to be the best emollient application for Corns and Bunions, and is worthy of a trial on the part of those who are afflicted with such unpleasant companions. Testimonials have been received from upwards of 100 physicians and surgeons of the greatest eminence, as well as from many officers of both army and navy, and nearly 1000 private letters from the gentry in town and country, speaking in high terms of this valuable remedy.

Prepared by JOHN FOX, in boxes, 1s. 1½d., or three small boxes in one for 2s. 9d.; and to be had, with full directions for use, of all wholesale and retail Medicine Vendors in town and country. The Genuine has the name of "JOHN FOX" on the Government Stamp. A 2s. 9d. box cures the most obdurate Corns. Ask for "Paul's Every Man's Friend."

Sold by Barclay and Sons, Farringdon-street; Edwards, 67, St. Paul's Churchyard; Butler and Harding, 4, Cheapside; Newberry, St. Paul's; Sutton, Bow Churchyard; Johnston, 68, Cornhill; Sanger, 150, Oxford-street; Willoughby and Co., 61, Bishopsgate-street Without; Eade, 39, Goswell-street; Prout, 229, Strand; Hannay and Co., 63, Oxford-street; Watts, 106, Edgeware-road; and retail by all respectable Chemists and Medicine Vendors in every Town in England. Wholesale Agents for Ireland and Scotland, Messrs. J. and R. RAIMES and Co., Druggists, Edinburgh.

PARR'S LIFE PILLS are acknowledged to be the best Medicine in the World. 30,000 boxes sold weekly.—The fine balsamic and invigorating powers of this Medicine are truly wonderful; a trial of a single dose will carry a conviction that they are all that is necessary to invigorate the feeble, restore the invalid to health, and to do good in all cases. The heads of families should always have them in the house, as they may, with the greatest confidence, be resorted to at any time or in any case. BILIOUS DISORDERS.—These Pills are all-powerful in removing the distressing symptoms attendant upon bilious obstructions, disordered state of the stomach and bowels, such as pains in the head, dimness of sight, sickness, oppression of the chest, lowness of spirits, disinclination for active employment, and various other symptoms at all times troublesome, and not unfrequently dangerous. By taking two or three doses of OLD PARR'S LIFE PILLS, the symptoms above described are speedily removed, an unusual degree of serenity pervades the mind, the stomach and bowels are restored to their natural functions, and returning vigour is the result. None are genuine unless the words "PARR'S LIFE PILLS" are in White Letters on a Red Ground, on the Government Stamp, pasted round each box; also the fac-simile of the signature of the Proprietors, "T. ROBERTS and Co., Crane-court, Fleet-street, London," on the Directions. Sold in boxes at 1s. 1d., 2s. 9d., and family packets at 11s. each.

THE GREAT EXHIBITION.—HINTS TO VISITORS.—Among the tens of thousands who will grace the Industrial Fair, every nation will contribute bright samples of its youth, beauty, and fashion. The frequenters of the Ball, the Public Assembly, and the Promenade, will find both personal comfort and attraction promoted by the use of ROWLAND and SONS' valuable aids; and what better mark of esteem can be offered to their return home, as a memento of the Great Exhibition, than a packet of "ROWLANDS' UNIQUE DISCOVERIES."

ROWLANDS' MACASSAR OIL,
For the growth, and for preserving, improving, and beautifying the Human Hair.

ROWLANDS' KALYDOR,
For improving and beautifying the Skin and Complexion, eradicating all Cutaneous Eruptions, Sunburn, Freckles, and Discolorations, and for rendering the Skin soft, clear, and fair.

ROWLANDS' ODONTO,
Or PEARL DENTIFRICE, for preserving and beautifying the Teeth, strengthening the Gums, and for rendering the Breath sweet and pure. Price 2s. 9d. per box.

BEWARE OF SPURIOUS IMITATIONS.
The only GENUINE of each bears the name of "ROWLANDS'," preceding that of the article on the Wrapper or Label.
Sold by A. ROWLAND and SONS, 20, Hatton-garden, London; and all Chemists and Perfumers.

THE GREAT EXHIBITION.—A valuable, newly invented very small powerful Waistcoat-pocket Glass, the size of a Walnut, to discern minute objects at a distance of from four or five miles, which is found to be invaluable at the Exhibition, and to SPORTSMEN, GENTLEMEN, and GAMEKEEPERS. TELESCOPES.—A new and most important INVENTION in TELESCOPES, possessing such extraordinary powers, that some, 3½ inches, with an extra eye-piece, will show distinctly Jupiter's moons, Saturn's ring, and the double stars. They supersede every other kind, and are of all sizes—for the Waistcoat-pocket, Shooting, Military purposes, &c. Opera and race-course Glasses, with wonderful powers; a minute object can be clearly seen, from 10 to 12 miles distant.—In valuable newly-invented preserving Spectacles, invisible and all kinds of acoustic instruments for relief of extreme deafness. Messrs. S. and B. SOLOMONS, Opticians and Aurists, 39, Albemarle-street, Piccadilly, opposite the York Hotel, London.

METCALFE AND Co.'s NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1s. An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY and Co.'s, Sole Establishment, 130 B, Oxford-street, one door from Holles-street.

METCALFE'S ALKALINE TOOTH POWDER, 2s. per box.
CAUTION.—Beware of the words "From METCALFE'S," adopted by some houses.

*SALES BY AUCTION.*

AN IMPORTATION OF PLANTS FROM WESTERN AFRICA.

MR. J. C. STEVENS will sell by Auction, at his Great Room, 38, King-street, Covent Garden, on MONDAY, September 22, at 2 o'clock precisely, 12 Glazed Cases of Orchids Aquatics, Flowering Shrubs, Fruits, and other Plants, collected in Western Africa, by THOMAS WHITFIELD, Esq., by whom they have just been brought over in good health; dried specimens and drawings of many of them will be exhibited at the Sale; they may be viewed on Saturday before the Sale, and Catalogues had.

THE COLLECTION OF RARE AND VALUABLE ORCHIDACEOUS PLANTS AT KNOWSLEY, THE PROPERTY OF THE LATE RIGHT HON THE EARL OF DERBY, K.G.

MR. J. C. STEVENS is honoured with instructions to Sell by Auction, in the Gardens at Knowsley, about six miles from Liverpool, on SATURDAY, 4th October, at 12 o'clock precisely, the Rare and Choice COLLECTION OF ORCHIDS, including most of the popular East Indian, South American, Mexican, and African varieties. The Plants are all well established and in fine health, and may be viewed the day before the Sale, by applying to Mr. JOHN JENNINGS, at the Gardens, Knowsley; and Catalogues had there and of Mr. J. C. STEVENS, 38, King-street, Covent Garden, London. The Huyton Station on the Liverpool and Manchester Railway is about two miles from Knowsley.

TO ZOOLOGISTS.—KNOWSLEY PARK, NEAR LIVERPOOL.—NOTICE OF SALE, BY AUCTION, OF THE RENOWNED MENAGERIE AND AVIARY, FORMED BY THE LATE RIGHT HON. THE EARL OF DERBY, K.G., PRESIDENT OF THE ZOOLOGICAL SOCIETY OF LONDON.

MR. J. C. STEVENS is honoured with instructions from the Executors of the late Noble Earl, to sell by public Auction, on the premises, Knowsley, 6 miles from Liverpool, on MONDAY, October 6, and many following days, the whole of the LIVE ANIMALS AND BIRDS contained in the KNOWSLEY MENAGERIE, excepting only the five Eland Antelopes, selected by the Zoological Society of London, and one specimen, or series, to be selected by her Majesty, in pursuance of a desire expressed by the late Earl. This collection is admitted by Zoologists to be the finest extant; it numbers upwards of 1600 examples, including an unique collection of the rarest Antelopes, Deer, Indian Cattle, Zebras, Llamas, Alpacas, &c., which are particularly deserving the attention of Noblemen and Gentlemen, as ornamental specimens for the Park.—May be viewed, by Catalogues (price 5*s.* each), to admit one person, only, to the view, on Monday, the 29th inst., or either of the five following days; these may be had by persons intending to purchase, at the Office, Knowsley Hall; and of Mr. J. C. STEVENS, 38, King-street, Covent-garden, London.

ISLINGTON NURSERY.—TO NOBLEMEN, GENTLEMEN, NURSERYMEN, BUILDERS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed by the proprietor to offer to public competition, by Auction, early in October, on the premises, in consequence of the land being let for building, the whole of the valuable NURSERY STOCK, comprising several thousand Scarlet, White, and Hybrid Rhododendrons, Ghent and other Azaleas, Variegated and Green Hollies of various sizes, in considerable quantities, several thousand Aucuba japonica, from 1 to 4 feet, a large quantity of fine Mulberries of different ages, many of which are fine bearing trees, &c. Further particulars in future Advertisements.

American Nursery, Leytonstone, Essex, September 20th.

CHELSEA.

IMPORTANT FINAL SALES, IN CONSEQUENCE OF THE EXPIRATION OF THE LEASE.

TO GENTLEMEN, NURSERYMEN, AND OTHERS.

MR. D. A. RAMSAY has received instructions from Messrs. Dennis and Co. to submit to public competition, on the premises, opposite Cremorne Gardens, King's-road, Chelsea, on TUESDAY, September 23, and following day, at 1 o'clock, all that very valuable and extensive stock of GLASS, comprising the erections of Greenhouses and Pits, fitted up with Stages and all necessary Heating Apparatus, Garden Frames, Lights, Sheds, &c.; also the justly celebrated collection of Greenhouse Plants, consisting of Geraniums of the most choice varieties, Azalea, Camellia, Aloes, Cacti, large specimen Yuccas, &c., forming a collection rarely to be met with, including large Scarlet Rhododendrons, Evergreens of sorts, Roses in great variety, Jasmine, Ivies, and other Climbers, in pots. The stock of this old-established Nursery needs no further recommendation than the name; and Mr. D. A. RAMSAY, in calling the attention of the public to this and the following Sales, has only to observe, that in consequence of the Lease expiring at Christmas next, and the ground being required for building purposes, the Stock must be positively sold without reserve. The other Sales will take place in October and November, comprising the remaining Nursery Stock, including the largest and finest collection of Mulberry Trees in the country, choice Gooseberries, Evergreens, and other Miscellaneous Stock, of which due notice will be given.—May be viewed prior to Sale, and Catalogues had, on the premises, at the principal Seed Shops, and of the Auctioneer, Brompton Nursery, Fulham-road, Brompton.

STANHOPE NURSERY, GLOUCESTER-ROAD, OLD BROMPTON.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, BUILDERS, AND OTHERS ENGAGED IN PLANTING.

MR. J. RAWLINGS has received instructions from Mr. Wm. Siggers to submit to public competition, by Auction, on the premises, as above, on MONDAY, October 6, and following days, at 11 o'clock each day (in consequence of the Lease having expired), the whole of the valuable NURSERY STOCK, consisting of many thousands very fine Aucuba japonica, Laurel, Laurustinus, Yew, Arbor Vitæ, Holly, &c.; Fruit and Forest Trees, American Plants; Standard, Dwarf, and Pillar Roses; Irish Ivy, some very large Camellias and Scarlet Rhododendrons in pots, &c. Also a handsome Chesnut Mare, a capital light Spring Van, with top complete, and other effects.—May be viewed prior to the Sale. Catalogues (6*d.* each, returnable to purchasers) may be had on the premises; of the principal Seedsmen; and of the Auctioneer, 50, Hoxton-square; and Ebenezer Nursery, Shacklewell, London.

N.B. The whole of the Greenhouse Plants, Greenhouses, Utensils in Trade, &c., will shortly be submitted to public competition, of which due notice will be given.

TO NURSERYMEN AND FLORISTS.

MR. WHITTLE is instructed by the Executors to Sell an old-established (Copyhold) NURSERY, FLOWER GARDEN and SEED SHOP, about 10 miles from Cambridge, and 4 from a Railway Station. An extensive business is carried on. The property consists of a good Dwelling House, large Greenhouse, and Forcing Pit, heated by hot water; Forcing Frames, extensive Ornamental Flower Gardens, and Nursery Grounds, stocked with a fine assortment of Greenhouse and Border Plants, Bulbs, Shrubs, Evergreens, and Forest Trees of every description, and well studded with bearing Fruit Trees, Bushes and Plants, Ornamental Trees, Rockwork and Pond, fine cut Yew, and other Arbours and Hedges; also three Cottages, &c., close to good markets.—Further particulars of Mr. WHITTLE, Auctioneer, &c., 45, Old-street, St. Luke's, London.

**THE FIRST VOLUME OF THE**

# HOUSEHOLD NARRATIVE OF CURRENT EVENTS.

Price 3*s.*, in cloth.

PUBLISHED AT 16, WELLINGTON-STREET NORTH, STRAND.

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

TO BE LET, a Farm, in the county of Wilts.—The Farm comprises a commodious Dwelling-house, extensive Outbuildings, and about 314 acres of Land, for the most part of superior quality, of which about 205 acres are Meadow and Pasture, and 109 Arable. The estate is undergoing thorough drainage. The Farm will be let from Michaelmas next on lease, if desired, for 14 or 21 years.—For further particulars, and to treat for a lease, apply to Messrs. LAWRENCE, Cirencester.

HAMPSHIRE.

EXCELLENT RESIDENCE IN A HUNTING COUNTRY, WITH OR WITHOUT A GOOD FARM.

TO BE LET, with immediate possession, all that capital and highly-desirable RESIDENCE, known as "MARWELL LODGE" (recently put into substantial repair), with a Lawn, walled-in Garden, and about 35 acres of good productive Land, immediately surrounding the House. And also, if required, all that FARM, called "MARWELL FARM," comprising a Farm House, two good Homesteads, and sundry Cottages; and about 420 acres of Land, whereof 360 acres are Arable, 37 acres Meadow and Pasture, and 23 acres Wood Land. Marwell Lodge is pleasantly situate near to Owslebury, four miles distant from the Bishopstoke Station on the South-Western Railway, six miles from Botley, and six from Winchester, and within easy reach of three packs of Foxhounds.

To view the Property, apply at Marwell Hall, and to treat for the same, to Messrs. ATTWOOD and RIGDEN, the Close, Salisbury.

TO BE LET, a DESIRABLE FARM of 260 Acres, at a low rent, with immediate possession. It is situate in Cambridgeshire, eight miles from a station on the Great Northern Railway, and consists of about 200 acres of excellent arable, and 60 acres of Grass land. The homestead comprises a capital brick-built residence of handsome elevation, which has recently undergone a thorough repair, and contains two good sitting-rooms, and six bed-rooms. The farm buildings are ample, and in good order. A small farm of about 90 acres (50 arable and 40 Grass) may be had with the foregoing if required, together with the newly erected and excellent farm buildings, the whole forming a most complete and profitable holding. For particulars apply to Mr. CHARLES J. BAKER, Auctioneer and Estate Agent, 18, Lower Brook-street, Grosvenor-square, London.

PARADISE NURSERY, HORNSEY-ROAD, ISLINGTON.

THIS Desirable NURSERY TO BE LET, or the LEASE TO BE SOLD, in consequence of the Proprietor being about to retire from the Nursery Business. With immediate occupation. The whole may be taken at a valuation, or by private contract.—Apply personally, or by letter, to W. J. PAMPLIN, on the premises, opposite the new intended Finsbury-park.

SUPERB HOLLYHOCKS.

R. B. BIRCHAM, Hedenham Rosary, Bungay, Suffolk, begs to state that his Descriptive CATALOGUE of the above splendid flowers is now ready, containing all the best in cultivation, and including some first-rate Seedlings.

R. B. B. begs to offer strong ground roots, selected when in bloom, from some thousands of seedlings; these are fine double flowers and splendid colours, and will prove a superior class of flowers for the border and shrubbery; 9*s*. per dozen.

A Descriptive Catalogue of the best Roses in cultivation, including upwards of 300 of the best hardy varieties. R. B. B. will be happy to forward the above lists on prepaid application. Package carefully attended to; extra plants included, to compensate for distant carriage. Carriage paid to London per Norfolk railway.

JOHN AND CHARLES LEE'S Catalogue of STOVE and GREENHOUSE PLANTS is just published, and may be had post free on application, enclosing two postage stamps.

Nursery, Hammersmith.

Paris, le 31 Juillet, 1851.

LE PROFESSEUR CLEMENTI a l'honneur de prévenir les Botanistes que, dans le mois de Septembre prochain, il pourra mettre à la disposition des Amateurs la COLLECTION des PLANTES recueillies par lui dans son dernier voyage sur l'Olympe bythinique et en d'autres contrées de l'Orient. Le prix de la Centurie est de 35 francs, y compris un exemplaire du SERTOLUM OLYMPICUM, contenant la description de quelques espèces nouvelles, et des observations sur les plus remarquables. La Collection tout entière a été soigneusement étudiée, et les espèces qui la composent, au nombre d'environ 125 à 150, ont été nommées avec autant d'exactitude que possible, avec le concours des savants botanistes, MM. Gay, Spach, Webb, que tout le monde sait fort habiles dans la connaissance de Plantes de ces contrées.

MM. les Souscripteurs sont priés de s'addresser—A Paris, à M. B. Webb, Avenue de Marbeuf, 15; à Gênes, à M. le Professeur de Notaire; en Angleterre, chez M. R. Heward, 5, Young-street, Kensington.

WILLIAM E. RENDLE, NURSERYMAN and FLORIST, by royal permission, to her MOST GRACIOUS MAJESTY THE QUEEN, his MAJESTY THE KING OF THE BELGIANS, the NEPAULESE PRINCES, who honoured the Gardens with a visit on the 30th of July, 1850.

*The following letter is from Colonel the* Hon. C. B. PHIPPS.

"Buckingham Palace, May 29th, 1851.

"SIR,—I beg to acquaint you that the Plants mentioned in your letter of the 23d inst arrived quite safely, and were much admired by the Queen.—I am, Sir, your obdt. humble servant,

"C. B. PHIPPS."

WILLIAM E. RENDLE, Nurseryman, Plymouth, has much pleasure in stating that he has just received a most extensive collection of DUTCH FLOWER ROOTS in excellent condition from one of the first establishments in Holland.

CARRIAGE FREE!!! (See below).

*The Hyacinths are particularly large and handsome, and will be sure to give the greatest satisfaction to all parties.*

| Single Mixed | 4 | 0 | | | |

With all the best varieties of Early and Double Tulips—Polyanthus Narcissus, Jonquils, Iris, Dutch Crocus, Crown Imperials, Liliums, Gladiolus, Ixias and Sparaxis, with all the other varieties of Dutch and Cape Bulbous Roots—at prices equally moderate.

A DESCRIPTIVE CATALOGUE OF HYACINTHS AND OTHER BULBOUS ROOTS, WHICH AT THE SAME TIME GIVES SOME GOOD CULTURAL ADVICE, CAN BE HAD IN EXCHANGE FOR ONE POSTAGE STAMP.

*All Orders above 2l. will be delivered Carriage Free to any Station on the Great Western, Bristol, and Exeter, or South Devon Railways, or to Cork, Dublin, or Belfast.*

Apply to WILLIAM E. RENDLE, Union Road, Plymouth, adjoining the Terminus of the South Devon Railway.

THE AMERICAN NURSERY, BAGSHOT, SURREY.

JOHN WATERER begs to announce that he has just published a new CATALOGUE of Hardy Rhododendrons, Azaleas, Roses, Conifers, &c., and which may be obtained by enclosing two postage stamps.

*** The Colours of all the Rhododendrons worthy of cultivation are described; thus purchasers are afforded every facility in making selections.

HOSEA WATERER'S Descriptive Catalogue of AMERICAN PLANTS, CONIFERS, ROSES, &c., for the ensuing Autumn, is just published, and may be had on application, enclosing two postage stamps, to Mr. HOSEA WATERER, Knap Hill Nursery, Woking, Surrey.

BASS AND BROWN'S AUTUMN CATALOGUE is now ready, containing—

PART I. The New Geraniums, Fuchsias, Petunias, Verbenas, and other new and select Plants, at reduced prices.

PART II. Roses, select Evergreen and Flowering Shrubs, Climbers, Hardy Herbaceous Plants, &c.

PART III. Flower Roots, embracing splendid collections of Ranunculi, Gladioli, Early and Late Tulips, Iris, Lilies, imported Dutch Hyacinths, &c., &c.

Copies supplied on application, published complete with the newspaper stamp, to go free.

Seed and Horticultural Establishment, Sudbury, Suffolk.

A. PAUL AND SON'S CATALOGUE of ROSES for the present season, containing all the fine new sorts, may be had on application, enclosing two stamps for the postage.

Nurseries, Cheshunt, Herts.—Sept. 27.

GOLIATH STRAWBERRY.—A Post-office order for 5*s*. will secure (package free) 100 strong plants of this celebrated Strawberry, or 12 plants, free by post, on receipt of 18 postage stamps. Also TROLLOP'S VICTORIA, 4*l*. per 100, and any of the old varieties at very low prices. The usual allowance to the trade.—JAS. KITLEY, Lycombe Vale Nursery, Bath.

WHOMES' Descriptive Catalogue of his NEW PELARGONIUMS may be had on application.

Royal Pelargonium Nursery, Windsor, Sept. 27.

EARLY CABBAGE.—Stout Bedded Plants of superior true sorts, 4*s*. 6*d* per 1000, package included, delivered free of carriage to the Edenbridge station of the South-Eastern Railway.—Address, JOHN CATTELL, Westerham, Kent. Cash or stamps must accompany orders from unknown correspondents.

HYACINTHS, TULIPS, CROCUS, NARCISSUS, &c.

JAMES CHARTRES, SEEDSMAN, &c., 74, King William-street, City, London, begs most respectfully to inform ladies and gentlemen about to purchase their annual supply of the above, that he has a splendid collection, all selected bulbs, which he can strongly recommend. Orders above 1*l*. forwarded, carriage paid, to any part of the kingdom.

A Catalogue may be had on application.

JOHN B. SMITH begs respectfully to inform the Gentry and the Trade that his AMERICAN STOCK is very fine this season, and prices very low. A large and choice assortment of Azalea indica, from 18*s*. to 30*s*. per dozen, and upwards, good strong plants; Camellias, from 21*s*. to 30*s*., and upwards; Tea Roses, 9*s*. to 15*s*. per dozen; yellow Rhododendrons, strong plants, 7*s*. 6*d*. each, of the finest sorts; a fine collection of new hardy Rhododendrons, Lilies, &c.

RHODODENDRON PONTICUM AUREUM, bushy nice plants, 4 years from seed; these Rhododendrons are of vigourous habit, very hardy, and late flowering, having been raised from a fine variety of the Pontic class, carefully fertilised with their best new yellow varieties, several having flowered last season, proves them to be a valuable cross; they were quite novel and beautiful, large and distinct, and much admired, having a strong resemblance to the spotting, tints, and texture of the incomparable yellow class; from 3*s*. 6*d*. and 5*s*. to 7*s*. 6*d*. each. Also good plants of Dr. Hooker's collection of Sikkim Rhododendrons, in 3-inch pots, some of the sorts 4 to 6 inches high, from 3*s*. 6*d*. and 5*s*. to 7*s*. 6*d*. and 10*s*. 6*d*. each. Catalogues may be had by enclosing a postage stamp.

Norbiton Nursery, Kingston, Surrey, Sept. 29.

This Advertisement will not appear again.

CARNATIONS, PICOTEES, PINKS, PANSIES, HOLLYHOCKS, &c.

CHARLES TURNER'S extensive and carefully selected collections of the above are in the most robust health this season. Strong plants are now ready for sending out, including several new varieties that have established themselves as first-class flowers at the principal exhibitions.

| | |
|---|---|
| CARNATIONS, 24*s*. and 30*s*. per dozen pairs. | |
| PICOTEES, | do. do. |
| PINKS, 12*s*., 18*s*., and 24*s*. | do. |
| PANSIES, 12*s*, 18*s*., and 24*s*., per dozen. | |
| HOLLYHOCKS, 20*s*. and 30*s*. | do. |

The selection to be left to C. TURNER.

It should be stated if they are required for exhibition or other purposes, accompanied with a list of the sorts already grown, when a judicious selection may be depended on. A Descriptive Catalogue will shortly be ready.—Royal Nursery, Slough.

J. WEEKS & CO., King's Road Nursery, Chelsea, beg to inform the nobility and gentry that their DUTCH BULBS have arrived in excellent condition, which they can offer at very low prices. They can also supply their new HYBRID PEA at 1*s* 6*d*. per packet. A fine collection of Stove and Greenhouse Plants, Ferns, Seeds, Grape Vines for fruiting in pots, &c., &c. Catalogues forwarded on application.

PELARGONIUMS.—Now ready, 12 of the following for 42*s*., Carriage Free to London:—

Alderman, Alonzo, Constance, Christabel, Cuyp, Emily, Exactum, Florabunda, Gipsy Bride, Goliah, Knight of Avenal, Loveliness, Magnificent, Melissa, Narcissus, Old Story, Pride of the Isles, Prince Arthur (Pontey), Prince of Orange, Rosalind, Rowena, and Virgin Queen.

C. TURNER'S Descriptive Catalogue is now ready, including those fine new Seedling Pelargoniums raised by E. Foster, Esq., and G. W. Hoyle, Esq.—Royal Nursery, Slough, near Windsor.

RENDLE'S LIST OF NEW GERANIUMS will be found in the columns of this Paper, page 578, in the Number for September 13, 1851.

WILLIAM E. RENDLE, Florist to her Majesty, Plymouth.

NEW PLANTS AT REDUCED PRICES.

HENRY WALTON, Florist, &c., Edge End, Marsden, near Burnley, Lancashire, begs to state that his Autumn Catalogue of Geraniums, Fuchsias, Verbenas, Petunias, Cinerarias, Hollyhocks, Carnations, Picotees, and Pansies is now ready, and may be had for one stamp.

H. W. is also prepared to send out strong plants of the yet unequalled dark Pansy, "Jenning's King," 5s. 6d. each, or four to the trade 15s., for description of which see Catalogues.

N.B. Parties requiring Plants to furnish new Greenhouses, &c., will be reasonably dealt with.

NEW GERANIUMS, &c., AT REDUCED PRICES, NOW SENDING OUT.

BASS AND BROWN have a large, healthy, and vigorous Stock of the following in 4-inch pots, now ready for immediate re-potting, which will make fine specimen plants for exhibition.

The Nurseries, Great Berkhampstead, Herts.

NEW FANCY PELARGONIUMS.

W. AMBROSE begs to recommend the following new and first-rate FANCY PELARGONIUMS, many of which have received Certificates at the June and other exhibitions during the season, and will be ready to send out in good strong plants the second week in October:—

CAPTIVATION.—A fine dark maroon flower, of good habit, large, and very smooth. A fine bold attractive flower. Two First Class Certificates. 1*l.* 1*s.*

SUPERBA.—A well formed flower; dark crimson upper petals, margined with pink; lower petals blush, with dark markings of fine substance, and very smooth, equal in shape to any show flower. Two First Class Certificates. 1*l.* 1*s.*

PERPETUA.—A novel and handsome flower; upper petals deep purple, with crimson blotch, and light margin; lower petals blush, with distinct and constant spot of purple crimson; very dwarf, and a profuse bloomer. Second Prize. 1*l.* 1*s.*

RICHARD COBDEN.—A fine formed flower, of good habit; rich dark velvet upper petals, with clear white margin; lower petals rich crimson, large white centre; an abundant bloomer. Second Prize, and two First Class Certificates. 1*l.* 1*s.*

ERUBESCENS.—Upper petals deep rose, with light edging; lower petals blush and blotched; a compact grower and profuse bloomer. A good show flower. 10*s.* 6*d.*

TRIUMPHANT.—A beautiful high coloured flower, nearly approaching to scarlet, with a clear white throat. It received a Prize at the Seedling Exhibition at Regent's Park, in June last, for being the highest coloured flower in cultivation. 10*s.* 6*d.*

FASCINATION.—Upper petals rose-colour, with white margin; lower petals white, with rose markings. A large compact truss, and excellent bloomer. 10*s.* 6*d.*

MISS WRIGHT.—Crimson upper petals, with white margin; lower petals white, with deep rose markings; white centre. A good showy flower, and free bloomer. 7*s.* 6*d.*

SULTAN.—Upper petals deep crimson, with white margin; lower petals blush, marked with crimson. Good form. 5*s.*

NEPAULESE PRINCE.—Upper petals violet crimson, with rose margin; lower petals light, with dark markings. A very striking flower, moderate form. 5*s.*

JOHN BULL.—Upper petals mulberry; lower petals nearly the same colour. A most abundant bloomer, forming a head similar to an Hydrangea. 5*s.*

GRANDIS.—A fine dark maroon flower, very large and free. 5*s.*

W. A. having a few packets of choice Seeds of the Fancy Pelargoniums, begs to offer the same at 2*s.* 6*d.* per packet of 40 Seeds.—Nursery, King-street, Battersea, near London.

NEW ROSES.

WILLIAM WOOD AND SON have the pleasure of announcing that their DESCRIPTIVE CATALOGUE OF ROSES is now ready, and will be forwarded to all who have patronised them, and post free to all applicants. Such extensive addition has been made to their Stock, that they are able to execute orders of any magnitude with good Plants and without substitutions.

The above can be obtained in London of Messrs. NIXON, 123, Great Portland-street, Oxford-street; of Messrs. HURST and M'MULLEN, 6, Leadenhall-street; and of Mr. CARTER, 238, High Holborn. And at the Nursery the following: a Catalogue of Ornamental Trees and Shrubs, including a fine collection of Coniferæ and choice Herbaceous Plants; and a Descriptive Catalogue of New and Select Fruits. The Trade Catalogue is also now ready.

Woodlands Nursery, Maresfield, Uckfield, Sussex.

SANGSTER'S NEW EARLY No. 1 PEA.

HAY, SANGSTER, AND CO., in submitting the above valuable PEA to the public, can recommend it with the greatest confidence, as the largest podded and best Early Pea known, and of first-rate quality; height, 2 feet. Price 2*s.* 6*d.* per quart.

York Regent Potatoes, from prepared cuttings, 6*s.* per bush. Cambridge Radical do. (a first-rate second early) 6*s.* do. Early Oxford do., 10*s.* 6*d.* do. Early Ebrington Kidney do., 10*s.* 6*d.* do. Early Ash-leaf Kidney do., 10*s.* 6*d.* do.

Post-office orders to be made payable at the Borough Post-office to HAY, SANGSTER, and Co., Nursery and Seedsmen, Newington Butts, London. One-bushel hampers and booking, 1*s.* 6*d.*; two-bushel, 2*s.* 6*d.* Sacks, 2*s.* 6*d.* each.

DUTCH HYACINTHS, per doz., 6*s.* to 12*s.*
Or an assortment of three dozen, best sorts, for 16*s.* 6*d.*

| | | |
|---|---|---|
| Double Roman Narcissus ... ... ... | per doz. | 3 0 |
| Double and Single Van Thol Tulips ... | ,, | 1 0 |

ROBERT HALL, 63, South Audley-street, Grosvenor-square.

FIRST CLASS GERANIUMS.—TWO GUINEA SET.

WILLIAM E. RENDLE, Plymouth, Florist to her Majesty, will supply Twelve of the following first-rate GERANIUMS for 2*l.* 2*s.*, with a plant of Elliott's Surprise over.

RUNDLE'S BEAUTY OF MONTPELLIER; May Queen (Hoyle); Nectar Cup (Hoyle); Ajax (Hoyle); Rubiola (Hoyle); Isis (Hoyle); Flavia (Hoyle); Generalissimo (Hoyle); Gaiety (Foster); Corinne (Hoyle); General Jung Bahadour (Gaines); Lady Peel (Paley's, first time sending out); Candidate; Boule de feu; Village Maid; Cardinal (Hoyle); and Heartsease.

*Descriptions of* ELLIOT'S SURPRISE, *and* RUNDLE'S BEAUTY OF MONTPELLIER, *will be found in the* Gardeners' Chronicle, *Sept.* 13*th, page* 578.

| | s. | d. |
|---|---|---|
| Twelve excellent GERANIUMS ... ... ... | 12 | 0 |
| Twelve excellent Fancy do. ... ... ... | 20 | 0 |
| Twelve excellent Scarlet do. ... ... ... | 15 | 0 |
| Twelve excellent CINERARIAS ... ... ... | 10 | 0 |

*For names of the varieties, see page* 578, *Sept.* 13.

*All Orders above* 2*l. will be delivered Carriage Free to any Station on the Great Western, Bristol and Exeter, or South Devon Railway, or to Cork, Dublin, or Belfast. All Orders attended to in strict rotation.*

*A large Collection of BULBS has just arrived from Holland, which will be offered at very reduced prices.—Catalogues on application.*

Apply to WILLIAM E. RENDLE, Union Road, Plymouth, adjoining the Terminus of the South Devon Railway.

G. JACKMAN, Nurseryman, Woking, Surrey (1¼ mile from Woking Station, South Western Railway), begs to announce that he has published a new and complete Catalogue of his American Plants, Ornamental Evergreens, Conifers, Flowering Shrubs, Standard and Dwarf Roses, Fruit and Forest Trees, &c., &c., and may be had on application by enclosing two postage stamps.—Woking Nursery, Sept. 27.

VICTORIA REGIA.

J. WEEKS AND Co., King's-road, Chelsea, have great pleasure in announcing the complete success of this magnificent Aquatic, the Queen of the Lakes, GROWING IN THE OPEN AIR. The splendid flowers are now open every day, to the great admiration of all who see it. A few fine YOUNG PLANTS ARE NOW FOR SALE. Full instructions for its cultivation will be forwarded on application to J. WEEKS and Co., King's-road, Chelsea.

DUTCH BULBS! WHAT CLARKE AND CO. GIVE FOR 10*s.*—The Undersigned, having Imported a very choice assortment of Dutch and other Bulbs, embrace the opportunity of submitting to the notice of the Public in general the following collection at the above price for Flowering in the winter and early spring. Half a dozen best Hyacinths for Glasses (various), half a dozen good Hyacinths for pots, 50 Crocuses, four separate colours, 50 Double Snowdrops, half a dozen Double Van Thol Tulips, half a dozen Early Van Thol Tulips, 1 dozen Double White Sweet-scented Narcissus, half a dozen Double Jonquils, 1 dozen Winter Aconites, 25 splendid Mixed Tulips, 1 dozen beautiful Mixed Double Anemones.

CLARKE and Co., Seedsmen, &c., 86, High-street, Borough, about 30 doors from London-bridge Railway Terminus.

*** The cash will be returned if the bulbs are not approved of.

PERMANENT PASTURE.

HENRY ROGER SMITHE, of Eastling, Faversham, Kent, informs the public that his mixtures of the NATURAL GRASSES and small CLOVERS, gathered under his own superintendence, including every sort necessary to form a Permanent Pasture, on various soils, are now ready; delivered on the South-Eastern Railway, at 1*l.* per acre, allowing three bushels per acre. Also Seeds for Lawns, and for renovating old pastures; the nature of the soil to be sown should be particularly stated. Instructions for sowing will be sent with each parcel. Seeds are this year comparatively scarce; the Advertiser has, however, determined not to raise his prices, considering the ruinous effects of free trade on Agriculture, and depending on the extension of his business for a return of his outlay.

THE ROYAL EXHIBITION.

FLOWER-POTS! FLOWER-POTS!! FLOWER-POTS!!!

CHARLES PHILLIPS, Potter, of Weston-Super-Mare, having been requested by the principal Nurserymen of England to publish a complete LIST of the clear inside diameter of all Pots manufactured by him, begs leave to subjoin the following:—

| No. | Size. | No. | Size. | No. | Size. | No. | Size. |
|---|---|---|---|---|---|---|---|
| 1 | 1½ in. | 6 | 4½ in. | 11 | 8¾ in. | 16 | 15 in. |
| 2 | 2¼ ,, | 7 | 5¼ ,, | 12 | 9¼ ,, | 17 | 16 ,, |
| 3 | 2¾ ,, | 8 | 6¼ ,, | 13 | 11 ,, | 18 | 18 ,, |
| 4 | 3¼ ,, | 9 | 7 ,, | 14 | 12¼ ,, | 19 | 20 ,, |
| 5 | 4 ,, | 10 | 8 ,, | 15 | 14 ,, | 20 | 22 ,, |

Saucers and Seed Basins the same width as the Pots.

Persons visiting the Royal Exhibition can inspect CHARLES PHILLIPS'S Pottery, &c., in the Model Greenhouse, situate at the West Entrance of the Crystal Palace. C. P. deems it superfluous to laud either the quality of his Clay, or the style in which his goods are manufactured, but confidently refers those parties who have not yet patronised him to the Royal Gardens at Frogmore and Kew, and to the principal Nurserymen in London, Slough, Reading, Oxford, Swindon, Cirencester, Stroud, Worcester, Gloucester, Cheltenham, Bath, Bristol, Taunton, Tiverton, Exeter, Torquay, Totnes, Plymouth, North and South Wales, &c., &c., for the quality of the articles which he has had the honour of supplying them with. All orders for the above Goods will be promptly forwarded, CARRIAGE FREE, to any Railway Station within 150 miles of the Manufactory, either in dozens, casts, hundreds, or thousands. Every description of Red Ware, Sewerage, Piping, Closet-Pans, Chimney-Pots, Land Drain Pipes, Seakale Pots, Vases, Tiles, Bricks, &c.

Lists of Prices, Terms, &c., forwarded to any address.

Manufactory, Locking Road, Weston-Super-Mare, Somerset.

ESTABLISHED 1836.

MILDEW.

EPPS'S SULPHURATOR may be had of all Nurserymen, Seedsmen, and Ironmongers, price 21*s.*, and upwards. The Trade supplied by Barber and Groome, Holborn, London.

This Machine has been used by the following persons, and the highest testimonials have been received as to its valuable properties, in effectually destroying the Mildew on Grapes, Peaches, Peas, and all other horticultural produce:—Dr. Plomley, F.R.S.; Mr. Ingram, gardener to her Majesty at Windsor; Mr. Smith, Superintendent at the Royal Gardens, Kew; Mr. Iveson, Sion House; Mr. Glendinning, Chiswick; Mr. Thompson, Horticultural Society's Gardens; Mr. W. P. Ayres, Blackheath; Mr. Gaines, Battersea; Mr. Cole, gardener to — Colyer, Esq., Blackheath; Mr. Robson, gardener to Earl Cornwallis, Linton Park; and many other scientific and practical men.—High-street, Maidstone, Sept. 27.

GREEN AND HOTHOUSE BUILDER.—Green and Hothouses made by Machinery, sent to all parts of the United Kingdom. These Horticultural Buildings are warranted to be made of the best materials, and the cheapest in England. Lists of prices post free. 1½ in. greenhouse lights, 2½*d.*; 1¾ in. ditto, 3*d.*; 2 in. ditto, 3½*d.* per foot; if glazed with 16 oz. sheet-glass of a large size, 4*d.* per foot extra.

J. LEWIS, Horticultural Works, Stamford-hill, Middlesex.

*Carriage free to any Railway Station in the United Kingdom, on orders of 5l. and upwards.*

ROYAL NURSERY.

THE SUBSCRIBERS have much pleasure in announcing that their stock of the under-mentioned is this season unusually strong and healthy, and are now ready for sending out at the following prices :—

ARAUCARIA IMBRICATA, 1 ft., 20s. per doz.
" " 2 ft., 42s. do.
" fine specimens, 3 ft., 21s. each.
CEDRUS DEODARA, 1½ to 2 ft., stout and fine, 24s. per doz.
" " 2½ to 3 ft., " " 42s. do.
20 species of the most ornamental, rare, and hardy CONIFERS for 5l.

CAMELLIAS of all the best kinds, well set with flower-buds, 30s per doz.
" " without buds, 24s. per doz.
ERICAS and EPACRIS, best sorts for autumn and winter flowering, 12s. per doz.
CHRYSANTHEMUMS, newest and best kinds, fine bushy plants, in 5-inch pots, for blooming this season, 12s. per doz.
" Lilliputian varieties of 1849, 1850, and 1851, 9s., 12s., and 18s. per doz.

CARNATIONS, PICOTEES, AND PINKS.

| | | | |
|---|---|---|---|
| 25 pairs of finest first-rate show varieties of Carnations and Picotees | | | £5 0s. |
| 12 pairs | do. | do. | 2 10 |

Foreign ones carefully packed to ensure safe transmission.
YOUELL and Co., Royal Nursery, Great Yarmouth.

**The Gardeners' Chronicle.**

*SATURDAY, SEPTEMBER 27, 1851.*

MEETING FOR THE ENSUING WEEK.

COUNTRY SHOW.—Tuesday, Sept. 30: Slough Dahlia.

WE should hope that POTATO GROWERS are by this time satisfied of two things—that there is no security whatever against disease, and that the best remedy when the disease arrives is to pull up the haulm.

It seems probable that the loss in the present season will not be less in proportion in the south of England than in 1845 and 1846, although the season has been as dry, and at the same time cool as it is ever likely to be in this country. Since the beginning of August we have had a succession of the finest harvest weather, interrupted by one or two heavy showers only; and yet, now that Potatoes planted with the utmost care are lifted, there are many hills in which there is not more than one or two sound tubers, although the ground is filled with the produce. In common field land, or in heavy clay, or in furrows of decayed leaves, whether set in autumn or in early spring, it is much the same; the destruction is enormous. Luckily we no longer rely upon the Potato as we once did.

Among those which we have had the opportunity of examining, there is, as usual, much difference in the amount of disease in different sorts. One of the worst is a kind called the Chinese, planted in leaf-mould on thoroughly drained land, in January last; of this three in four are rotten. One of the best is the "Russian," planted at the same time, in the same manner, not more than one-fourth being bad *at present*. The best of all is a sort received from Mr. CUTHILL in October, 1850, with the following note:—"Nos. 1 and 2 are the same sort; a late Yorkshire Kidney, very mealy and prolific. On No. 1 the haulm was allowed to grow until ripe. No. 2, haulm cut down July 27th; the two bags are the produce of ten plants. No. 1 weighed 12½ lbs.; No. 2 weighed 10 lbs., being a loss of 2½ lbs. by the removal of the haulm. No. 2 is not near so mealy, nor yet so good in flavour as No. 1. The object in removing the haulm off every alternate root, which I did, was to allow the air free circulation amongst the Potatoes which had the haulm on, thereby giving a better chance of escaping the disease."

It is very remarkable that of these two samples planted side by side on the 7th of October, 1850, No. 1, on which the diseased haulm had been left, was a good deal diseased, while No. 2, from which the haulm had been removed, was almost wholly sound. This looks as if the seeds of the disease had been communicated to No. 1 by the haulm, and then to its produce, when the time came.

We would also observe that the very ground in which all this disease has now shown itself, to the destruction of most of the crop, was also attacked in 1850, but yielded a lot of good sound Potatoes. There was this difference however between the two years, that in 1850 the haulm was pulled up as soon as the disease appeared, while in 1851 the haulm was allowed to remain undisturbed, for the express purpose of seeing the result. We can therefore draw no other conclusion than that the removal of the haulm gives the only real chance of stopping the Potato disease, and that it is better to sacrifice a part of the crop, if necessary, by destroying the stems and leaves, than by preserving them to obtain a large bulk of diseased and worthless produce.

UNDER the present favourable aspect of the manufacture of Flax, and the bright hopes which have been excited by the important discoveries that have lately been made in every stage of its preparation, from the green stalk to the beautiful silky or cotton-like fibre ready for the wheel, everything connected with the growth of the plant assumes a degree of consequence which it did not possess before. A few black spots upon the stems, and capable of resisting the ordinary mode of maceration, which, under other circumstances, might have escaped notice, command at once our attentive examination.

Just before the commencement of summer last year, the Flax stems in the neighbourhood of Cobham were observed by Miss MOLESWORTH to be infested by fungoid spots, which were at first of a dark red brown inclining in parts to orange, and in age acquiring so dark a shade as to appear black. Much attention does not seem to have been paid to them then, but when during the present year the Flax underwent the operation of steeping, the stems, though the external layers of cells had perished, came out still covered with dark swollen patches, which peeled off, together with the Flax fibres,

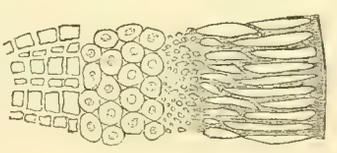

Fig. 1.

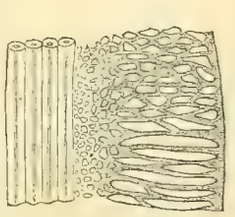

Fig. 2.

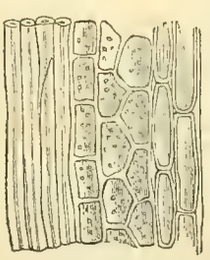

Fig. 3.

after the woody portion was separated. The production, on being submitted to us by Prof. HENSLOW for determination, proved to be one of those anomalous bodies which are referred by authors to *Sclerotium*, and which are, in fact, mere states of certain fungi which have not gone through their normal stages of development. The present is undoubtedly what FRIES calls *Sclerotium herbarum*, and is referable to that form which is described by EHRENBERG as *Xyloma Lini*. This and other similar productions are, we doubt not, mere conditions of several species of *Uredo;* and the present, if fully developed, would probably prove *Uredo Lini*.

The question, however, of interest at present, is, how does it affect the fibres, which are the valuable part of the Flax plant? The process of steeping is intended not only to separate these from the wood, but also to destroy the parenchym, which, if present, would prevent the effective heckling of the Flax. The impression at first would be, from the appearance of the stems when taken from the steeping pool, that the fibres would be most seriously affected. This, however, does not seem to be the case, except to a comparatively small degree. A section made through the spots when the plant is fresh exhibits a total derangement of structure in the layers of cells external to the Flax fibres. In the plant these consist of several layers of short horizontal cells, varying according to their position in the degree of constriction of the articulations, and containing chlorophyl, or a mass of colourless matter. In the dark spots, however, the cells are, for the most part, vertical; those in the centre of the mass being greatly elongated, while towards the thin edges they are shorter and more numerous, but still vertical; both rest upon a delicate minutely divided cellular stratum, which forms a sort of stroma. There is not a trace of the original structure, and the Flax cells upon which they rest are only so far affected that the walls of their narrow cavity are tinged with brown, and minutely granular. Therefore, though the spots, by reason of their compact structure, and the induration of the walls of the cells, in consequence, probably, of some chemical change which has taken place in their constituent parts, resist completely the operation of steeping; and though they are firmly attached to the Flax fibres, yet, not being intimately connected with them, or imparting to any serious extent their peculiar quality, the Flax separates perfectly from them when heckled, and there is merely left a yellowish tinge on the threads, as far as the spots extended; and though this change of colour does arise from the diseased tissues seated above them, the tenacity does not seem to be less in those parts than in the others, nor does the thickness of the fibres suffer there any change. Occasionally, but rarely, instead of a yellow spot being left after the diseased tissues have been removed, the spot is white, which probably would indicate some more serious derangement, if not the death of the blanched portions. We have not, however, had sufficient materials before us to come to any safe conclusion on the matter. We have represented in our figures transverse and longitudinal vertical sections (Figs. 1 and 2) of the spots *in situ*, showing that they are quite distinct from the Flax cells, together with a longitudinal section of the tissues external to the wood in the healthy plant (Fig. 3).

*M. J. B.*

## ORCHIDS FOR THE MILLION.—No. XVII.

By B. S. WILLIAMS, gr. to C. B. WARNER, Esq., Hoddesdon.

CLIMATE HOT AND DAMP.—PLANTS GROWN IN BASKETS, WITH MOSS.

*Maxillaria tenuifolia*, from Mexico, flowers in April and May. It succeeds best in a basket with moss, suspended from the roof of the house, where plenty of heat and moisture can be maintained during the growing season; it lasts in perfection three or four weeks.

*Stanhopea insignis.*—This fine Brazilian Orchid flowers in June and July. It will thrive in a basket with moss and small potsherds. When not growing it should be kept cool; it remains only a short time in flower.

*Stanhopea tigrina.*—This handsome species, which comes from Mexico, flowers from July to September; the blossoms are very large, pale yellow, barred and blotched with dull purplish brown. It does best in a basket in moss and small potsherds; it lasts but a short time in perfection.

*Stanhopea grandiflora*, comes from Trinidad. It flowers at different times of the year. The blossoms are white, and very large. It likes a good supply of heat and moisture while growing; afterwards it should be put at the coolest end of the house, and should be kept rather dry.

*Stanhopea Devoniana*, flowers from July to September. Like the preceding, it should be grown in a basket with moss, and it requires similar treatment. The flowers remain three days in perfection.

*Stanhopea oculata*, comes from Mexico, and flowers from July to September. The blossoms remain in beauty three days.

*Stanhopea Wardii*, from La Guayra; flowers from June to August; it remains but two or three days in perfection.

*Stanhopea tigrina lutescens.*—This is a fine variety from Guatemala; the flowers are brilliant yellow, inclining to orange, and are larger and handsomer than those of any other kind. It requires the same treatment as the former. The flowers last in perfection three days.

*Saccolabium guttatum.*—This, which is one of the most beautiful of Orchids, comes from the hotter parts of India. It blossoms from May to August. The flowers are white, spotted with deep rosy purple. It likes plenty of heat, light, and moisture, during the growing season. When it is at rest it should have but little water. It remains three or four weeks in bloom.

*Saccolabium Blumei*, a charming species, from Java; blossoms from May to August. The flowers, which are nearly the same colour as those of the former, last a long time in beauty. It requires plenty of heat, light, and moisture, particularly during the growing season. It need not have much rest.

*Aerides crispum* is a beautiful Indian species, which flowers in May, June, and July; the blossoms are white, and tipped with pink. It should have a good supply of heat and moisture while growing; it will remain three weeks in bloom, if the flowers, which are deliciously fragrant, are kept dry.

*Aerides odoratum*, from India, flowers from May to August; the blossoms are white, stained with pink, and are very fragrant. They will remain three weeks in bloom. It requires plenty of heat and moisture while in an active growing state.

*Aerides affine*, flowers from May to July; the blossoms are pink and purple, and they remain three or four weeks in perfection. It only requires a short season of rest.

*Aerides maculosum*, comes from Bombay; it is a most

beautiful species, which flowers in June and July. It likes plenty of heat, light, and moisture during the growing season; and it requires but little rest. Its flowers remain long in perfection, if they are kept dry.

*Aerides roseum*, flowers in June and July; and, like other Indian kinds, it requires plenty of heat and moisture while making growth. The blooms remain three weeks in beauty.

*Aerides virens*, flowers in June and July, and the blossoms remain long in perfection.

*Vanda cristata*.—This fine Indian Orchid flowers from March to June. It must have plenty of heat during the growing season; afterwards it should be kept drier. It will keep in flower for six weeks.

*Vanda suavis*, comes from Java. It will succeed on a block, but it does best in a basket. It likes plenty of heat and moisture during the growing season. When in bloom it is one of the most beautiful of the genus.

*Vanda tricolor*, from the same country, is also a fine species. It flowers from May to July, and requires plenty of heat and moisture while growing.

All the above will thrive on blocks, but I am of opinion that they grow best in baskets filled with moss and potsherds, and suspended from the roof.

## BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

SECTION D. *Tuesday, July 8.* (*Continued from p. 596.*)—*Notes on the Botanical Geography of part of the Himalaya and Tibet;* by Major E. MADDEN and Captain R. STRACHEY.—This paper was illustrated by a sectional drawing of the Himalaya mountains, from the plains of India to Tibet, passing through the British province of Kumáon, on which the names of the more striking plants were inserted at the elevations where they were found. The section commencing from the southern face of the mountains first represented the band of forest that skirts their foot, chiefly composed of the trees of tropical India. Ascending, we find forms of temperate climates gradually introduced above 3000 feet. Pinus, Rosa, Rubus, Oak, Berberis, Primula, &c. At 5000 feet the arboreous vegetation of the plains is altogether superseded by such trees as Oaks, Rhododendron, Andromeda, Cypress, and Pine. The first ridge crossed, ascends to a height of 8700 feet in a distance of not more than 10 or 12 miles from the termination of the plains. The European character of the vegetation is here thoroughly established, and although specific identities are comparatively rare, the representative forms are most abundant. On a part of this ridge is found a Palm that on some mountains, not far off, attains a height of 50 feet at an elevation of more than 8000 feet above the sea, where it is every year covered with snow. Passing onwards we enter a zone of less elevation which is comparatively devoid of wood, and is chiefly devoted to agriculture. The climate is not very dissimilar to that of northern India, but not nearly so hot, and many species of tropical plants occur. Crossing another ridge, similar in its vegetation to that first mentioned, we descend into the valley of the Sarjie, one of the rivers that penetrate at a very low level far into the interior, carrying with them a tropical vegetation into the heart of the mountains. This, however, is considerably modified by the height and by the greater humidity. We thus find Pines and Palms, Oaks and Maples, growing with the ordinary trees of the plains, and a similar confusion of the flora of the temperate and torrid zones holds with the shrubs and herbs. From this valley we pass into that of the Pindar, which we follow up from 7500 feet to its source in a glacier at 12,000 feet. From 7500 to 11,000 feet, the region of Alpine forest, the trees most common are Oaks, Horse-chesnut, Elm, Maples, Pines, Yew, Hazel growing to a large tree, and many others. They often grow to a very large size, and the forest is usually far finer than in the lower mountains. At about 11,500 feet the forest ends; Picea Webbiana and Betula Bhojpatra being usually the last trees. Shrubs, however, continue in abundance for about 1000 feet more, about 12,000 feet the vegetation becoming almost entirely herbaceous. On this southern face of the mountains the snow line is probably at about an elevation of 15,500 feet. The constant condensation of vapour on this face causing a very humid climate, the vegetation is very luxuriant, and the great riches of the Himalayan flora are found in this region. As we pass to the north of the great snowy peaks, we leave behind us this wet climate and enter a country that very soon becomes equally remarkable for its extreme aridity. In the valley of the Gori, into which we next pass at an elevation of 11,500 feet, we find that several Tibetan plants have appeared, the flora, however, having become very poor. The gorges that lead to the great passes into Tibet are almost devoid of vegetation. The highest dicotyledonous plant noticed on this route was at about 17,500 feet, probably a species of Echinospermum; an Urtica also is common at these heights. The snow line here recedes to 18,500 or 19,000 feet. In Tibet itself, the vegetation is scanty in the extreme, consisting chiefly of Caragana, Artemisiæ, Astragali, a few Gramineæ, Potentillæ, &c. The plain to the north of the Himalaya is almost a desert, not more than one-twentieth of the surface being clothed with vegetation, and that of the most miserable sort, the bushes seldom rising above a foot in height. The cultivation of Barley extends to a height of 14,000 feet. Vegetation ends at about 17,500 feet, the highest plants being Corydalis, Cruciferæ, Nepeta, Sedum, and some few others.

*On the Botanical Geography of Western Tibet*, by Dr. T. THOMSON.—A section of this country, similar to that which accompanied Capt. Strachey's paper, was also exhibited. It extended on a line nearly north and south from the upper part of the Chenab river to the Kára Korum pass on the Konenlun chain of Humboldt. The chain to the south of the Chenab, rising to an elevation of 15,000 feet, excludes a considerable quantity of humidity from the valley of that river, and the vegetation, though not altogether losing its truly Himalayan character, becomes much modified. Thus the Oaks, Rhododendrons, and Andromeda, so common on the southern mountains, are not found; while fruit trees become more abundant, and the Grape-vine ripens its fruit admirably. Passing to the north the next ridge that is crossed reaches a height of from 20,000 to 22,000 feet, the passes being usually upwards of 18,000 feet in elevation. To the north of this range the climate and vegetation suddenly change, and the Tibetan types are at once established. The general character of the flora is Europeo-Siberian, but much modified by the extreme aridity which almost excludes trees and shrubs; it hardly exceeds 500 or 600 species in all. The chief groups are Borragineæ, Chenopodiaceæ, Cruciferæ, Astragalinæ Leguminosæ, and Artemisioid Compositæ. The few trees consist of a Poplar, confined to the more sheltered ravines, and an occasional Juniper on the hill sides. The more common shrubs are Lonicera, Tamarix, Myricaria, and Hippophaë. The high Alpine herbaceous flora is almost strictly Siberian, and is a little more varied and copious than in other parts of this region, from the additional moisture derived from the melting of the snow. It extends sometimes even to a height of 18,500 feet.—Dr. J. Hooker observed that Captain Strachey and Dr. Thomson had done for the Himalaya what Humboldt had done for the Andes. The district of the Himalaya in which he had travelled was not unlike that just described—it was, however, higher, reaching to 28,000 feet, whilst that first described was only 25,000 feet. In the Sikkim Himalaya the ascents were constantly modified by descents, and there was more rain, and the line of perpetual snow was lower, than in Kumaon. Pines were alike abundant in both regions. The Larch was abundant in Sikkim, but absent in Kumaon. Rhododendrons numbered 36 species in Sikkim, but only six or eight in Kumaon.—Mr. Winterbottom, who had travelled over the same districts with Captain Strachey and Dr. Thomson, compared the flora of the Alps with that of the Himalaya, and pointed out the comparative richness of the latter. Where Firs alone grew on the Alps, a most varied and beautiful vegetation was observed in the Himalaya. There was, however, a great difference in different districts. Where the rains fell and the atmosphere was moist, there the vegetation was most prolific, but where there was a want of moisture the land was sterile and truly disagreeable to behold. Many of the plants were representative of European species.

## BRITISH SONG BIRDS.

(CAGE BIRDS, No. 31.)

No. XLVII.—We will now resume the thread of our discourse, on the subject of migratory instinct. We have spoken of the inherent power which birds of passage possess to travel long distances; and also of the unerring instinct that directs their flight, and teaches them where to go. This suggests a whole train of thoughts.

In the first place, we will consider what becomes of them immediately on their leaving our shores; and it will be reasonably asked,—how do these birds contrive to live so long as they do, on certain occasions, without food? This has, 'ere now, puzzled me, too, not a little. I resolved the matter by a close observation of the various migratory birds which I kept in confinement, which leads me to a curious part of my subject. These little creatures, when I commenced keeping them, exhibited at certain seasons of the year, and all on a sudden, a very ragged appearance. I observed that some of them had damaged tails; others, ruffled wings; and not a few of them presented a most haggard appearance I was at that time unable to account for this phenomenon; but knowing two gentlemen who were well versed in Natural History, and both of them devoted amateurs in the matter of the nightingale, I applied to them on the subject, and they at once cleared up the mystery.

It appeared that my birds (like their own, which I saw) were suffering from the "agitation," to which I have before had occasion so often to allude. This "agitation," or intense desire to quit the country, is felt by *all* migratory birds, free or otherwise; and if in confinement, they will dash about their cages nearly the whole night through; sometimes throughout the day also. The fever commences in September, and lasts some weeks. This quite upsets the doctrine of those who affirm that young birds are guided in their movements and preparations for migration by the *old* birds. True to the instinct of his nature, every bird, however ignorant, would not be at all puzzled, if set free, to join his companions abroad. I may remark, that this "agitation," in a milder form, is again felt by cage birds in the spring,—the season for the *return* of our feathered friends. But we were going to speak of their being able to live so long without food.

When the season of "agitation" or migration arrives, immediately behind the lower extremity of each bird there is formed a lump of fat. This I have found to continue, more or less, for a month. Whilst this remains, you will find your birds altogether destitute of appetite. Their food, however fresh, remains almost untouched. They sit uneasily and restless on their perches, and cannot be won, even by kindness, to take notice of anybody. From this I infer, that the said mysterious lump of fat in some way supports animal life; and it no doubt materially assists those birds, which, whilst making long passages, are unable to procure their usual food. Such was also the opinion of my two good friends. I may add, that covering your birds up is of little avail. Place them where you will,—do with them what you will,—their restless state of excitement *must* continue until Nature's laws are satisfied.* The visitation over, your birds will soon regain their lost spirits.

A few months since, I promised to speak in due course of the early education of birds, and to show how very much depends upon ourselves in rearing them properly, and making them first-rate songsters. I also promised to notice other peculiarities connected with their instinctive habits. It has been suggested to me, within the last few days, that no better time offers for the fulfilment of my promise than the present. Be it so.

I have on a number of occasions remarked, how very few there are amongst us that have not *some* feathered "pet" in their families. All such must have observed, when entering the shops where song birds are usually sold, the hideous noises uttered on every side by parrots, macaws, and the like monstrosities; these noises, I would again remark, are in many instances imitated by the smaller birds; and in *all* instances they do irreparable injury to *good* birds. This is why I have been so unceasing in giving my advice as to where people should *not* deal; and once more I emphatically say,—let all intending purchasers beware! If, after my repeated cautions, anybody *should be* "taken in," the fault will certainly never be chargeable upon *me*.

So remarkably tenacious is the memory, and so remarkable acute are the ears of some nestlings when only a day or two old, that instances are on record of the note of the parent bird having been heard, at this tender age, and *never afterwards forgotten by the callow offspring*. Knowing this, we have the key to a most important secret. It is many years since I was enlightened on the point; and I have had oft-repeated opportunities of witnessing extraordinary results from a careful study of the subject.

At Birmingham, in particular, is one branch of this secret extensively known; for we there find splendid linnets educated under the wood-lark, and singing the celestial notes of that bird of birds with perfect freedom. So "true," too, are they in their song, that you shall not distinguish by the ear one from the other. This is effected, entirely, by taking the linnets when only a day or two old, and feeding them in a room tenanted by wood-larks *only*. The titlark, I may remark, is an equally good tutor, but not so *recherché* in his music.

On the same principle, if an Englishman and his wife were residing in France, and had children born there—the latter would, naturally, speak the French language as glibly as the natives, if allowed to mix with them from their early infancy. They would, indeed, speak French *and* English—the one as well as the other. There is nothing wonderful in this; but it helps us to an argument, and enables us to reason. When we can do this, good-temperedly, we carry all before us.

I will merely add to the foregoing, that these notable facts, and many others, are not only very curious, but they demand our best attention. It is quite evident that in Nature herself we must seek her laws; it is only when we deviate from them that we encounter difficulties. In my researches after truth, I have employed the whole strength of my reason, "and though," to use the words of the good St. Pierre, "my means have been comparatively feeble, yet I can conscientiously assert that I never passed a single day without collecting SOME agreeable observation. When I commenced these treatises, I imagined I had amassed sufficient materials for a history of Nature; but alas! I was like the child who, with a shell, dug a hole in the sand to receive the waters of the ocean!" *William Kidd.*

## FRUIT ROOMS.

THE following description and plan of a fruit-room, belonging to Josiah Moorman, Esq., Clapham-road, with some remarks by Mr. Robert Thompson, was published in a recent number of the "Journal of the Horticultural Society."

"The supply of fruit in autumn is almost superabundant in favourable seasons, and in varieties there is then an ample choice. Many of these, however, are naturally of so short duration, that they cannot be long kept well under any circumstances. Means may be adopted for preventing their decomposition, but their flavour is frequently deteriorated or completely lost. In general, those kinds that ripen early soon decay; and a large proportion of the fruit cultivated by extensive growers is of this description, because it pays them better to take such at once to market than run the risk consequent on the keeping of later varieties. Hence we find that towards Christmas the quantity of fruit, of Pears more especially, is greatly diminished, and that the choice is reduced to comparatively few sorts. Such favourites as the Marie Louise and Beurré Bosc are not to be had under ordinary circumstances. In January the scarcity becomes greater, and Jersey Chaumontels make their appearance, imported at the high price of, not unfrequently, 5*l.* per hundred; whilst

* These curious facts, showing how completely the heart of all "birds of passage" is in a foreign land, at certain seasons, really *ought* to suggest the question,—"Are we justified in keeping them pent up in cages?"

well matured specimens of the Easter Beurré and Beurré Rance are in request, leaving the greener and less perfect of these, and a few of some other sorts, to make occasionally the appearance of supply during the spring months—quite inadequate, however, to meet anything like a regular demand, such as would certainly be made if Pears could be well kept in abundance till that period.

"The high state of perfection in which fine specimens of Pears have been frequently exhibited to the Society by Mr. Moorman at periods of the season much later than the varieties usually keep, rendered it very desirable to obtain an account of the method by which these were preserved in such admirable condition. On applying to Mr. Moorman he kindly afforded every information with regard to the mode by which his Pears are kept; and he also permitted Mr. Sibthorp, the superintendent of works at the Society's Garden, to make the accompanying drawings, which will give a correct idea of the place.

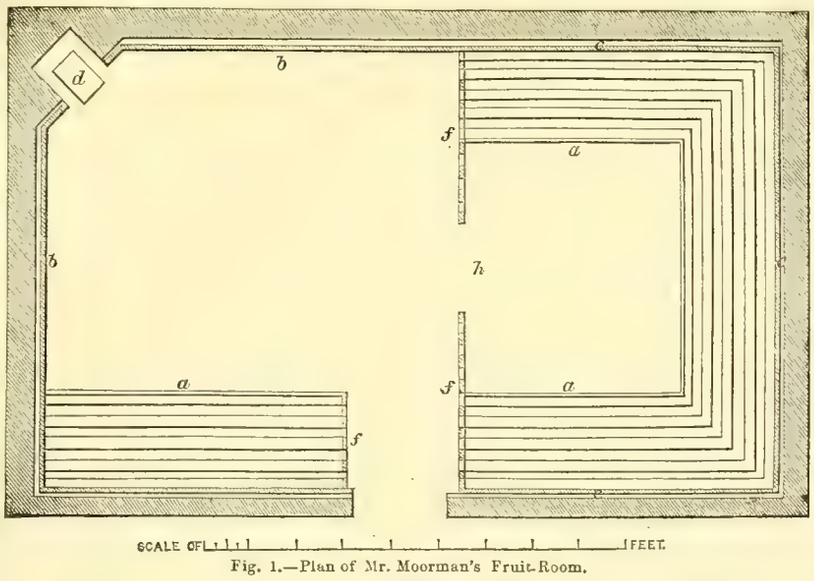

Fig. 1.—Plan of Mr. Moorman's Fruit-Room.

"The room was not originally constructed for a fruit-room; but, by a little adaptation, Mr. Moorman has succeeded in rendering it a most excellent one, as is proved by the prizes awarded for the productions exhibited from it—not in any one year, but repeatedly, year after year. It is a partitioned-off portion of a loft, which extends over a coach-house and stables, and is that part which is above the coach-house. It was originally fitted up for a harness-room, the walls, as is usual in such places, being lined with wood. The roof is slated. The range of building is detached, and faces the south-west.

"It will be observed that there is a cavity, *c*, between the boarding and walls. This, I believe, is an important circumstance, and so is the wooden lining, because air and wood are known to be slow conductors of heat. The ceiling on the north side is double, and the floor is wood above a ceiling. We may therefore conclude that a uniformity of temperature in the interior of the room is insured to a considerable extent.

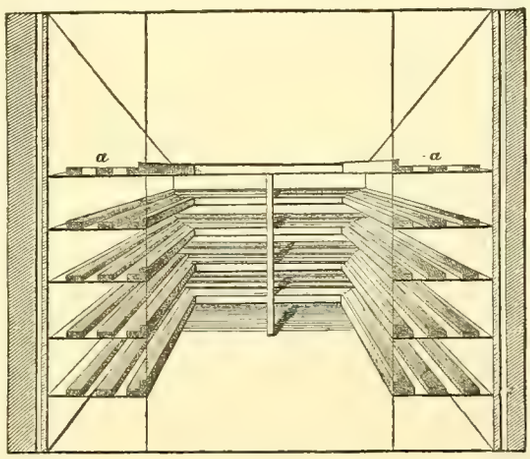

Fig. 2.—Interior View.

"There is the small stove, *d*, but it is seldom used, and never with the view of warming the air of the room, unless the temperature is actually below freezing. The fruit is therefore kept cool. The swing-window, *e*, is occasionally a little opened; but it is at all times covered with a roller-blind, so that the fruit is kept in the dark. A little fire in the stove, air being freely admitted by the window at the same time in a dry day, is useful for speedily removing any damp which may arise from the fruit. The shelves, *a a*, have a layer of clean-drawn straw laid across them, and on this the fruit is placed singly.

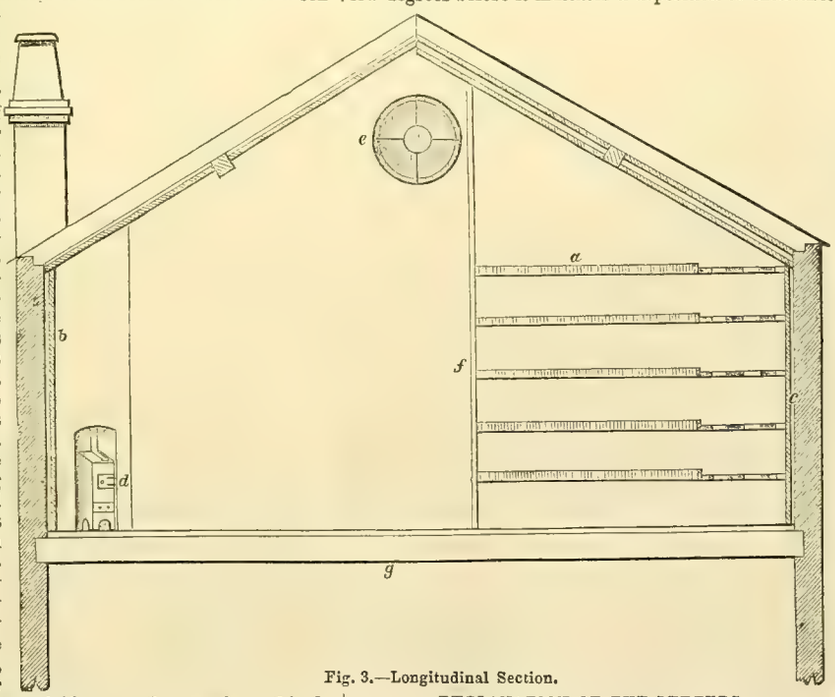

Fig. 3.—Longitudinal Section.

EXPLANATION OF THE LETTERS.

*a*. Shelves made with battens, 1½ inch wide, and 1¼ inch apart.
*b*. Close boarding around the sides of the room.
*c*. Air space between the boarding and the wall. The roof also has an air space on the north side between the two plaster ceilings, as shown on the section.
*d*. Stove.
*e*. Circular window hung on pivots, and fitted with a roller-blind.
*f*. Partitions of open work similar to the shelves.
*g*. Coach-house under fruit-room.

"From a consideration of all the above details it may be inferred, that if a fruit-room be built over a place where there is a free circulation of air, its roof double ceiled, the walls lined with wood, a cavity being left between these two, it will possess the essential properties of the one under consideration.

"The more important principles necessary to attend to, with regard to the long keeping of fruit, are uniformity of temperature, coolness, and darkness.

"If the temperature is uniform, there can be little or no deposition of moisture on the surface of the fruit; but if the air of the room should be, say 10 degrees warmer than the fruit, then the relative coldness of the latter will cause a condensation of the moisture contained in the air in contact with the fruit, just as a cold glass becomes dewed over when brought into a warm atmosphere. If the air is indeed very dry, then a proportionally greater difference of temperature is necessary to produce the above effect; but in winter the hygrometer seldom requires to be cooled more than a few degrees before it indicates a deposition of moisture.

Fruits, with smooth, glossy skins, in close contact with the cold substance beneath them, are those most profusely covered with moisture from the above cause. In russeted varieties their dry, rough coats, serve as non-conductors of heat, and hence less moisture is deposited on them. When the air becomes colder than the fruit, a contrary action—that of evaporation—takes place, and the surface of the fruit becomes dry. But this wetting and drying must prove very injurious; whilst its cause, alternations of temperature, must likewise affect the specific gravity of the juices of the fruit. Mr. Moorman's fruit is not exposed to such vicissitudes; for when the weather becomes frosty, it is several days before the thermometer in his fruit-room is affected as much as one degree.

"It may be remarked that in giving air a period of the day should be chosen when the thermometer outside indicates the same temperature as that in the room. No deposition of moisture can then take place in consequence.

"With regard to coolness, it is well known that this condition is favourable to the long-keeping of fruit; for we act on the contrary when we wish to render any variety fit for use before its usual time. The fruit-room in question must be cooler on an average, than if it had been on the ground, for the latter, under a building particularly, is much warmer than the air in winter.

"Light accelerates the maturity and ultimate decay of fruit exposed to its influence. If the soundest specimens are picked and placed opposite a window, they soon become much inferior in appearance, compared with those from which the light is excluded, all other circumstances being the same. In Mr. Moorman's fruit-room, the light is excluded by a blind, even when air is given.

"By such arrangements as those above detailed, Mr. Moorman keeps the Marie Louise in fine condition till after Christmas. He possesses a selection of the best varieties of Pears, which he grows chiefly on Espaliers, which are well managed by his gardener, Mr. Tucker, in the Clapham-road. He had some remarkably handsome specimens of the Winter Nelis in his fruit-room in January, much larger than that excellent variety usually grows. We have also seen very large specimens of the Marie Louise, grown at his seat at Box Hill, in Sussex. The tree which produced them is trained against the gable end of a barn, about a quarter of a mile from the sea, and this tree is exposed to the strong sea-breezes from the south-west. It was planted in good soil, and a spring below it was discovered when digging the hole for the compost, previous to the tree being planted."

## Home Correspondence.

*Cloth of Gold Rose.*—I see that "A Correspondent" pleads the cause of this Rose. I think that it is supposed to be more difficult to manage than it really is. I have had one now for several years, which has bloomed well and freely. It stands against a south wall, has no other plants against which to struggle intruded upon it, is well fed, and sharply pruned; it grows in a soil which is naturally poor and sandy, but it has a barrow load made up of stable litter and burnt refuse, or of stable litter and loam, given to it each year. I think it possible that Cloth of Gold has got the character of being a shy bloomer from being grown upon its own roots; in that form I do not think it will succeed; at least, I do not know of any plant of it thus grown successfully. Mine is budded upon a Dog-rose, but Celine, I believe, makes a better stock for it than any other Rose does. I have found some of my best blooms come from shoots which I have laid into the ground, after drawing them down from the wall against which my tree grows. Such shoots have thrown other strong fleshy shoots from the point at which the laid shoot comes out of the ground again, and upon these I have had splendid blooms. I believe that Cloth of Gold only requires liberal treatment, and a little patience, in order to secure such a bloom as will amply repay the grower of it. *C. E. C., Shirley.*

*Large Scarlet Thorn.*—In the kitchen garden, at Elderslee House, near Renfrew, in Scotland, is a scarlet flowering Thorn 30 feet high, 39½ feet across the branches, from east to west, and rather more from south to north, the stem being 6 feet 5 inches in circumference, at 18 inches from the ground. Its age is not known. It is about 80 years since the garden was first formed; but before that the old Mansion House of King's Inch stood close to where the kitchen garden now is, and the tree may perhaps have been growing there, and spared when the garden was inclosed. It is in vigorous health, and appears to be liberally availing itself of the good things provided for its humbler associates, the lower branches touch the ground, and in some places, having struck root, are growing vigorously. When in full bloom it is a splendid object. *G. Aitken, Kilmarnock.*

*The Mocking Bird.*—I have often been surprised that none of your correspondents have noticed the wonderful imitative powers of the mocking-bird (Sylvia salicaria), whose notes hit off with such exactness so many of the other small birds. In listening to one, the other day, for about a quarter of an hour, I heard it give the notes of the sparrow, swallow, whinchat, spring wagtail, starling, martin, chaffinch, whitethroat, greenfinch, little redpole, and whin-linnet, besides the notes of half a dozen birds which I did not know; at least I have no right to assert that they were not imitations because I did not happen to recognize them. The alarm notes of other birds are those most frequently imitated; but though this is generally the case, it is not invariably so, for instance, in addition to the alarm note of the swallow "chizzee, chizzee," it also had the "whit, whit," which the swallow uses as it flies about, and the chatter of satisfaction, not the song, which one often hears when two swallows are arranging their plan of operations in a barn in the spring. Again, in addition to the shriek of the martin, there was the note it utters when on the wing, in pursuit

of its food; there was also the chirrup of the greenfinch, and the "whee, whee, whee," which is the climax of the song of a whin-linnet, and which is so irresistible in it as a call-bird, and which appears to bring down the flock, almost in spite of themselves. Although the bird imitated all those I have mentioned, it made much more frequent use of some than of others. The sparrow, the white-throat, the spring wagtail, the starling, the whin-chat, and the swallow, appeared to be its chief favourites; whilst it only touched once or twice on the notes of the greenfinch and whin-linnet; it was also very sparing in its use of the chaffinch's note, until one in the neighbourhood began "twink, twink, twink," then the mocking-bird took it up, and twinked away for 50 times together. Next morning the whin-linnet's note was in much greater use, and it also made much more use of notes with which I was not acquainted. On neither day did it touch upon the notes either of the redstart or pied wagtail, both of which I have heard frequently used by the mocking-bird before. On the other hand, I have not previously noticed the notes of the starling and the whin-linnet, which this bird gave in perfection, and, therefore, though I never heard it make use of the notes of any of the larks or thrushes, I would not be understood to say that this never happens. I shall be glad if what I have said shall draw the attention of any of your correspondents to the bird; for although its song, from the strange mixtures it makes, is not very pleasing, it still shows amazing powers of imitation from the "chue chue" of the sparrow to the climax of the whin-linnet's song. The note of every bird is given with such fidelity of tone and expression, that if it were not interlarded with all sorts of incongruous sounds, I would defy the most practised ear to discover that it was only an imitation. It is perhaps difficult to say whether it has a note of its own which is not used by any other bird; but there is one which it always makes use of when any one approaches the nest (interlarded, however, with the notes of the swallow, whin-chat and white-throat) that is "chur-r-r chur-r-r," prolonging the sound of the *r* in a way that would set up the half of Northumberland. *T. G., Clitheroe.*

*Weeds.*—Trite and commonplace as the subject may be, I am quite sure that the observations in your leader of Saturday last will not only be of much use and benefit among the members of the profession, but will be thankfully acknowledged by many persons, and particularly so by ladies who, like myself, from occasional absence from home, and other causes, cannot pay that regular attention to their gardens which, notwithstanding all the improvements both in the education and circumstances of their gardeners, is too often necessary and required to enforce and preserve habits of order and tidiness, that comprehensive qualification in every servant which, in the assumption of higher recommendations, is too often neglected or forgotten; and the want of which, as you must well know, is a frequent source of dissatisfaction with men not at all deficient in higher qualities and abilities; and although observations upon these points do frequently appear in the *Gardeners' Chronicle*, they seem to receive by no means that consideration which a special and prominent notice occasionally from you is more likely to produce. As you, among others, apply the term profession to the art of gardening I have done the same, but Dr. Johnson tells me that the term craft or vocation would be applied with much greater propriety in this instance, as well as to domestic servants, hair-dressers, tailors, dancing-masters, tavern-keepers, and many other highly respectable occupations, which you as a public authority ought to attend to, and to discourage that which is not only untenable, but ridiculous. *A Lady, Sept.* 23. [We accept Dr. Johnson as an authority in the application of words as understood in his time; but not as an authority in their application now. You will find this point discussed at some length in our columns a year or two ago.]

*Fuchsias.*—Having recently written in praise of Fuchsia corallina, which I still think the finest dark variety in cultivation, it may not be amiss to express my admiration of a descendant, which I have recently been introduced to in the conservatory of the raisers, Messrs. Lucombe and Pince, of Exeter. The seedling in question will be sent out under the name of Princess, and will certainly rank high in the estimation of the admirers of this beautiful tribe. Its colour is clear bright crimson, with a brilliant purple corolla; the flowers are large, and produced abundantly, but its chief characteristic is the peculiar reflexion of its wax-like sepals, which turn back in a manner possessed by no other Fuchsia, and which render it conspicuously beautiful among a host of the rarest varieties. *A Devonian.*

*Potatoes.*—Perhaps the following particulars, remarked by my gardener, respecting the crop of Potatoes here, may interest you:—In the lighter land, there were very few diseased tubers of any sort. In a strong loam, different sorts were very differently affected. A lot of Dublin Apples had about one-half diseased; while a lot of Blue Farmer's Glory adjoining, had scarcely a diseased tuber. In a strong loam, the Manchester Radicals produced a good crop, but nearly one-third diseased, where exposed to the sun and air; whereas, on a part of the ground shaded by a Beech tree, about 16 yards in diameter, the crop was about one-fourth lighter, and the Potatoes smaller; but there was not a diseased tuber, as far as the drip of the branches extended. *L. L., Salop.* [Should we not read *dried* for *shaded?*]

*Pruning Forest Trees.*—You very justly censured a correspondent, a week or two ago, for criticising a work which he had never read. Permit me to say that "Quercus" has laid himself equally open to reproof. He accuses me of being an advocate for pruning forest trees, and founds his accusation on the false inferences drawn by another correspondent in a previous communication. How, from what I have said in the articles to which "Expertus," and after him "Quercus" alludes, any one can accuse me of being an advocate of forest pruning, I am at a loss to imagine. On the contrary, I endeavoured to make apparent some of the glaring injuries which timber sustained under the practice. I am equally as sensible of the ill effects of pruning as "Quercus" can be; and I can assure him that I have examined the specimens in the museum at Kew, to which he alludes, as well as hundreds of others, and he will find some of them figured in last year's volume of the *Gardeners' Chronicle*. Apart from the injustice of criticising a performance without having seen it, no one is desirous of having strictures passed upon work while in a half finished state, and the articles in question were intended as prefatory to some other remarks I had intended to offer on a physiological view of the subject matter. An error in judgment is excusable; it is only indicative of the fallibility of human reasonings; but to condemn without judgment is unpardonable. I shall wait anxiously for the promised communications of "Quercus." *G. L.*

*The Maiden Hair Tree.*—In the gardens of the Duke of Bedford, at Oakley House, is a specimen of this tree (Salisburia adiantifolia), 30 feet high, the same through its branches, with a boll 3 feet in circumference, at 6 feet from the ground. This specimen is a very fine and beautiful one. Allow me to ask some of your correspondents if they are aware of larger specimens of this very handsome tree. *Occasional Tourist.*

*Monstrous Fuchsia.*—One of my neighbours has a Fuchsia which certainly presents a remarkable instance of monstrous growth. I do not know the name of the variety, but it is one of those which have the calyx of a flesh colour. The tube is fully twice the ordinary circumference, and correspondingly long; and its sepals are in the form of twelve distinct segments, only narrower than is common, while all the other parts of the flower and fructification are correspondingly enlarged or multiplied. The petals of the corolla are more numerous than is common; the stamens are 18 or 19 in number, all perfectly formed, and producing the pollen as usual; and the pistil is of a very singular formation, being a kind of club-shaped body, increasing in diameter towards the stigma, which latter is an oblong mass, a quarter of an inch or more across, and presenting numerous blunt projecting points at its extremity, as if to correspond with the multiplicity of the other organs of reproduction. The pericarp or seed vessel is similarly enlarged, and the flower-stalk corresponds in length and thickness with the other details of unusual development. The plant bears numerous other flowers, besides the one more particularly referred to; but excepting it, they are all of the ordinary size and form. The owner proposes to preserve and plant the seed which may be yielded by this monstrosity, in order to see whether the produce will be anything like itself. We are, of course, desirous of knowing, if possible, how the extraordinary formation is to be accounted for. *K., Oxford.* [Such accidental monsters are by no means uncommon in Fuchsias, and are probably the result of excessive vigour.]

*Aquatics.*—What a pity it is that the large sheet of water in front of the noble conservatory in Kew Gardens, should be allowed to remain empty. Not a single aquatic, foreign or English, does it contain. I would suggest that it be heated, which could easily be done, as a great deal more heat is generated than is required for the conservatory, and the whole sheet of water filled with Victoria Regia and other aquatics, which would have a splendid effect, and give great *éclat* to the gardens. There is nothing connected with gardening in which there is more room for improvement than in the way of aquariums. *An Old Subscriber.*

*American Aloe.*—A fine specimen of the Agave Americana is now in bloom here, the flowering of which was looked forward to with considerable interest, the plant having been in the possession of the family for more than 80 years. The flower-stem, which showed itself on the 10th May last, is now 23 feet high, and is surrounded by 27 branches arranged in a pyramidical form with perfect symmetry, each branch containing from 150 to 160 flowers. The first blossoms were developed on the 2d of September. *James Reid, Gardener, &c., Ashton Court.*

## Reviews.

*British Pomology; or the History, Description, and Classification of the Fruits and Fruit-trees cultivated in the Gardens and Orchards of Great Britain; together with a complete enumeration of their synonymes, with their citations, and references to the works in which the different varieties are figured, forming a complete work on the "Systematic Pomology of this Country." Illustrated with numerous engravings.* By Robert Hogg. Groombridge and Sons. Parts 1 to 4; 8vo., to be continued monthly.

THE object of "British Pomology," we are informed, is to supply a want which has long been felt by the cultivators of fruits and fruit-trees, and to furnish those who are interested in their cultivation with a work which shall embrace all the information attainable, regarding the numerous varieties cultivated in this country. All the varieties of fruits which are recorded either in other works on Pomology, or in the nurserymen's catalogues, as existing in this country, are to be minutely described, including, it is stated, the New Belgian Pears raised by Esperen, Bivort, Bouvier, and others, together with the posthumous varieties of Dr. Van Mons. The four parts of the work which are now before us afford good indication that the prospectus will be ably carried out. So far, the enumeration of Synonymes, with their citations, is certainly the most complete and extensive which has hitherto been published. The works of English and foreign authors, ancient and modern, have been carefully consulted. The work, however, is not a mere compilation, for the author has evidently great practical knowledge of the various subjects. It is abundantly illustrated by well-executed outline woodcuts, and, when complete, will form an interesting, and, to gardeners, most useful volume. The two following extracts show Mr. Hogg's manner of treating his subject. Speaking of the Ribston Pippin, he says:—

"There is no Apple which has ever been introduced to this country, or indigenous to it, which is more generally cultivated, more familiarly known, or held in higher popular estimation, than the Ribston Pippin. It has long been in existence in this country, but did not become generally known till the end of the last century. It is not mentioned in any of the editions of Miller's Dictionary, or by any other author of that period; neither was it grown in the Brompton Park nursery in 1770. In 1785 I find it was grown to the extent of a quarter of a row, or about 25 plants; and as this supply seems to have sufficed for three years' demand, its merits must have been but little known. In 1788, it extended to one row, or about 100 plants, and three years later to two rows; from 1791, it increased one row annually, till 1794, when it reached five rows. From these facts we may pretty well learn the rise and progress of its popularity. It is now in the same nursery cultivated to the extent of above 25 rows, or 2500 plants annually.

"The original tree was first discovered growing in the garden at Ribston Hall, near Knaresborough, but how, when, or by what means it came there, has not been satisfactorily ascertained. One account states that about the year 1688, some Apple pips were brought from Rouen and sown at Ribston Hall, near Knaresborough; the trees then produced from them were planted in the park, and one turned out to be the variety in question. The original tree stood till 1810, when it was blown down by a violent gale of wind. It was afterwards supported by stakes in a horizontal position, and continued to produce fruit till it lingered and died in 1835. Since then, a young shoot has been produced about 4 inches below the surface of the ground, which, with proper care, may become a tree, and thereby preserve the original of this favourite old dessert Apple. The gardener at Ribston Hall, by whom this Apple was raised, was the father of Lowe, who during the last century was the fruit tree nurseryman at Hampton Wick."

Each fruit is described in alphabetical order, upon the following plan, the length of the article varying with its importance.

"288.—RED-STREAK. Evelyn.

"IDENTIFICATION.—Evelyn Pom. Worl. Vin. 164. Nourse Camp. Fel. 143. Fors. Treat. 123. Lind. Guide, 110. Pom. Heref. t 1. Down. Fr. Amer. 146.

"SYNONYMES.—Herefordshire Red-Streak, *Hort. Soc. Cat.* ed 3, n 625. Scudamore's Crab.

"FIGURES.—Pom. Heref. t. 1. Brook. Pom. Brit. pl. xciii. f. 4.

Fruit, medium sized, 2¾ inches wide, and 2¼ inches high; roundish, narrowing towards the apex. Skin, deep clear yellow, streaked with red on the shaded side; but red, streaked with deeper red on the side next the sun. Eye small, with convergent segments, set in a rather deep basin. Stalk, short and slender. Flesh yellow, firm, crisp, and rather dry. Specific gravity of the juice, 1·079. A cider Apple, which at one period was unsurpassed, but now comparatively but little cultivated. Perhaps there is no Apple which at any period created such a sensation, and of which so much was said and written during the 17th century, as of the Red-Streak. Prose and verse were both enlisted in its favour. It was chiefly by the writings of Evelyn it attained its greatest celebrity. Philips, in his poem—'Cyder,' says

> 'Let every tree in every garden own
> The Red-Streak as supreme, whose pulpous fruit,
> With gold irradiate, and vermilion, shines
> Tempting, not fatal, as the birth of that
> Primæval, interdicted plant, that won
> Fond Eve, in hapless hour to taste, and die.
> This, of more bounteous influence, inspires
> Poetic raptures, and the lowly muse
> Kindles to loftier strains; even I perceive
> Her sacred virtue. See! the numbers flow
> Easy, whilst, cheer'd with her nectareous juice,
> Her's, and my country's praises, I exalt.'

But its reputation began to decline about the beginning of the last century; for we find Nourse saying, 'As for the liquor which it yields, it is highly esteemed for its noble colour and smell; 'tis likewise fat and oily in the taste, but withal very windy, luscious and fulsome, and will sooner clog the stomach than any other cyder whatsoever, leaving a waterish, raw humour upon it; so that with meals it is no way helpful, and they who drink it, if I may judge of them by my own palate, will find their stomachs pall'd sooner by it, than warm'd and enliven'd.'" The Red-Streak seems to have originated about the beginning of the 17th century, for Evelyn says, 'it was within the memory of some now living, surnamed the Scudamore's Crab, and then not much known save in the neighbourhood.' It was called Scudamore's Crab, from being extensively planted by the first Lord Scudamore, who was son of Sir James Scudamore, from whom Spenser is said to have taken the character of Sir Scudamore in his 'Fairie Queen.' He was born in 1600, and created by Charles I. Baron Dromore and Viscount Scudamore. He was attending the Duke of

Buckingham when he was stabbed at Portsmouth, and was so affected at the event that he retired into private life, and devoted his attention to planting orchards, of which the Red-Streak formed the principal variety. In 1634 he was sent as ambassador to France, in which capacity he continued for four years. He was a zealous royalist during the civil wars, and was taken prisoner by the parliament party, while his property was destroyed, and his estate sequestered. He died in 1671."

## FLORICULTURE.

Slough Dahlia Show.—If there be one locality more floricultural than another, it is Slough. Permit me to direct attention to the forthcoming meeting, which will, as usual, be under the guidance of Mr. Bragg. I have only to refer to the announcement of the meeting in our advertising columns of to-day, to insure a numerous gathering. Flowers ready at 11 o'clock. Dinner at half-past 2. *J. E.*

Hollyhocks.—I have been solicited to give the names of the 12 spikes of Hollyhocks which obtained the 1st prize at the late Shacklewell Show. Notes were made of them at the time, but the length of the report, even condensed as it was, precluded us from giving much that was both interesting and valuable. The varieties in question were as follows:—Rembrandt, Safranot, Enterprise, Dido, Dazzle, Lady of the Lake, Queen of Scots, Picta, Brilliant (seedlings of the exhibitor, Mr. Parsons), Model of Perfection, Enchantress (Chater), and Rosea grandiflora (Baron). I would here observe, that the six spikes exhibited by Mr. Parsons, at the last meeting in Regent-street, even surpassed that grower's former productions; they were, indeed, superb. *J. E.*

## Societies.

Bath Royal United Horticultural, *Sept.* 11.—At the fifth show of the season, which was held on this occasion, there was, in addition to other things, a good display of florists' flowers. Miss Bayly obtained a 1st prize for the best collection of 6 Fuchsias, which consisted of Unique, Don Giovanni, Favourite, Delicata, Carolina, and Penelope; the 2d prize was awarded to Mr. Wheeler, for Fountain, Rosa Quintal, Admirable, Orion, Julia Grisi, and Sir John Falstaff. Scarlet Geraniums, collections of 6 varieties: Miss Bayly obtained a 1st prize for Tom Thumb, Commander-in-Chief, Hero of Bristol, Perpetual Queen, 'Squire Smith, and Shrubland Queen. Balsams: 1st prize, Miss Bayly—the only collection exhibited. Cockscombs: two nice collections—1st prize, Mr. Wheeler; 2d, Mr. G. Fuller. Dahlias—there were two Silver Cups offered for competition: that for Amateurs was awarded to J. M. Yeeles, Esq., whose collection consisted of John Edward, Mrs. Seldon, Sir R. Peel, Nil Desperandum, Beeswing, Snowflake, Black Prince, Duke of Cambridge, Duke of Wellington, Queen of Lilacs, Purple Standard, Nonpariel, Miss Chaplin, Mynn, Lady St. Maur, Sir F. Bathurst, E. Dorado, Seraph, Shylock, Richard Cobden, Atlas, Crocus, Essex Triumph, and Fearless; the Cup for Nurserymen was won by Mr. Drummond, for a collection consisting of Snowflake, Imbricata, John Edward, Sir R. Peel, Mrs. C. Bacon, Mr. Seldon, Beeswing, Queen of Lilacs, Queen of Beauty, Sir F. Bathurst, Shylock, Seraph, Lady St. Maur, Portia, Queen of Whites, Duke of Wellington, Mrs. Seldon, Essex Triumph, Earl of Clarendon, El Dorado, Miss Chaplin, and Marchioness of Cornwallis; in the Amateurs' Class, the 2d prize was awarded to Mr. H. Bush; and Certificates of Merit to J. Edwards, Esq., and Mr. Fisher; in the Nurserymen's Class, the 2d prize was awarded to Mr. Sealey. Nine distinct varieties: there were five collections in this class—Mr. C. Sainsbury obtained a 1st prize for a stand consisting of Sir R. Peel, Bob, Tom, Hon. Mrs. Ashley, Seraph, George Glenny, Marchioness of Cornwallis, Duke of Wellington, and El Dorado. Fancy Dahlias, collections of nine varieties: the 1st was awarded to Mr. Drummond for Mrs. Hansard, Rob Roy, Miss Compton, Elizabeth, Madame Bresson, Gasparini, Striata Perfecta, Elegantissima, and Pompey; 2d, Mr. Griffin. Hollyhocks: in collections of 24 varieties, for Amateurs, Mr. Fisher obtained 1st prize; and A. Brettle, Esq., 2d prize. In collections of 36 varieties for Nurserymen, Mr. Wheeler obtained 1st prize; Mr. Drummond 2d; and Mr. Hooper a Certificate of Merit.

Cheltenham, *Sept.* 11.—The third and last Floral Exhibition of the season took place, as usual, at Pittville, under very favourable circumstances. The following are some of the prizes awarded for floricultural productions. Dahlias were scarce—Collection of 18, distinct varieties: 1st prize, Earl of Clarendon, Thames Bank Hero, Crocus, Purple Standard, the Queen of Lilacs, Drummond's Felix, Richard Cobden, Daniel's Elizabeth, Beeswing, Yellow Standard, Mr. Seldon, Privateer, Grenadier, Marchioness of Cornwallis, Shylock, Rose D'Amour, Miss Vyse, and Scarlet Gem—Mr. Heath; 2d, Mr. Dale. Ditto (Collection of 12, distinct varieties): 1st prize, Lord Mayor, Crocus, General Negrier, Purple Standard, Duchess, Shylock, Imbricata, Privateer, Scarlet Gem, Mrs. Bacon, Fearless, and Felix—Mr. Courtenay; 2d, Mr. Hurlston. The varieties exhibited in both groups were remarkably beautiful—we seldom, indeed, saw more perfect blooms, or the colours of which were so firmly set, than were those of Messrs. Heath and Dale in the collections of 18, or of Mr. Courtenay and Mr. Hurlston in the minor collections of 12. Fuchsias (Collection of 8): 1st prize, Miss M. Phillips; 2d, Mr. Clark. German Asters (Collection of 12): 1st, Mrs. Walters; 2d, J. Webster, Esq.; 3d, Mr. Heath. A rare and beautiful collection of Ferns, exhibited by G. Reed, Esq., of Burnham, was especially commended by the judges, and awarded an extra prize by the committee. Messrs. Veitch also contributed some valuable plants.

Highgate, *Sept.* 24.—Twelve Dahlias (amateurs), 1st prize to Mr. J. Edwards, for Princess Louisa, Mrs. Seldon, Queen of Lilacs, John Edward, Mr. Seldon, Fearless, Snowflake, Richard Cobden, Thames Bank Hero, Miss Chaplin, Admiral, and George Glenny; 2d, to Mr. Weedon, for Mr. Seldon, Psyche, Negro, Earl Clarendon, Nil Desperandum, Essex Triumph, Duke of Wellington, Admiral, Yellow Standard, Sir F. Bathurst, Anticipation, and Snowflake; 3d, to Mr. Prockter, for Mrs. C. Bacon, Princess Louisa, Fame, George Glenny, Essex Triumph, Admiral, Queen of Lilacs, Duke of Wellington, Fearless, and Privateer; 4th, to Mrs. Jeffrey, for Fame, Mrs. Seldon, Thames Bank Hero, Mr. Seldon, Princess Radzivil, Beeswing, Barmaid, Duke of Wellington, Seraph, Essex Triumph, Roundhead, and Fearless; 5th, to Mr. Bennett, for The Hero, California, Mrs. C. Bacon, Queen of Beauties, Queen of Lilacs, Imbricata, Fame, Beeswing, Mr. Seldon, Duke of Wellington, Duke of Cambridge, and John Edward; 6th, to Mr. Hunt, jun., for Fearless, Sir R. Peel, Queen of Lilacs, Earl of Clarendon, Duke of Wellington, George Glenny, Sir F. Bathurst, Duke of Cambridge, Mr. Seldon, Shylock, Nepaulese Prince, and Carmina; 7th, to Mr. Wakeman, for The Hero, Fearless, Mrs. C. Bacon, Mr. Seldon, Richard Cobden, Privateer, Essex Triumph, Imbricata, C. Turner, Beeswing, Duke of Cambridge, and King. There were 11 exhibitors in this class.—6 Fancy Sorts: 1st, Mr. J. Edwards, for Highland Chief, Mrs. Hansard, Miss Compton, Queen of Fairies, Flying Dutchman, and Cantivation; 2d, Mr. Prockter, for Lady Cullum, Madame Wachy, Mrs. Hansard, Lady Grenville, Miss Compton, and Miss Weyland; 3d, Mr. Bennett, for Dandy, Keepsake, Adolphe Dubras, Gasperine, Lady Grenville, and Empereur de Maroc. Six new sorts let out in 1851 by Mr. Turner: 1st, Mr. J. Edwards, with Goliath, Regina, Mr. Palmer, Roundhead, Sir C. Napier, and Nepaulese Prince; 2d, Mr. Prockter, with Goliath, Duke of Rothsay, Jullien, Napoleon, Roundhead, and Sir C. Napier. Dealers, 24 kinds: 1st, to Mr. Bragg, for Mr. Seldon, El Dorado, Fame, George Glenny, Duke of Wellington, Queen of Beauties, Yellow Superb, Mr. Herbert, General Faucher, Essex Triumph, Toison d'Or, Sir R. Peel, Admiral, Barmaid, Earl Clarendon, Queen of Lilacs, Miss Chaplin, Shylock, Queen of Beauties (Mitchell), Privateer, Queen of the West, Sir F. Bathurst, Hon. Mrs. Ashley, and Carmina; 2d, Mr. Hunt. 12 Fancies: 1st, Mr. Bragg, with Highland Chief, Vulcan, Princess Charlotte, Flying Dutchman, Rachael, Mrs. Hansard, Lady Grenville, Miss Weyland, Miss Compton, Gasperine, Queen of Fairies, and Pretty Polly; 2d, Mr. Hunt. Certificates were awarded to Morning Star (Turner); to Ariel (Turner), a bold white; to Malvina (Turner); to Phantom (Bragg) an orange previously noticed; to a fancy without name (Bilmer), for its colour, deepest maroon, with white tips; other seedlings consisted of Miss Ward, Edmund Foster, and Scarlet King; the latter is noticed in "Answers to Correspondents." Hollyhocks were shown by Mr. Bragg and by Mr. Holden. Fuchsias by Mr. G. Smith, 1; Mr. Batten, 2; Mr. Cragg, 3. Also by Mr. M'Ewen, 1. Certificates were granted to Fuchsia, Nil Desperandum (G. Smith), a dark variety; to Verbenas, Ariel, National, and Alba Magna, all from Mr. G. Smith, and prizes awarded to Ariel and National as being the best and second best produced. The former is a full-sized blush white with purple eye; the latter is a neat bright rosy pink, remarkable for the symmetry of its truss. Collections of Verbenas were set up by Mr. Lochner (1), the variety being Desdemona, St. Margaret, Laura, Figaro, Reine Hortense, Buonaparte, Macrantha, Exquisite Beauty, Grandis, British Queen, and Voltigeur. 2d, Mr. Young, who produced his nice seedling, Delight. Six new Verbenas: 1st, Mr. Lochner; 2d, Mr. Young. Dealers; 24 Verbenas: 1st, Mr. G. Smith; 2d, Mr. Steward. Best specimen Fuchsia, for any variety let out this season: 1st, Mr. Batten, with his Clapton Hero. A prize was awarded to Petunia Striata, from Mr. Steward. Charming groups of cut Roses were displayed by Mr. Wilkinson, Ealing.

Southampton, *Sept.* 5.—A Silver Cup, offered to private growers by J. Colt, Esq., for the best 24 Dahlias, was awarded to Mr. Edwards, Holloway, whose varieties were Earl of Clarendon, Richard Cobden, General Faucher, Mr. Seldon, Baltic, Thames Bank Hero, Leda, Beeswing, Admiral, Miss Herbert, Sir F. Bathurst, Barmaid, Nil Desperandum, Duke of Cambridge, Essex Triumph, Duke of Wellington, Elizabeth, Model, Fearless, Yellow Standard, Summit of Perfection, Sir C. Napier, Nepaulese Chief, and Mrs. Herbert.

Taunton, *Sept.* 17.— A Silver Cup was awarded to Mr. Keynes, of Salisbury, for the following 24 Dahlias: Queen of Lilacs, John Edward, Fearless, Mr. Seldon, Duke of Cambridge, Model, Thames Bank Hero, Earl Clarendon, Negro, General Faucher, Princess Radzivill, Shylock, Queen of the East, Lady St. Maur, Miss Vyse, Richard Cobden, Una, Triumphant Miss Chaplin, Magnificent, Beauty of Kent, Douglas Jerrold, Sir F. Bathurst, and Yellow Standard. Certificates were awarded to Una, Triumphant, Nancy, and Laura Lavington; flowers which have well maintained their high positions during a long and trying season.

Wallingford, *Sept* 10.—This was the last show of the season. The Thame band, and delightful weather, brought together a fashionable company. Dahlias were the principal attraction. The Society's handsome Medal, value five guineas, was offered for the best 100 blooms, which brought together four collections. The 1st (medal) was awarded to Mr. C. Turner, Slough; 2d, Mr. Bragg, Slough; 3d, Mr. Willmer, Sunbury; 4th, Messrs. Tyso, Wallingford (perhaps the finest bloom exhibited this season was Richard Cobden, as shown on this occasion). The following were also particularly good: Mr. Seldon, Model, Sir C. Napier, Fearless, Nepaulese Prince, Essex Triumph, Queen of Lilacs, Mrs. Seldon, Summit of Perfection, Mr Palmer, Leda, Mr. Herbert, Fairy Queen, Admiral, Morning Star, Sir F. Bathurst, Princess Louise, Hon. Mrs. Ashley, Blanchfleur, Mrs. Willis, Rachael, Empereur de Maroc, Mrs. Hansard, Miss Compton, Lady Grenville, Elegantissima, Nonpareil, Sir R. Peel, Nil Desperandum, Seraph, and Queen of Dahlias. *J. E.*

Whitby Amateur Floricultural, *Sept.* 16.—Dahlias were exhibited in great variety, and in good condition. 12 varieties: 1st, Mr. S. Anderson, with Sir F. Bathurst, Beeswing, Yellow Standard, Magnificent (Edwards), Snowball, Grenadier, Premier (Leg), Mr. Seldon, Lord Mayor (Edwards), Capt. Warner, Shylock, and Thames Bank Hero. The same exhibitor also obtained the first prize for six varieties, consisting of Lord Mayor, Duke of Wellington (very fine), Seraph, Yellow Standard, and Thames Bank Hero. Mr. Edwards, of York, gave a very beautiful Silver Fish Knife and Fork for the best 6 Dissimilar Blooms, which were obtained by Mr. Anderson, with Lord Mayor, Shylock, Beeswing, Seraph, Sir F. Bathurst, and Duke of Wellington. In class showing, Mr. Edwards, of York, exhibited 24 blooms; among which we noticed California (a good yellow), in excellent condition. The same party also exhibited 24 Fancies. — Mr. Willison, of Whitby, showed a number of Seedlings, among which were some promising flowers. One, named Dr. Young, received a Certificate and a seedling prize; colour rich, deep maroon, outline perfect, and size average. If it proves constant, it will be a useful variety.—Verbenas were good, but there was no novelty.—An extra prize was awarded to Mr. Blake, of the Mulgrave Gardens, for a fine collection of China Asters, some of which in size and proportion were almost equal to the Dahlia.—At a dinner, in the evening, the honorary secretary, Mr. M. Woodhouse, was presented with an elegantly-chased silver tea-pot, in acknowledgment of his services and zeal in promoting the interest of floriculture.

---

Auriculas: *Anon.* Dickson and Willmer, south; Holland, north; Lightbody, far north. *J. E.*

Catalogues: Several autumn trade lists have been received; they are all welcome. *J. E.*

Fancy Dahlias: *R C.* It does not appear, judging from your account, that either flower is of the fancy class. *J. E.*

Ranunculus; *Fairford.* Tyso (of Wallingford), on "The Ranunculus, and how to grow it," will answer your purpose. *J. E.*

Stoke Newington Dahlia Meeting: This must stand over till next week. *J. E.*

Stowmarket: *Anon.* The papers have been returned to the secretary; post paid, of course. *J. E.*

SEEDLING FLOWERS.

Asters: *Jacquin.* Les fleurs sont larges et belles, les couleurs d'une beauté extrême. La variété blanche est d'une excellente forme, qui nous rappelle le Chrysanthemum "Veeta." La fleur épanouie d'un pourpre varié des lignes blanches, doit de tout autre (par sa beauté) se trouver favorite parmi les dames; savoir si le semence produit regulièrement la même espèce de fleur?*

Calceolarias: *Sub, Watford.* Packed in dry moss, and so shrivelled that nothing can be said respecting its form. The yellow is of a deep yet brilliant shade.*—*H M.* Pleasing varieties, whose qualifications were freely discussed at the Highgate exhibition, where all were more or less admired.*

Hollyhocks: *P. Baldridge.* Expertus is a cheerful, rosy pink; of good size, but scarcely full enough in the centre. Bicolor grandiflora was too much damaged when received for determination of its merits. Mr. Lunn is dull coloured, and much serrated on the edges. The other bloom is similar in colour to the variety named, but is a bad specimen to judge of size.*

Pansy: *J H B.* An improvement on Mary Jane, being free from the folds in the side petals of that variety; it has, however, its faults, and would not do in a stand of 24 for quality only.*—*A. P.* We have never before seen Pansies sport as yours has done. Seedling raisers, like travellers, see strange sights.*

Pelargoniums: *E Carpenter.* An excellent scarlet, robust in habit, and a profuse bloomer; trusses very large; each pip of excellent shape; petals substantial; together forming a globular head, rarely deformed by seed vessels; colour brilliant. A variety which is sure to become a favourite.*

Pines: *J K.* To hand: we await the second delivery.*

Salvia: *Dean.* Flowers large and fine, but apparently not different from those of S. patens.*

## Miscellaneous.

*Cotyledon orbiculata.*—In Mr. Penney's notice of two species of Cotyledon, in your number for the present month, it is stated that Dr. Pappe describes a plant (the Cotyledon orbiculata) of the same genus as the Cotyledon umbilicus, the leaves of which are stated to form an excellent application to hard corns. In this neighbourhood the Cotyledon umbilicus is well known, and is in high repute with the country people as a remedy for corns and warts: many persons have informed me of the entire removal of corns after a few applications; and that the juice of the plant is a useful remedy in inflammatory swellings. The House-leek (Sempervivum tectorum) of the Crassulaceous order, is also famed for its application to corns and warts, and in common use, mixed with cream, for inflamed eyes. *C. Rodgers, of Leominster, in Pharmaceutical Journal.*

## Calendar of Operations.

*(For the ensuing week.)*

PLANT DEPARTMENT.

Many Australian and other plants, which have been set in the open air during summer, but which were thought too hardy to be put under cover in the early part of the month, should now be removed to favourable situations under glass, and there placed as near the light as possible, as the process of ripening goes on much faster than in the open air, while the plants may be protected from our cold autumnal rains. They should, however, have the advantage of a free circulation of air, which should continue night and day, unless the weather is very cold. Oranges standing in the open air should be removed into their winter quarters during the next week, in most parts of England; and as all other greenhouse plants must soon be housed, the necessary preparatory arrangements should be immediately completed. The climbers in the roofs of the houses should be considerably reduced in bulk, reserving a proper selection of shoots for late autumn flowering, and for adequately furnishing the roof next summer. In addition to this means of admitting the light more freely into the house, let the glass be washed, that the plants may have every chance. Let the Geraniums which have commenced growing again, after being cut down, be shaken out and repotted into smaller pots. Be careful to set them where they will have plenty of light and air, so as to keep them dwarf and bushy; and do not give them much water until the pots have become pretty full of roots, when another shift will be necessary. Promote the growth of Gesnera zebrina, Achimenes picta and cupreata, by a strong bottom heat, with a moderate top heat; do not allow the latter to be excessive, or the leaves will be less hardy in their constitution, less durable, and less useful in the decoration of drawing-rooms and conservatories, for which purpose these beautiful plants are admirably adapted. As the Japan Lilies go out of flower, let the pots be laid on their sides for a week or two, in a sunny situation; after which they must be repotted in sandy loam and a little peat, and plunged in a bed of ashes in an open situation. These plants require a very short period of rest; but although the roots are active during winter, the plants should be kept in a cool place until spring, when a few for early flowering may be placed in the greenhouse.

FORCING DEPARTMENT.

Melons and Cucumbers must now have careful attention to continue them in a fruitful state as long as possible. Water judiciously, selecting fine mornings for the purpose; endeavour to keep the pits perfectly clean and wholesome, by admitting at all times sufficient air to ensure a circulation, and let the walls be occasionally washed with lime and sulphur to destroy insects. It is indispensable to keep up a good temperature, top and bottom; and if no better means are at command, this must be effected by dung linings, and by covering with mats and shutters at night. Young Cucumbers for winter forcing, recently planted, should not be stopped until they have reached the top of the trellis, when the point should be pinched out to induce the formation of lateral shoots. Do not allow the plants to be weakened by producing clusters of male blossoms. Give sufficient heat and moisture to induce a vigorous growth, but accompanied by a free circulation of air to ensure a sturdiness of habit; to this end also let the glass be kept perfectly clean, that they may have all the light possible at this season. After planting, a slight shade is necessary for a short period during strong sunshine, but they must be quickly inured to full exposure. Where dung linings are used for forcing pits of any description, means should be taken to secure them from the autumn rains, which check fermentation, and cause the heat to decline at a time

when it is most wanted; this evil involves a continual turning and renewal of the linings. In constructing a frame, in which fermenting material is to be employed as the heating medium, the front wall-plate should never be more than 12 or 15 inches above the level of the path; as by this means it is kept warm with a smaller quantity of fermenting material, and, at the same time, it gives the facility of covering the trenches with wooden shutters, suspended on hinges from the outside wall by one edge, and resting by the other on the wall of the trench. These shutters should be fixed with just sufficient incline to carry off the wet, and they should be made strong enough to serve as a gangway.

### FLOWER GARDEN AND SHRUBBERIES.

The work of this department, though entirely of a routine character, must be strictly attended to at this season, as neglect or untidiness never shows more strikingly than when the flowers which attracted attention in summer have disappeared. Remove annuals and other herbaceous half-hardy plants as soon as they show signs of approaching decay, and let others of more hardy constitution be divested of their decaying flowers and flower stems. Beds for Hyacinths, Tulips, and other early spring-flowering bulbs, should be prepared and planted immediately. They grow and flower in the greatest perfection when planted in a light sandy loam, which has received a liberal dressing of thoroughly decomposed manure; but which should be carefully kept from coming in contact with the bulbs, by placing a little sand round them at the time of planting. As the roots of these bulbs descend deeply into the ground, a good stratum of rich manure should be trenched in about 12 or 15 inches below the surface. In planting Crocus or other bulbs which are liable to be attacked by mice in winter, a little chopped Furze should be placed around them. If the beds where Crocuses are intended to be planted are still full of gay flowering plants, it will be better to plant the Crocuses in a spare bed in the reserve garden, in light sandy soil, where they will root freely, and be ready to remove with nice balls of soil when the summer occupants of the flower-beds are cleared away. Those bulbs left in the soil all the year round commence rooting in July, which is the cause of their flowering so much better than those which are planted late in the season.

### FLORISTS' FLOWERS.

It will sometimes occur, especially in fine autumns, that Auriculas will put up premature heads of flowers. We have known valuable varieties ruined by these trusses being plucked out inconsiderately; the result has been that the lower part of the stem has decayed, communicating its rottenness to the heart of the plant, and thus causing its destruction. The better way is to pull the pips off only. See directly to the offsets of Tulips, and let them be got in without delay. Gather Carnation and Picotee seed when the pods have turned brown; place the pods six or seven together, with a portion of the stalk attached; tie in a small bunch, and insert them in a little silver or other light paper bag; tie the mouth of the bag round the stems, and hang up in an airy place till you wish to rub the seed out for sowing. Dahlias, &c., as last week.

### KITCHEN GARDEN.

Pay particular attention to young crops, by stimulating their growth where necessary, and guarding them from the attacks of insects, by sprinkling a little soot and lime round them. As a general preventive, which is always better than a cure, it is a good plan to work a dressing of soot into the ground, in company with animal or vegetable manure, when the operations of digging, forking, or trenching, are going on. In cleaning the ground, use the fork as much as possible, in preference to the hoe and rake; nothing can be of greater benefit to crops at this season than affording the sun and air every facility for penetrating and permeating the soil. Continue the use of strong liquid manure to such crops as can profit by it; and especially Asparagus, to compensate, in some measure, for the present draught upon its energies by the seeds. Winter Spinach should be thinned out to a distance of 8 to 12 inches apart in the rows; and Parsley should have plenty of space to form fine broad leaves. In both cases, the ground should be well forked between the plants. Sow plenty of Normandy and American Cress, to stand the winter. If the earthing up of the Cardoon be deferred until the middle of October, it will keep sound till March; and as it does not grow much after being earthed, it is well to defer it as long as the plants are safe from frost. Where haybands are used for binding round them, they should be prepared in wet weather, when the men cannot work outside.

State of the Weather near London, for the week ending Sept. 25, 1851, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 29th, 1832—therm. 79 deg.; and the lowest on the 3d, 1836—therm. 29 deg.

## Notices to Correspondents.

ASPHALTE WALKS: *Lumbricus.* See p. 501 of the current year's volume.‡

BIRDS—THE MOCKING BIRD: *C W H.* As you so frankly ask our opinion of this bird, and whether we advise you to adopt one in your family, we at once say "No!" Mr. Clifford reports the value of such a one as he can recommend, at 5*l.* For this princely sum, you may have fine *song* birds in every room of your house. If, however, you *prefer* unceasing noise and perpetual uproar to harmony and melody, you can yourself give the casting vote. For ourselves, we hold *all* these foreign screeching animals in the most perfect abhorrence; and would gladly sacrifice 20 even of the most costly (if we had them) of the tribe, in exchange for a single canary. *Mais chacun à son goût. W. K.*—THE BULLFINCH: *H B.* We are much indebted to you for writing so long, so full, and so interesting an account of the tricks, manners, habits, and peculiarities of your little winged friend. As you have authenticated the anecdotes, we shall avail ourselves hereafter, whilst annotating on "the bullfinch," of the information so kindly given. The reason of his avoiding the palm of your hand, and refusing to sit on your finger, is his innate timidity. You must overcome this by gentleness, and by never attempting suddenly to catch him. Confidence will spring up, by and by, between you; and you must not abuse it. All is progressing well. Discontinue the use of the bath, henceforward. The food you administer is quite proper; and the Plantain is unobjectionable, so long as he will eat it. Disabuse your mind of the idea that *you* can teach him to "sing." If you were to purchase 20 instruments, and try them *all*, it would be labour thrown away. These matters are conducted in Germany; not in England. We shall explain all about it, in a very few weeks. In conclusion, be sparing of your hemp seed, and keep your bird warm in winter. *W. K.*—THE GREY LINNET: *Eliza C.* A hopeless case. The poor little creature should be killed immediately. *W. K.*—THE BLACKBIRD: *Amelia R.* Nestling birds are *not* the best, though they are oftentimes the tamest. A bat-folded blackbird, who has the true wild note, is far preferable to the other, who sings what is technically termed "rubbish." *W. K.*—THE GOLDFINCH: *Jane W.* Take a pair of long, sharp scissors, and carefully, but resolutely, cut the projecting part of the beak, until the lower and upper portions are equal. There will be no infliction of pain whatever. *W. K.*—THE MISSEL THRUSH: *Anne T.* This is a very handsome bird truly; but we recommend in preference the "song thrush." It is smaller, but its notes are far more sweetly-musical. *W. K.*—THE GREENFINCH: *E Z.* Not worth the cost of his food. Be "generous" to some "friend," and beg their acceptance of him! *W. K.*—THE REDPOLE: *Susanna.* A merry, lively, and pretty little fellow in a cage; but of no rateable value. *W. K.*—THE NIGHTINGALE, &c.: *J H.* The address you require is, "24, Great St. Andrew-street, Holborn." You may safely make your wants known, and may rely on being well used. If you purchase one or both the birds mentioned in your note, be sure and read carefully the "Treatises" we have penned, as to their care and management. *W. K.*—THE BLACK-CAP: *J C Ewan.* You need entertain no fear about the well-being of your little friend. Whether he resides with you in Lancashire or at the "Land's-end," it is all the same to him; "provided always," as the lawyers say, he is kindly treated, and considered "one of the family." Follow our instructions fully, and you cannot go wrong. *W. K.*—*Miss B.* Thanks for your note. We are over-paid by the kind manner in which you express your gratitude for the little service rendered. We mark and admire your good sense in not feeling offended at the rule laid down for our general guidance hereafter. *W. K.*—VIRGINIAN NIGHTINGALE: *H T.* We are obliged by your favour, and shall anxiously await the promised information. Your request, meantime, shall be complied with. *W. K.*—THE CANARY: *Amanda.* Your case is a trying one; and your excess of grief, natural to so sensitive a disposition. As a skilful surgeon uses the knife unsparingly when circumstances demand it, you, too, must take equally prompt measures. *Burn* the cage instantly, and procure *a new one.* Sulphur, unguents, tobacco-water, and the like, are *totally useless*, as we have stated times out of number. Where these blood-sucking vermin abound, nothing short of annihilation can work a radical cure. If you have faith to credit this, and will act at once as we advise, your "pet" will be restored to you—*not otherwise.* When in his new habitation, examine his little person carefully and minutely; rout the enemy from their lurking places with the back of a fine needle; and before letting him settle down, give him, for an hour or two, the free range of your sitting-room; also the use of the bath. This done, we shall expect to hear of another addition to our "list of cures." *W. K.*

BOOKS: *Rural Dean.* You will not find any book that contains many figures of florist's flowers. The periodical called "Beck's Florist" has good figures of some of the novelties in this way, and it will probably meet your wants. In general the representations of these things are more calculated to mislead than to instruct.

CLIANTHUS PUNICEUS: *W S.* It has no common name. You may call it the scarlet Clianth if you please.

FILBERTS: *W S.* In order to keep these for a considerable time, they should be throughly dried, packed in dry casks or new flower-pots, with a slight sprinkling of salt, to prevent mouldiness, and then placed in a dry cool situation. The husks should be allowed to remain on them.‡

FRUIT ROOM: *A Subscriber.* Winter fruit keeps much better in the dark than if exposed to the light, because light produces evaporation and consequently shrivelling, besides inducing chemical changes which end in decay. It should be ventilated, so far as to keep it sweet and to carry off the dampness produced by the natural sweating of fruit, and for this purpose your air-openings ought to suffice.

FRUIT TREES: *J A M.* Your old Peach trees may have been allowed to overbear themselves; and this, with the injury done to the foliage by insects, may have rendered them subsequently unproductive. But your next set of trees grew vigorously; and, of course, the branches would form so many naked stems, almost to their extremities, unless they had been cut back to where shoots were required to furnish the lower part of the tree. It appears that these trees are done away with; but recollect, that the next you plant will behave in the same manner, if not prevented by judicious pruning. They must be cut back in winter, so as to furnish the lower part of the wall. Shoots that are likely to become over-luxuriant, must have their tops cut back to a lateral, and nail or otherwise fasten them to the wall, before the weaker shoots are fastened. Your soil is, doubtless, naturally good and strong; and, therefore, with regard to all your fruit trees, you must use the utmost vigilance, in early and frequently checking in summer the strongest shoots, commencing with the uppermost. Not knowing the exact aspects of your walls, we cannot state what sorts should be planted.‖

GIDNEY'S HOE: We have had this tool tried fairly; its plan is a good one, but the tool is much too slightly made—the shank has no sufficient strength; and upon the whole, as delivered to us, is only fit for light land. It should be improved.

HASHISH: *Mathew.* This is a preparation from the common Hemp plant. It is not sold in this country, being an intoxicating drug, used only by eastern nations. Enquire of the Pharmaceutical Society, where you may no doubt see it. Also look in the Indian department of the Crystal Palace, where you will see what Hemp is like in India. The drug cannot be prepared from Hemp grown in this cold climate.

HEATING: *H S W.* There is nothing so cheap as flues, which are all you want.

HOTHOUSES: *C R W.* Why not apply to the firm in the King's-road, as you have been advised? You cannot do better.

INSECTS: *M C W.* The insect which has attacked your Pinks is the true wireworm. Pull up carefully every plant as soon as it droops, and search for and kill the worm, and also bury in the bed some slices of Turnip, which must be examined every morning, the insects preferring this to the Pinks. *W.—C M.* The Beech bark should be scoured with a hard brush and thick soapsuds mixed with lime. If not, the young larvæ, which are now being hatched by thousands, will attack the young shoots of the tree. Thanks for the Laburnum leaves. *W.—R V K* Your Oats are infested with the Aphis Avenæ, an insect allied to the green-fly of the Roses. They injure the grain by sucking out its juices. *W.—R.* The larva which has gnawed your Carrots is that of one of the smaller species of *swift* moths (most probably Hepialus fuscus), which are in general underground feeders, and against which nothing but vigilance and traps of sliced Turnips or Potatoes will prevail. *W.—M A S F.* The Pinus austriaca is attacked by the caterpillars of the Pine sawfly (Lophyrus Pini or Frutetorum). The branches attacked should be beaten sharply with a thick stick, a white cloth being placed under the tree to catch the caterpillars. This should be done at once, or they will change to pupæ in the moss and dry leaves at the root of the trees, which ought in such case to be removed and burnt. *W.—A K.* The Salsify leaves appear to be attacked by some species of Uredo. The Celery leaves are infested with the mining larvæ of a two-winged fly (Tephritis onopordinis), and others seem to have been infested by an Aphis. The withered leaves should be cut off and burnt. *W.*

KEW: *English.* In our opinion, your complaint is, upon the whole, unreasonable. Why did you not provide yourself with the guide when you first entered the garden? You should have known that a place like Kew, of such intricacy and extent, requires a map as much as a town. Write to Sir Wm. Hooker, make your suggestions, and we will answer for his attending to such of them as are reasonable.

MONSTROUS PEARS: *C Hewson.* They are very curious things. We will take an opportunity of referring to them hereafter.

NAMES OF FRUITS: *Rudolf.* 4, New Rock Pippin; 6, 11, Scarlet Crofton; 21, Golden Pippin; 14, 45, Rymer; 33, Male Carle; 44, Bedfordshire Foundling; 42, Shropshire Damson. The two Pears are small and imperfect; 34 B, is probably Beurré de Capiaumont. The remainder of the Apples are yet too green.‖—*J A.* The Early Harvest Apple.‖

NAMES OF PLANTS: *L R.* 1, Not determinable; 2, Pyrus arbutifolia; 3, Rosa bracteata; 4, Looks like a morsel of Pomegranate; 5, Leycesteria formosa.—*C A.* 1, 2, 3, and 8, Asplenium Adiantum-nigrum; 4, Lastrea dilatata; 5, Asplenium Filix-fœmina; 6, Polystichum lobatum; 7, P. aculeatum. *S.—D H B.* 2 and 3, Polystichum aculeatum; 4, Cystopteris angustata; 5, too small—send it in fructification; 6, Asplenium viride; 7, A. Filix-fœmina. *S.—L B.* If you will send your address we will communicate with you respecting the Fern in question. *S.—B W G.* Pavia lutea. Propagate it by grafting on the Horse-Chestnut; or better, by seeds.—*D.* You will find that the Oak in question has been named at p. 488.—*E J T.* Polystichum lobatum: very common, and quite distinct from any form of Lastrea dilatata. *S.—C A.* Your weed from the bottom of the Thames is not a plant at all, but a fresh-water sponge, with a most atrocious odour. — *T D.* Apparently Pentstemon cordifolius; but we really cannot give names to plants unless the senders will take some little pains to pack them, so that they will arrive in an examinable state.—*A Lady of Devonshire.* Marchantia polymorpha from a wet place, creeping among Moss.—*V W.* Viburnum Lentago and Erica stricta of nurseries; the wild plant has no flowers, and is undeterminable.—*A Scott.* If your plant is not a variety of Diplacus glutinosus it is new.—*M N.* Some Nicotiana in a starved state; perhaps a morsel of N. paniculata. Its seed has accidentally dropped into the mould.—*P B.* Chysis aurea.—*A Lover of Plants.* Indeterminable; *ruined by being packed in cotton wool;* we don't recognise it.

PARTRIDGES: *Micklewell.* Much obliged; 4.

POTATOES: *F Sommer.* The Kelso Eclipse is a very good mealy kind; but it is dark purple, like the old Aberdeen Reds, and these have been so universally blighted here in the south, that they are rarely cultivated, notwithstanding their excellence. In 1845 workmen would not dig them for the sake of the crop.

ROSES: *Temple.* The branches are attacked by white mildew, for which there is now no remedy. Early in the year washing with flower of sulphur mixed with water has proved beneficial. It will go off, but reappear next year towards the autumn. It is not very important.—*A B A J.* Your leaves are suffering from what will one day, we trust, be felt by yourself—old age. They will be succeeded by healthy young leaves when next spring returns.

SILVER FIRS: *J W R* Your tree is attacked by the Hylurgus piniperda, a black beetle that resides in the ends of the young shoots, where he constructs a gallery, and feasts on the tender tissue. You may see the ends of his gallery where the dead pieces are broken off. It is almost impossible to destroy him if he once takes possession of a tree. The best course is to watch the branches in the early summer, and wherever the tips become brown or yellow to break them off and burn them. In that way the insect perishes also.

TREE ROSES: *Eliza G.* There is no reason why the Rose-trees should be unfit for planting, provided they have made good growth this year, and provided also their heads are of the cultivated kinds. But if you mean to say that the trees are fine wild stocks, having "dormant buds" inserted among the branches, then we advise you not to purchase until the dormant shall have been roused into growth for a year. You will see by this answer that we are unfortunate enough not to understand your question certainly.

MISC.: *L L.* It is not uncommon for the Robinia viscosa to have a double blow, in June or July and September, provided the season is long and dry, like the present. Many plants have this year blo med twice; Wistaria sinensis, for instance, unusually well.—*J Kenney.* It was a very good green-fleshed Melon.—*J Welch.* The great conservatory at Chatsworth is constructed of wood. Mr. Chance, of Birmingham, furnished the glass. The other question we are unable to answer.—*S S.* The seeds will grow; one of them *is* growing. The seedlings will flower in six or seven years, if you treat them well.— *M B.* We cannot answer such questions.—*A Country Subscriber.* Mandevilla strikes readily from cuttings in a gentle bottom heat. The climber is Boussingaultia baselloides; give it plenty of room and sun and air. Starve your Fig and it will fruit. The Loquat is common enough, but will not fruit in England in the open air. You must have patience with your Elæagnus; cramp its roots and give it plenty of sun and air.

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS, AS THE ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Clover Manure, per ton ... ... ... ... | £11 | 0 | 0 |
| Turnip Manure, do. ... ... ... ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per ton, in dock. Sulphate of Ammonia, &c.

THE LONDON MANURE COMPANY beg to offer PERUVIAN GUANO, warranted perfectly genuine; Superphosphate of Lime, Wheat Manure, Concentrated Urate, Irish Peat Charcoal, Gypsum, Nitrate of Soda, and every artificial Manure, on the best terms. Also a constant supply of Salt for Agricultural purposes, at a low rate. English and Foreign Linseed Cake, Rape Cake, &c.

EDWARD PURSER, Secretary, Bridge-street, Blackfriars.

ARTIFICIAL MANURES.—Private instructions in Chemical Analysis and the most approved methods of making Artificial Manures are given by J. C. NESBIT, F.C.S., F.G.S., at the Laboratories, Scientific School, 38, Kennington-lane, London.

Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

TO AGRICULTURISTS.—All applications for Dr. S. NEWINGTON'S Patent Hand and Horse Dibbles, Drills, Cultivators, &c., must be made, only, to Mr. GABRIEL, Surrey Chambers, Arundel-street, Strand, London.

Dr. S. NEWINGTON'S Lecture on Seeding may be had gratis.

BALLINASLOE GREAT SHEEP AND HORSE FAIR, Oct. 4, 6, 8, and 9.

The railway is NOW OPEN from DUBLIN to BALLINASLOE. Through fares, via Chester and Holyhead (including steam-boat fare:—

| From | Single Fares. 1st Class. | 2nd Class. | Return Tickets. 1st Class. | 2nd Class. |
|---|---|---|---|---|
| London ... | ... £3 13 | ... £2 11 | ..... £5 10 | ... £3 17 |
| Birmingham | ... 2 14 | ... 2 0 | ..... 4 4 | ... 3 0 |
| Manchester | ... 2 0 | ... 1 12 | ..... 3 0 | ... 2 8 |
| Liverpool or Chester | 1 15 | ... 1 7 | ..... 2 14 | ... 2 2 |

The London return tickets are available for 14 days after date of issue. Between the others stations for seven days.

Time of journey from London to Ballinasloe, by Express Trains, 18 hours. Departures from Euston Station:—9·30 a.m. Express; 5·0 p.m. Express; 8·45 p.m. Mail.

DURABLE OUT-DOOR PAINT.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the Nobility, Gentry, and Clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Wood, Iron, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice. Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON and SON, No. 9, Great Winchester-street, Old Broad-street, Royal Exchange, London. No Agents.—All orders are particularly requested to be sent direct.

FOR WATERING GARDENS, DISTRIBUTING LIQUID MANURE, BREWERS' USE, &c.

PATENT VULCANISED INDIA-RUBBER HOSE-PIPES AND FLEXIBLE GAS TUBING.

JAMES LYNE HANCOCK (sole Licensee and) Manufacturer, Goswell Road, London.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, for portable Gas Lamps, and all purposes where a perfectly sound Water-proof and Flexible Pipe is required. Hot Liquors or Acids do not injure them; they are, therefore, much used for Chemical purposes, as they require no oil or dressing when out of use; are particularly suitable for Fire Engines, and are found exceedingly useful in Dwelling-houses for conveying Hot or Cold Water to Baths, &c.

Testimonials and prices may be had on application to the Manufactory.

N.B.—Vulcanised India Rubber Garden Hose, fitted up with Roses, Jets, and Branches complete, with union joints ready to attach to pumps or water cisterns.

All Letters or Orders addressed to J. L. HANCOCK, Goswell Mews, Goswell Road, London, will meet with immediate attention.

Waterproof Fishing Boots and Stockings, Portable India-Rubber Boats, Shower and Sponging Baths, Air Cushions and Beds, made all sizes to order.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description; but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected on the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL AND Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of

THE ASPHALTED FELT FOR ROOFING

Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are

F. M'NEILL AND CO.'S

Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where Roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance of Westminster Hall, were roofed with F. M'NEILL and Co's Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

The Agricultural Gazette.

*SATURDAY, SEPTEMBER 27, 1851.*

MEETINGS FOR THE TWO FOLLOWING WEEKS.
THURSDAY, Oct. 2—Agricultural Imp. Soc. of Ireland.
THURSDAY, — 9—Agricultural Imp. Soc. of Ireland.

CAN the British labourer in the purely agricultural districts live without parish support? And if so, in what degree of comfort? And is his condition retrograding or progressing? These questions are interesting, and yet they admit of no definite solution, as differences in the scale of payment in agricultural districts are so perceptible, and not very easily accounted for—local burdens, imperial taxation, and prices remaining the same. The English workman cannot say with the Persian maid, "East, west, north, south, I care not whither;" as the lot of the northern and that of the southern, if not wide "as the poles asunder," is at least very different. Anxious to ascertain by actual observation if the agricultural labourers in the northern counties be in decidedly better circumstances than those in the midland and southern, and to what causes the difference, if real, may be attributable, we have noted in the first place some of the results of our inquiries as to the present rates of labour in a few of the principal agricultural counties; they are as follows.

In a great portion of Berkshire, and the adjacent counties, the regular wages are, harvest time excepted:

| | | s. | d. | | s. | d. |
|---|---|---|---|---|---|---|
| Men, at ordinary work, ... | per week | 6s. | 0d. | to 8 | 0 | |
| Boys, 10 to 12 years old, tending pigs, &c. | do. | ..... | | 1 | 6 | |
| Carter ... | do. | ..... | | 8 | 0 | |
| Reaping or fagging Wheat, per acre ... | | 7s. | 0d. | to 8 | 0 | |
| Mowing Barley and Oats do. ... | | 2s. | 6d. | to 3 | 0 | |
| Reaping do. do. ... | | 6s. | 0d. | to 8 | 0 | |
| Women* per week ... | | ..... | | 4 | 8 | |

The rents of cottages are about 1s. 6d. a week, and coals (in Berks) usually cost 1s. 2d. per cwt. With these wages and charges, the labourers are in poor circumstances, except in harvest, unless their families be small, or they have grown-up sons and daughters to earn wages for their joint benefit. Indeed, as to the labour of the sons, so little do these regard the spirit of the fifth commandment, that they usually spend exclusively on themselves, when grown up, the whole of their earnings, contributing nothing to the support of the family, except providing their own food, and eating it in selfish solitude under the domestic roof, while they "honour" their parents so far as to occupy a bed at their inconvenience.

Dorsetshire used to be rated as the lowest, perhaps, in regard of the labourer's condition, but we believe that the distinction between it and the other counties under our immediate observation is inappreciable. Meat is a luxury rarely indulged in by the purely agricultural labourers, who have families of young children; and were it not that they make their own bread, and thereby cheapen the already low-priced loaf, they would find it very difficult to subsist on the balance which remains to them, after paying their rent and providing fuel.

Going northward of London, and regretting that we have not opportunities of making notes respecting the labourers' condition in Northamptonshire, where outward appearances appeared to us indicative of solid comforts, we pass on to the less favoured counties of Huntingdon and Cambridge, where we find the rates of labour to be nearly the same as those in the southern counties, and the prospect of further diminution greater in the districts in which the inferiority of the soil and neglect or difficulty of complete drainage renders tillage impracticable (in point of economy) under the existing depreciation of agricultural produce in general. Farms that are dear at from 10s. to 15s. an acre, we may conclude to be intrinsically of value only for grazing, and, therefore, incapable of supplying remunerating employment to the peasant, who, in fact, is thrown out of work wherever grazing is pursued as a system. Even in the immediate vicinity of Cambridge the privations of the labourer are great, and poor rates (the barometrical test of local condition) frequently very high. But let us advance to Lincolnshire, where there is a different state of things.

If unmarried, and domesticated in the farmer's house, 10l. a year, with abundant diet, bacon three times a day, if he has stomach for it.)

A female farm servant receives 14l. a year, and a shepherd (with diet during the lambing season), 22l. a year, with Grass and fodder for a cow, a house, garden, and a ton of coals drawn home for him by his employer; which are much higher rates than those in the other counties. In Lincolnshire, broth and bacon are used by the labourers three or four times a week.

Such are the rates, whether in the wolds, the marshes, or the fens of this fertile county. Mr. WINGATE, of Harsby, near the very neat and thriving town of Spilsby, who is partly proprietor, and partly tenant of 2000 acres of wold and fen, or marsh land, pays these wages, as also do the farmers generally, whether of the upland or lowland districts. The rents are from 1l. to 1l. 5s. per acre, on the chalky wolds; and on the fertile alluvial low lands, from 2l. 5s. to 3l. an acre; and the labourers have ample means of living in full comfort, unless (which is sometimes the case in winter), they have not full employment. Those on Lord WILLOUGHBY's estate, at and near Spilsby and Hundleby, have the privilege of occupying allotments of excellent land, at the rate of 2l. an acre. There are, on numerous properties, new and neat cottages moderately rented; and the women (who perform little work out of doors, excepting the assistance they afford to their male relations in reaping and binding corn) are very neat housewives, and find employment enough in making and mending clothes, keeping the house scrupulously clean, and preparing dough for them, which is baked in the baker's ovens at 1d. per stone of flour.

Straws show how the wind blows: and even such a trifle as the manner of gleaning corn in Lincolnshire illustrates, in some degree, the principle of this saying; and exhibits the greater independency of the labouring class.

We have no where seen such a vast extent of fine arable and grazing land, or more marked evidences of a wealthy proprietary and tenantry than there is in Lincolnshire; that picturesqueness of landscape to which we are accustomed may be wanting, but the crops of corn are more luxuriant and heavy on plains of apparently unlimited extent, with little loss from fences, and the neatness of culture strikes the eye. The drainage of the fens and marshes has been, indeed, a wondrous work, and enormously repaid by the acquisition of a deep inexhaustible soil, with marl and silt underneath in many places, and when under Grass, capable of fattening an ox and three heavy sheep to the acre. From 100l. to 120l. has been the price hitherto paid for the purchase of marsh land per acre: but can this price continue, and will even the Lincolnshire farmer be able to employ labourers in future at the present terms, with an average yield of crops? This year is a standard. *He* says no! The tenant farmer, who receives a reduction of 10 per cent. on his rent, declares that he is spending his capital, though he manfully holds on his course of tillage without *as yet* reducing his labourer's wages. If any British agriculturist can weather the storm of the day, it

* For dibbling Beans, they are paid by the gallon of seed sown, and may earn from 1s. 6d. to 2s. a-day.

must be such an one as the owner or occupier of the rich grazing farms of Lincolnshire—combining some tillage with much grazing. He cannot but realise a fair profit while the general prosperity of the kingdom continues to insure numerous consumers of beef and mutton, and butter (producing 12*d.* per lb.), on both sides of their bread. We found a higher price than this for fresh butter in the Boston market, where a remarkably well dressed and respectable looking assemblage of farmers' servants and market-women was disposing of their dairy and poultry-yard produce at decidedly remunerating prices.

In West Cumberland the wages of labourers are at least as high as in Lincoln, and there they enjoy the great boon of very cheap coals. Farm offices are springing up, with due regard to the manure tank system, and bearing out Sir JAMES GRAHAM's declaration, that there are competitors enough for any vacated farm. The labourers there are among the best in circumstances in England. How can it be otherwise, when they usually receive 10*s.* a week, with hardly any expense for coals, and bread on such cheap terms! It is curious that farm wages are now so much higher in the north than in the south of England, though the contrary was the fact 200 years ago. Mr. MACAULAY states that at that period Wheat was 70*s.* a quarter, and labourers earned only 7*s.* in summer, and 6*s.* in winter in the southern counties, and less in the north. The labourer in the north and north-west of England is now certainly as well off in every respect as those of his class have ever been.

The competition for labour in those counties where neither manufactures nor mining (as in West Cumberland) afford employment, will, as far as we can judge, continue, without probability of greater encouragement to the midland and southern farmer to employ labourers. "What is your secret?"—we asked of a West Cumberland gentleman, engaged both in agriculture and commerce. "My secret," he replied, "is, not to waste manures; I buy inferior and damaged Indian Corn and Rice for my pigs; and I sell my best Barley and Oats. Bacon pays me well. Foreigners will send us Wheat in preference to Oats—and I now grow Oats accordingly, which this year are paying well."

We know how the miser saved his starving horse from death—by "trying Oats." We shall do the same ourselves if we can; but *this*, however it might answer as a particular specific for one tenant farmer, cannot be looked upon as a general remedy, or at all calculated to improve the lot of the labourer. We cannot see any immediate prospect of alleviation in his condition, and we should regret to find a *forced* flow of emigration from England become as necessary as it appears to be in Ireland, where the able-bodied peasants are leaving their homes in hundreds of thousands. *M. D.*

## MANURES: CONCENTRATION OR DISTRIBUTION?

IN the *Agricultural Gazette*, of the 14th June last, attention is called under the above heading to the action of manures; and, if it is not matter of indifference how manure is deposited, and we cannot think it is, we owe thanks to Mr. Charles Lawrence for calling attention to the subject, and I did hope his appeal would have awakened more than, by the silence with which it has been received, it appears to have done. I must think it one well worthy of discussion, and of experiment, too, in which latter it appears to have been altogether neglected. Possibly the mode of application should be ruled by the object with which manure is applied; if to promote the rapid and large development of the plant in its first stage of growth, then the concentration will be found of great value, as in that of superphosphate of lime, bones, and dung in the Turnip-drills; but as all roots descend in the ground, almost immediately after the production of their first leaves, to a greater depth than we can suppose the influence of the fresh applied manure to extend, the manure thus concentrated, except in the immediate short lateral fibres, must very soon cease to be operative in the farther development of the plant; and it then lies an inert mass, until distributed through the soil in future tillage, after the removal of the crop. It is a very great error to suppose the concentration of manure will restrain the roots of plants from extending into unmanured space; it is a rule of Nature that they should so extend, they thus secure the stability of the superstructure of the plant, and the more regular and abundant supply of water, so essential to its very existence, that if withheld for a very short period it inevitably perishes. The roots of our cultivated plants, however, not only descend beyond the influence of the concentrated mass of manure, but at very early periods of their growth, beyond that of the manure which has become distributed through the active soil of our cultivation; their roots, either tap or fibrous, will, I believe, where insurmountable obstructions do not exist, or where excess of water does not prevail, generally be found to descend to a depth exceeding the height of the plants above the ground. Governed by this rule the lofty trees of the forest send down their roots to depths beyond what we can conceive to be the reach of aërial influences, and of the regions of organic food, into the magazines of crude inorganic matters.

By the experiments of Wade, we are taught that the dissolving action of water is not sufficient to extract from the aluminous particles of the soil the ammonia of their saturation, and we are thus taught to look for a more powerful elective attraction in the roots of plants; this appears to reside in the spongioles of their extremities. In the first growth of a plant, when its roots are small and few, this attraction, although sufficient for a development of leaf that will ensure the continuance of its kind, may not be, and is not found able to exert a force equal to that abnormal production which our cultivation requires; a mass of vegetable and animal matter, giving out an excess of ammonia over what the circumjacent clay can absorb, will, placed immediately in contact with the roots, give a supply of free ammoniacal and carbonaceous food as will enable the plant to put up an immense development of leaf, far exceeding what it could do were it depending on what its elective attraction could force from the embraces of the particles of clay with which its few weak and minute spongioles could come into contact; neither does a plant at this period of its growth require the inorganic matters of the soil. We see in impoverished soils how much, from this want of a free supply of food, the young plants suffer at the period of their growth when they have used up the food their seeds gave them: their leaves turn yellow, and some unfortunate insect is conjured up to account for this appearance, and for the gaps that starvation has caused. In my land, of its first year's occupation, by me, this is evidently seen—for years wretchedly tilled, unmanured, cold, and wet; nine-tenths of the seed I sowed in it perished; the plants came up so poor and weak as scarcely to be seen—they were starved in their infancy; yet such as survived, when their roots had extended, and had acquired strength and mouths to force from the clay and take in the organic matter it holds, show in their rankness that there is no deficiency of diffused manure.

The Irish are very fond of growing their Potatoes in beds, and contend the produce is greater than in drills, and I verily believe they are right on the average tillage; here the manure is distributed in a thin stratum over the whole bed, and, lying between two layers of clay, it acts upon a large surface of inorganic matters, converting them into soluble salts; and I have heard it contended that the land is even left more fertile than when the dung has been concentrated in drills, and the intervals comminuted by repeated workings. To the small farmer with a weak team, this plan of tillage, however unthinkingly condemned by would-be improvers of the day, has the advantage of a deeper tillage than he could effect under the drill practice, for he digs the furrows to the full depth of the surface-soil, and generally brings up some little of the subsoil. Yet I have had under peculiar tillage far heavier crops of Potatoes in rows than I have seen in beds. Still there are said to be instances, and not uncommon ones, of 12 tons being got from an acre of beds. But Potatoes do not require the same immediate action of manure that seeds do, for in the sets they contain a much larger amount of directly available food; indeed it is a practice that appears very successful, to plant the sets in the beds and not to manure them till they are coming above ground, when the manure is covered from the furrows; it is attended with an advantage in smothering the first growth of weeds, and really helps very much to their future cleanliness, for, with a second dressing of clay from the furrows, when they are breaking through the first, a second smothering takes place, and the growth of the plants then being very rapid, they cover the ground before the third growth of weeds acquire strength. In rich feeding grounds, it is common to grow, on breaking them up, two crops of Potatoes in succession, and three of Oats without manure, and then to leave them to get a coat of Grass again, which they soon do.

In Turnips, on the contrary, from the smallness of the seeds, the food of the young plants they contain is so soon exhausted, that an immediate supply of free organic pabulum is required, and this becomes still more necessary from the very fatal attacks of the fly in their first growth; the concentration of the dung, therefore, immediately beneath the seeds, appears advisable. Yet, as the young plant very soon sends down its roots to a greater depth than we can suppose the influence of this fresh application of concentrated manure to extend—a Turnip, when it attains its rough leaf, has pushed down its root nine or more inches—we must think it will tend to continue the quick growth which we have induced by concentration, to provide for its after food by manure more deeply distributed. I should think that, instead of leaving the farm-yard manure in a body in the drill, as is usual, and with the usual mode of using with it guano and superphosphate of lime, it would promote a large development of the Turnip to work the farm-yard manure into the drill to as great a depth, and to mix it with the undersoil as intimately as possible, so as to form with this soil a rich compost. In clay soils, where the bottoms of the drills are so much consolidated by the carriage of the manure, this breaking of them up must alone be advantageous, by facilitating the development of the root; and by this treatment longer manure may be applied, if it can be worked in, than where the immediate feeding of the seedling is intended. In Ireland, I must think, long or short dung is too indiscriminately applied to Turnips; and this is the more inexcusable, as the long dung seems best adapted to the Potato. Indeed, a correspondent of the *Irish Farmers' Gazette*, who farms very largely, recommends in clay soils the application of unreduced dung. On this subject Mr. Hunter says:—"The best kind of manure, for this subject, is rough farm-yard manure, in its first stage of decomposition; viz., fermentation half over. The more bulky it is to its weight, so much the better is it; for, by its gradual decomposition, the space which it occupied will become more vacant, and the surface soil will naturally sink therein, during which process the soil will be kept open by this imperceptible movement, through which the air will have free access, giving a benefit much to be desired in the raising of a Turnip crop." Mr. Hunter's opinion is deserving of attention, for he not only is an extensive grower of Turnips, but also succeeds in raising large unmissing crops off brick clay soils. Yet with due deference to this opinion, and however desirable it be to keep clay soils open, I think this bulky manure in the shallow drills he recommends would render the drills too dry; perhaps, however, in the dripping climate of Cork this may not be the case. Besides, as it is in the last stages of decomposition that manures supply their nutritious products to plants, the young Turnip in its first growth, when it most requires stimulants, would derive very little benefit from manure in its "first stage of decomposition." Liebig says "Ammonia is the last product of the putrefaction of animal bodies;" "Carbonic acid and water, and ammonia, are the final products of animal and vegetable matter." And again he says, "The nutriment of young plants consists of carbonic acid, contained in the soil in the form of humus, and of nitrogen in the form of ammonia."

The first development of plants, and their future abnormal growth, mainly depends on the earliest enlargement of the organs through which they imbibe their food, is then promoted by concentrating their nutriment within the reach of the young roots, while their after progress is better ensured by a distribution of our manures through the soil, which, in their extreme division will, aided by atmospheric influences, so act on the crude inorganic substances in the soil, as to supply them in greater abundance with matter in a state fit for assimilation, than they would be supplied with, were the action of the manure restricted to their narrow superficies which, placed in a concentrated line in drills, it would expose to the surrounding inorganic particles of the soil. *J. M. Goodiff, Granard.*

## POULTRY PILGRIMAGES.

[I. May 8, 1851.]

DITCHINGHAM PARK skirts the highway leading from Norwich to Bungay, at about two miles north of the latter town, which is just within the borders of Suffolk. It affords the most pleasing prospect which meets the eye of the traveller for many a mile. The first glance over the park-paling gives a hint that the place may have been laid out under the inspiration of the great Genius of Capability; the gentlemanly red-brick mansion, backed by evergreens, the unbroken woods of Elms and Oaks, the broad expanse of pasture sloping from them, and the handsome sheet of water which reposes at the bottom of the valley, bear witness to the historical fact that Brown was the artist here. And this much may be said of his performances, however closely they may be criticised, every one enjoys and admires them. The features that have just been described are visible from the high road, but the perfect point of view is at the hall door of the house. On looking forward, the most distant object is the handsome steeple of Ditchingham Church, rising above the woods, which are continued right and left to the very foreground on each side of the picture; between them is a bright sweep of undulating Grass, divided by what appears a respectable river. In the middle distance of the water is an island of about three-quarters of an acre, modelled on those in the Thames above Richmond. On this is a rustic fishing-house, just conspicuous enough to attract the eye to the right point. The island appears *a trifle* too large for the river which flows past it, but this disproportion will be removed by changing some of the large trees which stand on it for shrubs.

A merit in the Brownean landscapes to our eyes is that ornamental poultry and water fowl are found to give them the last finishing touch. A peacock strutting before one of Brown's mansions is felt to be as appropriate as the high-heeled shoes, silken sacks, and clipped hedges in one of Watteau's garden scenes, where a lady and gentleman are dancing a minuet to the music (which one does not regret being unable to hear), of a pipe and tabor. On the lake there must be swans of course, and besides them whatever water birds in wild plumage and half-familiar, half-independent habits can be induced to continue their residence within the park boundary. Farm-yard things are to be kept out from such scenery, as rigorously as errand-boys with parcels from the Royal Exchange. Mr. Bedingfield tried the experiment of turning some party-coloured tame ducks on his river, but they would not do at all. He formerly had musk ducks, but they avoided the water, and the cook having thrown out the heads of some eels that had been caught by hook, without taking the trouble either to remove the instruments of their capture, or to warn the musk ducks that swallowed them of the danger they incurred, there was soon an end of them. Besides swans and mallards, the great ornaments of the river now are bernicle geese. There is a pair of bean geese; but whatever may be the merits of this species, it has the

misfortune of being the ugliest of its genus. It is not without intrinsic good qualities, though it breeds less freely than most other captive Anserinæ. Mr. Edward Blyth writes us word from Calcutta, that what is said in the "Ornamental Poultry," of the white-fronted goose, applies equally to the bean goose, and also to the grey lag and the pink-footed. The bean goose may be equally amiable, but like Wilkes, it requires a good five-minutes' start in conversation to be placed on the same footing with individuals of average good looks.

On rowing to the island, we had the pleasure of seeing the nests of three pairs of bernicle geese. They were all placed just at the water's edge; their substratum was a slight collection of sticks and rushes, on which was laid a perfectly circular bed of grey down, in which lay the eggs. The quantity of down was so considerable that it looked as if both birds must have contributed to its formation; and there was no waste, no straggling edges, but all nicely packed together within a circumference just sufficient to contain the eggs comfortably. One nest contained five eggs; the other two, four each. From these 13 eggs Mr. Bedingfield hopes to have 10 or 12 goslings. When hatched, they are left entirely to the care of the parents; who are not themselves fed in any way, with corn, or otherwise, but subsist solely on what they find in the park. At about three days old they are caught and pinioned, and then turned adrift again. Otherwise they are apt to fly off, in hard weather, down to the river Waveney; and the chances are that they would cross Bungay Common, around which there are about as many guns as adult males, *once* only. The *facilis descensus* from Brown's river to that which forms the natural boundary between Norfolk and Suffolk, would have a classically *unfacile* return as its consequence. Mr. Bedingfield has no Canada geese now; they are terribly cross to other fowl, and powerful in their crossness. They are also extravagantly voracious. A pair of Canada geese eat nearly, if not quite, as much Grass as a cow. A pair of Brent geese here have not bred, more than elsewhere; but wigeon *have* bred in Ditchingham Park.

Although various poultry are kept on the farm, at the house Mr. Bedingfield adopts the judicious plan of having only one sort of fowl, which the reader will be surprised to hear are silk fowls. These have increased well, lay a sufficiency of eggs, and prove most docile sitters and nurses, both for their own young, and for pheasants and partridges. Some of the hens, I was assured, will submit to be placed on a nest of eggs that may happen to be found in the park, and will take to it at once, and hatch it off without further trouble. They are of course so posted while in the mind to sit. In the hatching boxes is a capital contrivance for preventing the escape of the sitter, and the intrusion of other hens. It is simply a horizontal slide across the opening, not broad enough to exclude air and light, though grosser things are refused admittance. The silk fowls are of the kind sometimes called Hong Kong Bantams, small, short-legged, but slightly furnished with wings and tail, and to my eye very pretty. People condemn a thing seen in a dealer's cage, or an exhibition pen, which they would delight in if they made its acquaintance at a country mansion. Silk fowls are not *show* birds; it was with a struggle that their name was admitted into the last Birmingham List, and this year they have to crow to the tune of "Oh, no, we never mention her!" They will probably be treated as intruders if they presume to present themselves for extra prizes among the "deserving specimens of ornamental poultry." Till the Cochin China epidemic has a little subsided (and the remedy of bleeding of the purse is being boldly practised on patients in the advanced stage of the complaint), the phœnix itself would be "pooh-shoo'd" into the back-ground, and refused all chance of one of Mr. Ottley's beautiful medals.

The silk fowls at Ditchingham have a slight lark-crest as well as comb. They are white, with red combs, yellow with red combs, and white with black or purple combs and skin. They have mostly slight down or feathers on the legs. From the commixture of these, speckled individuals have proceeded, but it is proposed to sort them forthwith. The eggs of the red ones are cream-coloured, of the others white. We do not quite acquiesce in the treatment which silk fowls have of late received from the public; and, therefore, as a great favour to our readers, a few words shall be added respecting them and other little-known fowls. The communications are from gentlemen whose mere names are sufficient to call attention to what they write.

The first is from Mr. Edward Blyth, Curator to the Asiatic Society's Museum, Calcutta. "I still adhere to my opinion respecting the derivation of all the domestic varieties of fowl, from the wild species common in the Bengal presidency and the countries to the E. and S. E. The question is much narrowed in many ways. First, the indigenous geographic range of all the large gallinaceous genera is much limited. Meleagris, for instance, to Africa; Phasianus (verus) to Middle Asia, from N. Persia to China and Japan; the golden and Amherst type to China; and so with Pavo, Polyplectron, Galloperdix, Tragopan, &c., all genera comprising a plurality of species. No grouse nor ptarmigan has its dwelling in the pine-forests, &c., on the snowy heights respectively of the Himalaya, nor, so far as known, on the Hindu Kosh or Altai, but are there severally represented by the Monal, the Tetraogallus, or snow pheasant, and the Serva, or snow partridge. So wild Gallus is restricted in its range to S. E. Asia and its islands (most of the larger), or the Asiatic region of the Monson. Ascending the Himalaya, it soon gives way to Gallophasis (vel Nycthemerus), and this in its turn to genuine Phasianus; but in peninsular India they are the sole representatives of the pheasant group.

"Next, we recognize two wild subgeneric types of Gallus, the Indian and the Malayan. The first resembles the ordinary domestic fowl in its comb and two lateral wattles, and the nuchal hackles; the other has a single throat-wattle, and no neck-hackles (of which I only know G. varius vel furcatus, and, from the figures, G. œneus). Of the first, or Indian type, I know three species, viz., G. Stanleyi (the hen of which is figured by Hardwicke), vel Lafayettii, which is peculiar to Ceylon, and at once completely distinguished from the common fowl by its red-edged yellow comb, and extremely different voice in every note uttered. Many Ceylon sportsmen call it the 'John Joyce,' from its sharply uttered dissyllabic crow, more analogus to the call of a partridge. The form of the comb is again distinctive, and so is that of Sonneratii. This second species is peculiar to S. India, from the Vindhyan mountains southward. The very peculiar plumage of the cock, and every note uttered by either sex, totally separate it from every domestic breed. I have found it, however, easy to render very tame, and Stanleyi also; both interbreeding most freely with picked domestic fowls, and the males quite as salacious as any domestic cock. A G. Sonneratii I had would attack any human intruder into the large aviary in which it was kept, and myself among the rest, and was a fair match for any domestic cock of its weight. A hybrid son of his was equally salacious, but unprolific, and so was a hybrid daughter, however either were matched. This hybrid hen laid many eggs that were all infertile, and so were all eggs that should have been vitalised by the hybrid cock. Lastly, the third Indian species inhabits all suitable districts of the Bengal presidency, with the Burmese countries, Malay peninsula, Java, and, I believe, Sumatra and Borneo; but Malayan specimens are deeper coloured, and so far as I have seen, all from the eastward of the Bay of Bengal want the conspicuous ornament of the pure white cheek lappet of the Bengal Jungle-fowl, in common with the Spanish domestic breed, &c.; and it is curious that this white cheek-lappet is excessively rare among the domestic cocks of Bengal; also, it is remarkable that the delicate mottling or pencilling of the hen's plumage, though common enough in English hens, is hardly ever to be met with in the domestic hens of Bengal. In the neighbouring (formerly Burmese) province of Arekan, many of the tame hens are scarcely distinguishable from the wild, and only by being a little coarser in the leg, with a tendency generally to greater development of comb; and these hens, hardly removed from the wild, are free breeders. Domestic cocks, of various breeds, may often be found to match, feather by feather, with the wild bird, even some of tolerably gigantic dimensions, of which I have had a specimen preserved: and the voice is absolutely that of an English game fowl: this is of importance, as the notes of the two other Indian species are so utterly different. The differences of voice among the races of domestic fowls are as nothing in comparison. Moreover, notwithstanding what you say, the wild hen signifies aloud, after the same fashion as the tame one, her deposition of an egg, and thus it is that the eggs are occasionally found, though not very commonly.

* * * * * *

"The wild common fowl (as I must persist in denominating it) is, in Bengal at least, much less so I believe in the Burmese and Malay countries, of much wilder and more irreclaimable nature than its congeners of S. India and Ceylon. It is a most difficult bird to keep in captivity for any length of time. I never but once succeeded, and that was with three cocks who got into fine condition, with their combs enlarged and erect, and pretty well lost their timidity; but I did wrong in keeping them (for want of better accommodation) together with a G. Sonneratii, who was 'cock of the walk,' and monopolised the two picked common hens; and when the rainy season came on, all three took ill, and died in the course of a few days, to my very considerable regret, as you may imagine. I have often heard of people keeping tame jungle fowls here, but, on inspection, always found them to be the very similar Arekan tame race, coarser-legged, and the male with red cheek-lappets; and I suspect these, and the Malayan bird (perhaps a corresponding tame race) are what have been hitherto taken home for G. bankivus. Some of these tame hens I have now by me for the future crossing with the different wild species. You may rest perfectly assured that there is no wild silky fowl, or feather-legged, or crested, or black-skinned, or gigantic, frizzled, &c.

* * * * * *

"I have not hitherto made the Asiatic breeds of fowls and pigeons much of a study, but will do so forthwith. I have seen no Indian tame fowls with so much of the Jungle-fowl character as the English game fowls. The Indian game cocks are heavy made, coarse-legged birds, with the arched nape of the Chittagong, and a pearly white eye. Cockfighting is in great esteem at all the Musselman courts. The great Chittagong breed is in high esteem for the table. The ordinary Bengal fowls are not large, and a black skin is common enough, with comb, wattles, &c., more or less completely melanised, but so far as I have seen only among females! I have often tried in vain to procure a black skinned cock. The growing chicks are commonly more or less nude, sometimes to a very great extent. These ordinary fowls vary exceedingly in colour, have single or double or complex combs, and more rarely a slight crest of feathers. When I have studied them more I shall be able to say more about them, but the breeding of all domestic animals is here utterly neglected. The feather-legged Burmese Bantams are a very beautiful spangled race; and the only silky fowls I have seen here (*i.e.* at Calcutta) were from China, or Malacca, or Singapore; the latter with single red comb and wattles, the former with complex rose comb (blackish, I think, and very short stubby beak) and a quantity of livid or glaucous blue skin in place of wattles, imparting a most remarkable appearance.

"Oct. 11, 1850.—The foregoing somewhat desultory remarks were written off *currente calamo*. This morning, as luck would have it, a friend dropped in to breakfast from a long journey, who was the man of all others I wished to consult about Indian tame fowls and pigeons. I have not only learned much from him already, but am proceeding with him systematically to work, to collect all the well-defined breeds we can, and this not only from different parts of India and its environs, but also of the Malay countries and China. Two breeds of fowls he mentions are quite new to me, viz., that of the Punjab and Sindh, and that of Affghanistan. The latter is a largely whiskered bird, with remarkably scale-like feathers. The former a moderately large fowl, carries the body very horizontally, and has the middle-tail feathers less arched than in other breeds; the gait also remarkably pheasant-like. These and numerous others I expect to procure ere long, and shall be happy to reciprocate with you in sending living birds."

The second bit of poultry news is from Mr. E. L. Layard, brother of the distinguished Ninevite discoverer. It is dated, Point Pedro, Jaffna, Ceylon; Oct. 30, 1850.

"The rumpless fowl is not a wild inhabitant of this island, in spite of Temminck. It is a rather rare tame introduction from Cochin, I am told. I am sure it is not found wild in these parts. It may appear like boasting, but I can confidently say I am more acquainted with the Ceylon Fauna than any man living, and that if the bird had existed wild, I must have seen it. Wallikikilli is the name for the female of Gallus Stanleyi (Gray), literally Walli Jungle, Kikilli hen. Kukulla is male, Kukullo plural. The name of the Rumpkin is Choci-Kukullo, literally Cochin fowls. The same name, with the addition of the word maha (large) is given to the large Malay breed. Our true jungle cock is a noble bird with fearful spurs, as I have good cause to remember. I trust you will see it some day in Lord Derby's collection. I have been very unlucky hitherto, not more than three having reached Calcutta alive. The hen is much smaller and very differently coloured; the egg is short, obtuse, weighty, and speckled like a turkey's somewhat.*

"The Friesland fowl, called caprikukullo, is found here but rarely; the natives say they came from Batavia originally. This agrees with Temminck.

"We have another beautiful bird which I think would domesticate. It is the Tetrao (Galloperdix) zeylonensis of Gmelin, or the Tetrao bicalcaratus of Pennant—Abankukulla of the Cingalese [a domesticable Tetrao is unique.] It is an inhabitant of the jungles of the *cold* mountainous interior. It is a bird of great 'pluck,' and its two spurs would make it a formidable antagonist. This also I am trying to send to Lord Derby.

"Lastly, the Kallu-mas-kukullo of the natives is, as the name implies, a fowl with *black flesh*: its bones are also black, and on table is a revolting looking dish. But taste it! No other fowl in this country can compare with it for juiciness and tenderness. I never saw this fowl in England; here it is abundant. The prevailing colour of the true breed resembles a white fowl drawn several times through a sooty chimney! the skin of the eye-wattles, legs—in fact all fleshy parts bearing the same *leaden* hues. It is little eaten by the Europeans, on account of its colour. I am, however, glad to get it on *my* table."

## A BULL-BREEDING FARM.

It may, in the first place, be as well to consider what kind of farm would be most suitable for a bull-breeding establishment. It should neither be too small nor too large—about 200 acres of deep black loamy land would suffice, at, say, 2*l.* per imperial acre, which, according to present times and future prospects, would be a fair rent for good land of this description. The number of cows to be kept for breeding will be the next consideration; but, before entering into particulars, it will be necessary to detail the mode of management requisite to support these animals and their progeny, till sold. Forty acres out of the 200 should be laid down to permanent pasture—the land being first thoroughly cleaned, well manured, and sown down with proper seeds;—the other 160 acres to be managed under a five-shift course of husbandry. Under this system, there would be, in

| | Acres. |
|---|---|
| New Grass ... ... ... ... ... | 32 |
| Two-year-old Grass ... ... ... ... ... | 32 |
| Oats ... ... ... ... ... ... ... | 32 |
| Barley and Wheat ... ... ... ... ... | 32 |
| Turnips, Potatoes, and Tares ... ... ... | 32 |
| Permanent pasture ... ... ... ... ... | 40 |
| | Acres 200 |

The number of short-horned cows such a farm would support under a certain mode of management, and selling the calves at certain ages, have next to be considered. In order to make the trade regular and uniform, a certain number must be disposed of annually. If the

* A hen having one-fourth blood of G. Sonneratii lays eggs speckled at the upper end, like a guinea-fowl'.

farm is supposed to be capable of keeping 36 breeding cows, the stock required will be—

12 two-year-olds in milk.
12 three-year-olds, do.
12 four-year-olds, do.

The following calculation will show what amount of capital is required to stock such a farm. Supposing the entry to be at Whitsunday, with sufficient Grass on the farm to keep the stock required; as no sale could take place the first year, the whole must be purchased to commence the system, and prepare for the sale in the following year. The stock of cattle, horses, &c., to be purchased, would be—

| | | | | |
|---|---|---|---|---|
| 12 two-year-old heifers, in milk ... | at £40 each | £480 | 0 | 0 |
| 12 three-year old do.... ... | ... at 40 ,, | 480 | 0 | 0 |
| 12 one-year-old do.... ... | ... at 25 ,, | 300 | 0 | 0 |
| 12 heifer calves do.... ... | .. at 15 ,, | 180 | 0 | 0 |
| 1 yearling bull ... ... | ... at 50 ,, | 50 | 0 | 0 |
| 5 horses ... ... ... | ... at 30 ,, | 150 | 0 | 0 |
| Implements, &c. of all sorts, say ... | ... | 80 | 0 | 0 |
| Guano ... ... ... | ... ... | 40 | 0 | 0 |
| Meal for servants, &c. ... ... | ... ... | 20 | 0 | 0 |
| Other outlays, including servants' wages, seed corn, &c. &c. .. ... | ... ... | 220 | 0 | 0 |
| Capital required ... ... | | £2000 | 0 | 0 |

The above may be said to be too high an estimate; but, in laying the foundation of a stock of this kind, nothing but the highest-bred short-horns must be selected, which can only be procured at high rates. The 220*l.* for incidental expenses will all be required, as there will be no crop on the farm the first year. The 40 acres of permanent pasture should graze the cows, and the 32 acres of two-year-old Grass should suffice for the heifers and horses—the 32 acres of new Grass to be cut for hay, except what may be used for soiling the horses or cows at night, and young calves. The bull calves must be sold in August, say at from four to six months old, and the 15 acres of Turnips should be sufficient for the cows, one-year-old heifers, &c., so that it will leave 17 acres more for other green crops, say

4 acres in Tares.
8 ,, Potatoes.
5 ,, Turnips, to be eaten off by sheep.

The cows should be drafted yearly, and sold in August, along with the bull calves, by public roup, and the cows stinted with high-bred bulls. The cast cows, being then only four years old, would be purchased by the breeders; and making a fair allowance for deaths or other casualties, there would be for sale yearly—

| | | | |
|---|---|---|---|
| 15 bull-calves, at £20 each ... ... ... | £300 | 0 | 0 |
| 12 cast cows in calf, four years old, at £30 each | 360 | 0 | 0 |
| | £660 | 0 | 0 |

Losses, from death by disease or accident, must be guarded against by insurance.

The next calculation will be as regards the crops and other products of the farm. The grain crops should stand nearly thus:—

| | Quarters. |
|---|---|
| 32 acres Oats, say 6 quarters per acre ... ... | 192 |
| For seed ... ... ... 22 quarters. | |
| ,, horses, say ... ... 40 ,, | |
| ,, servants' meal, &c., say 50 ,, | |
| 112 ,, | |
| Leaving 80 quarters Oats for sale. | |
| Two acres Wheat for farmer's use. | |
| Barley, 30 acres, say 6 quarters per acre ... | 180 |
| For seed ... ... ... 15 quarters. | |
| ,, meal ... ... ... 25 ,, | |
| 40 ,, | |
| Leaving 140 quarters Barley for sale. | |

The other items to be sold, besides the stock, should be as under:

| | | | |
|---|---|---|---|
| 140 quarters Barley, at 20*s.* ... ... ... | £140 | 0 | 0 |
| 80 ,, Oats, at 18*s.* ... ... ... ... | 72 | 0 | 0 |
| Milk of 20 cows, from August till, say, 1st Dec. Four cows' milk for the use of farm. | 40 | 0 | 0 |
| Spare Potatoes, say 20 tons ... ... ... | 50 | 0 | 0 |
| 5 acres Turnips, to be eaten by sheep ... ... | 25 | 0 | 0 |
| Proceeds of cows and calves ... ... ... | 660 | 0 | 0 |
| | £987 | 0 | 0 |

RENT, EXPENDITURE, &c.

| | | | |
|---|---|---|---|
| Rent ... ... ... ... ... | £400 | 0 | 0 |
| Rates and taxes ... ... ... | 10 | 0 | 0 |
| Interest on £2000 ... ... ... | 100 | 0 | 0 |
| Insurance of stock ... ... ... | 25 | 0 | 0 |
| Servants' wages, &c. ... ... | 80 | 0 | 0 |
| Seeds ... ... ... ... ... | 20 | 0 | 0 |
| Tear and wear of implements ... | 15 | 0 | 0 |
| Wear of horses ... ... ... | 15 | 0 | 0 |
| Cutting crop ... ... ... ... | 25 | 0 | 0 |
| Cutting hay ... ... ... ... | 5 | 0 | 0 |
| Daily workers ... ... ... | 20 | 0 | 0 |
| Tradesmen's accounts ... ... | 20 | 0 | 0 |
| Incidental expenses ... ... | 32 | 0 | 0 |
| | £767 | 0 | 0 |
| | £220 | 0 | 0 |

The above shows a profit of 220*l.*, which would be rather limited for a farmer so employed; but it will be seen that 100*l.* are set down for interest of capital, with an ample supply of meal, Potatoes, and milk, and two arces of Wheat and garden stuff. He might also keep a few Ayrshire cows, pigs, poultry, pigeons, sheep, lambs, and a small ox for beef, &c., so that the house would be kept in a great measure from the farm. As, on such a farm, young men are to be preferred as servants, the whole of whom should be lodged and victualled by the farmer, the wages are, therefore, set down as under:—

| | | | |
|---|---|---|---|
| Grieve, say ... ... ... ... ... | £15 | 0 | 0 |
| Two ploughmen, say ... ... ... ... | 21 | 0 | 0 |
| Cattle-keeper, say ... ... ... ... | 10 | 0 | 0 |
| A woman or boy assisting ... ... ... | 6 | 0 | 0 |
| One servant girl for house-work ... ... ... | 7 | 0 | 0 |
| Three for dairy and other work ... ... ... | 21 | 0 | 0 |
| | £80 | 0 | 0 |

This is ample enough, even if a few extra cows are kept, as well as those for breeding. An overflowing supply of milk should always be secured, which would cost nothing additional, in summer at least, when there should be plenty of spare Grass.

As every calf is allowed the milk of its own mother, they will be bad milkers if they do not do ample justice to the calves. The heifer-calves may be weaned at three months old, and the bull-calves should get their extra quantity of milk till sold, or, say, from 1st of June till August. This would be increasing their supply of milk in place of reducing it, as is too common a practice with breeders. The bull-calves, when exposed for sale in August, will be in first-rate condition, from receiving this extra supply of milk, more especially if they have been soiled with a little Clover or Tares. This may be thought too high feeding, but it is an erroneous notion; for if calves have been fed on sweet milk, or other nutritious food, in place of slops, they will be strengthened in their constitution, easier kept, and be less liable to disease. Look at calves which have suckled their mothers, how strong and robust they are, seldom being attacked with the diseases generally so common among calves! Little doubt can be entertained of many of these maladies being attributable to feeding with slops.

There is another absurd practice among breeders, of giving Turnip-tops to calves, which is considered a saving; but anything more injurious cannot be imagined, as these vegetables are of a laxative nature. Calves should never taste Turnip-tops. Give them what is natural, viz., sweet milk; and as they advance, provide them some additional nourishing food, of rather a solid nature, but not too strong. When properly nursed and well kept, calves get strong before winter—the severity of which they are thus enabled to withstand, more especially if descended from stocks with plenty of hair. Ill-fed calves, on the contrary, suffer severely in winter, and often fall victims to the parsimony of their owners. An idea is entertained by some breeders, that if all their cows produce calves, they are sure to be well paid; but one good calf is better than three bad ones. Many animals which would have made good oxen, heifers, or cows, are ruined when calves; they may recover, but not when young; so that the early maturity of such animals can never be attained. Every day's neglect in properly feeding calves retards their maturity; while every day's good feeding will tell in the animal's favour. On such a bull-breeding farm as now described, nothing but the best of food must be supplied to the calves, otherwise they will cut a poor figure when exposed for sale. It would be good policy for breeders to have an extra set of cows to suckle the bull calves as they should be, and for four months at least.

If the preceding calculations be correct, a bull-breeding trade will be a safe speculation to those who understand its principles; but it must not be undertaken by men who are not thorough judges of short-horns, and practically acquainted with their management. Such a farm should produce manure for itself; and by leaving every fourth or fifth drill of Turnips to be eaten off by sheep, it will tend to consolidate the land and prepare it for a Barley crop. The Tares and Potatoes could be raised with less manure than what is required for Turnips. The capital required for such a farm is considerable, being 10*l.* per acre; still, this shows five per cent. interest, and a fair remunerating profit. Extravagant profits from farming must not now be looked for; and to a farmer who admires and values good stock, this will be a most agreeable occupation. *Dickson, on the Breeding of Live Stock.*

## Home Correspondence.

*An Agricultural Machine not exhibited in the Crystal Palace.*—This machine is called a "Mercantile Relation Machine," and has been in use in these parts for many years. It has not been exhibited, for some or all of the following reasons. It is of too large dimensions, and would occupy too much room, the entire surface of a farm being embraced within the range of its operations at once. It could not be properly classed as the product of peaceful industry, because it is itself a propeller of industry, and its appropriate field of action is not always one of peace. It has been proposed to call this machine a universal grubber or universal scarifier; but the obvious objections to these names are, that they define only a small portion of the work to which it may be applied. They besides convey no correct idea of the form of the machine. A huge fly-wheel being attached to it, and to this a dredging box, with this it traverses the currents of agricultural prosperity, and effectually removes every obstruction. Occasionally a sinking agriculturist gets into this dredging box, and is tumbled over amongst other useless things. There is also a cairding apparatus attached. By means of this the population of our towns are cairded among the population of our counties. It is truly worthy of admiration, that slow and worm-like process by which the inhabitants of our cities are brought out rich and sent back poor. Universal tormentor is perhaps the most appropriate name by which it might be named. But the objections to this name are, that the tormentor is not so generally known as an agricultural implement as to convey the idea that the machine under consideration has an exclusively agricultural origin as well as application. The mercantile relation machine, although it possesses no very scientific name, is a wonderful machine. It thoroughly grubs, and ploughs, and harrows, and kicks, and knocks, and bruises, and threshes, and grinds, and comminutes to every conceivable degree of fineness. It sows to any required thickness, and thus reminds me that it reaps very imperfectly. As a general rule, it does all sorts of agricultural work in the rough and cruel line with admirable precision, from the pulling down of a house to the beating of a boy. When it is efficiently worked, it makes a fine stir in the country side, and it has been under admirable management for some years. Some of our rustics attribute to it a greater power than they allow to the Pope, and assert that it possesses some mysterious means of grubbing and harrowing the human mind. It is certain that in connection with its operation, men's vices have become small, and their virtues infinitesimal. There is a desideratum in machine making, to which our men of science have not yet attained, and in connection with it, there is a gold mine of prizes in reserve for another generation. I allude to the desirableness of possessing a machine that could spin you off a moral quality. How desirable, for example, would it be to have a machine that would weave a web of charity with which we might invest our clergy, or garments of courage with which to clothe our army. Now, I am not able to assert of this machine that it has attained for us any of these very desirable ends, but this I can affirm—It has weaved for us several patterns of a very durable fabric, and warranted to stand washing, of a web called the "web of hatred." To work this machine, we put some of our most sagacious and best paid labourers. Although the duties required exercise, more the intellect than the arms, these happen also to be the stoutest of their class. These men are known in the district by a peculiar name. The name denotes that their office is by no means of Saxon origin. It is probably from Holland, whence come all our excellencies in the mercantile way; or more likely still, from some of the early settlements of the Dutch on the coast of Africa. This machine works with tremendous impetus, and mutilates in a shocking manner any unlucky individual who may happen to fall within the range of its operations. The first of all duties, therefore, incumbent upon its superintendent, is the duty of self preservation. And in order to this, it is necessary that he acquire such a degree of dexterity in his manipulations that the machine shall not be permitted to bruise his own fingers. This dexterity in course of time is acquired, and it is incredible the amount of work some of our best workmen go through, and return from it quite hearty, and "fresh and clean as a ribbon," as we say in country phrase. PS. The writer of the foregoing is a farmer, and begs the aid of the Editor of the *Agricultural Gazette* to put some moral restraint upon the practice of "rouping" [*i. e.*, letting to the highest bidder] every farm whenever it falls out of lease. *Bastinado, East Lothian.*

*Beet Sugar.*—Taking great interest in the successful introduction of the Beet sugar industry into Ireland, I have watched with some anxiety the progress of your opinions, under the impression that the numerous evidences in favour of its prosecution might induce you to take a rather more extended view of the subject than your various remarks tend to promise. In your impression of May 24th you cite the authority of Sir R. Kane, who takes his information from sources of a comparatively ancient date in the annals of Beet sugar making; for it must always be remembered that it is only within the last few years, while the powerful protection afforded to that interest by the French Government has been gradually withdrawn, that the culture of Beet-root and its highly profitable conversion into sugar, by the compulsory aid of science, has attained such an unexpected rank in the productions of France. And even at the present time, with the total absence of protection, and a duty of 10 per cent. in excess of colonial sugar, the number of refineries is augmenting, and their increased produce will soon tend to give it the mastery of the market, by gradually excluding tropical grown sugar. That Ireland is peculiarly adapted to the perfection of root crops, no unprejudiced mind can for an instant deny. With great depth of soil, rich in vegetable constituents, and a humid climate, so necessary for the full development of the leafy portion of the plant, the influences imperatively required for the production of Beet are abundantly afforded; and no comparison can be made between its culture and that of the Tobacco plant or Sugar-cane, both of which require the powerful action of solar light and heat to bring them to maturity, since the juices of these plants are elaborated above ground, while the sugar yielding principle of the Beet-root requires darkness and moisture for its perfection beneath the soil. And if the general testimony of the numerous cultivators of sugar Beet this year in Ireland is to be credited, no doubt can now exist that with a crop promising from 30 to 40 tons per acre, they can feel disappointment in taking the initiative in an enterprize which opens so wide a scope for Irish industry. The statement made by Dr. Hancock before the British Association, and to which you refer in your Number for August 16th, abounds with such an apparent tissue of illiberal assumptions, that it can only be characterised as the prejudiced views of an agitator for some opposing interest, and I will not occupy your time by a refutation of his mis-statement of facts, as applicable to the present condition of the Beet sugar interest, as you have already admitted in your *Gazette* of the 6th inst., the able and unanswerable reply of Professor Sullivan to which I beg to refer your readers. With respect to the profit attached to the manufacture of Beet sugar, the Association (formed for the purpose of carrying it out in Ireland), assume as their data simply those which are obtained upon the Continent. The process is no secret, and with a raw material confessedly superior equivalent results may be fairly anticipated. The rate of labour is as low in Ireland as in France or Belgium; and fuel, that important item in manufacturing expenditure, abounds in the form of peat, at less

than half their cost, even upon the calculation that two tons are required to raise an equal amount of steam as one ton of coal. Besides, the Irish Beet Sugar Company has patented improvements which materially tend to diminish the first cost of machinery and labour, in the manufacture, by the application of which they are enabled to economise nearly the whole of the saccharine portions of the root, and produce a sugar not only free from the usual disagreeable smell and taste peculiar to Beet sugar, but quite equal in purity, appearance, and sweetening properties, to the cane grown Muscovado, or the English made refined sugar. In justice to our enterprise, which, if successfully carried out, must be eminently beneficial to Ireland, it is to be hoped that you will withhold the expression of opinions founded only upon the absence of a practical acquaintance with the subject, as a few weeks must now determine the important question of the Beet-root industry becoming a great feature in the reviving prosperity of Ireland. *Beta, Sept.* 10.

*North of Yorkshire.*—On paying a visit to this far-famed district, I was surprised to find so much useful land still cultivated in the old-fashioned way, with summer fallows and broadcast corn crops, full of weeds. The Turnips were commonly drilled in the Scotch system, but late sown and sadly neglected in scuffling and hand-hoeing; but still their appearance indicated the goodness of the soil, which seemed worthy of better management. It is strange that so many should still persevere in such management, or rather mismanagement, as is profitless in better times, and ruinous in these days of low prices, especially when they have a few specimens of superior cultivation, such as those exhibited in the well-cultivated farms of Messrs. Outhwaite and Jackson, but such are only the occasional exceptions to the general rule. Hay is better made in this than in most other districts. They have a good practice of putting it into "lap-cock," and of sweeping it up into "pikes," with a well-constructed hay-sweep. But their hay-time is too backward, being thrown into the latter part of July and the beginning of August, in consequence of their ruinous practice of eating their meadows in the spring, and even into May. They also mow much high land, which, though it is good pasture land, is very unsuitable for meadow. Too much reliance is placed on the hay-stack, for the want of more green food, Linseed compound, and the like. Hay is commonly an expensive and a very unprofitable article, and especially so when so many acres of good up-land pasture have to be mown for a small stack, as we frequently see in that district. There is much of useful land that lies too high for corn, except Oats; but it would grow good Turnips and other cattle crops, which should be more cultivated as a substitute for so much hay, and especially the injury done by eating up the meadow land in the spring. The cattle are fine animals for grazing, but not so good as formerly for the dairy. The breed of pigs is wonderfully improved. *J. H.*

*Thistles.*—At this time of the year the extraordinary number of Thistles in full seed, in hedgerows, might lead a novice in agriculture to imagine the plant was a favourite, and useful in the economy of the farm, instead of being one of the most mischievous weeds under the sun, each seed having wings on which it is carried over the face of the country for miles. Thus the industrious man, who cleans his land, is at the mercy of the sloven. In a day's ride sufficient seed may be seen to sow a thousand acres, only waiting for a breeze to disperse it. John Bull abused the Americans for being behind the world at the Exhibition. However, brother Jonathan can teach us how to build a yacht! If our countrymen will take a lesson from the Dutch and Belgians, on the art of keeping land clean, they will be wise. Where a weed flourishes corn will grow. *Falcon.*

*Reaping Machines.*—In a leader of your Paper you suggest that there is no reason why these machines may not be made for one horse. I hope that Messrs. Garrett will take the hint. The experience of all modern improvements show that large profits are to be obtained from large sales. Now large sales depend on prices not being beyond the means of the multitude, and I am satisfied that a good reaping machine, such as I have no doubt Messrs. Garrett and others may make, would be, next year, purchased to a very large extent, if not too costly, or too large. There is a great temptation to supply large farmers and amateur farmers—but in this instance, it is to be hoped that a large demand from all classes of farmers will be an object among the makers of this implement. *T. F.*

*Peat Charcoal.*—As I read the particulars and the result of the experiment of "P. K." I am disposed to apply his resultant figures thus:—As 40 is to 72, so is his ability to conduct an experiment, to what it ought to be. The case stands thus. Beans require heavy land; he puts them on land that is "very light." Dung helped the land to approximate to that state which is most congenial to the Bean crop, by its ability to retain moisture. "Peat charcoal," by way of antithesis, would, if possible, tend to make the "very light" land still more light, and still more uncongenial to the Bean crop. So much for its mechanical effects. The chemical reasons on this matter, I need not enter on. *W. E. Gill, Truro, Sept.* 15.

*The Suffolk Agricultural Relief Association.* — I was much gratified by the favourable notice of the above society by your correspondent "T. R.," in your last week's *Gazette*. It strikes me that "relief to tenant farmers" is a subject which may be most appropriately discussed in your Journal. I will not attempt here to enter into a discussion with "T. R.," as to the wisdom of the course we have pursued in selecting the five "objects of the Association;" I will content myself with remarking upon the present unhappy position of the tenant farmers, and the necessity for the immediate adoption of measures for relief. It is quite unnecessary to dilate upon the distress which we are and have been suffering. Perhaps it is hardly too much to assert, that in districts which depend chiefly upon the produce of corn, the farmers have for the last three years being living upon their capital. What with defective crops and low prices, they have ample cause for complaint. Now, how are matters to be mended? This was the question which set a few of us plain practical people a thinking. We met and meditated on the subject; and resolved, with calm but firm determination, to do all that in us lay to make known our grievances and obtain redress. It is a new thing for tenant farmers to act for and by themselves; we have had many difficulties to contend against, but we have also met with much to encourage us. And, as I hope to show in a future paper, we have already received such expressions of approval and promises of assistance, as have strengthened our resolve to persevere in our great undertaking, bating not a jot of heart or hope. I will conclude with the closing paragraph of the report read at the recent public meeting in the Corn Exchange, Ipswich:—"The committee wish to draw the attention of the meeting to the fact, that they have endeavoured studiously to avoid everything of a strictly party nature. They have endeavoured to frame their association upon a basis upon which politicians of every shade of sentiment may, if they will, unite. They believe that the attainment of their objects would greatly promote the public good, and they invite all who share in that belief, to join them in their efforts to obtain those ends." *N. W. Johnson, Hon. Sec., Ringshall, near Needham Market, September* 17*th.*

*Draining.*—I beg leave to approach the arguments of the Rev. G. Wilkins with the most profound respect, and to differ with becoming diffidence. He has the best side of the argument, and I wish him to maintain it on indisputable grounds. "Cold and wet ground," says the reverend gentlemen, "rapidly conducts the caloric from the earth's surface to the cooler regions below the surface, and the more stagnant water there is in the ground, the more rapidly will the caloric leave the surface to keep up the equilibrium below it." The rationale which I would respectfully submit is this, that evaporation is continually going on when the temperature is higher than 32° F., and thus cools the surface of the earth; and that caloric does not descend [It does not *descend* in water, because water is a bad *conductor* of it], is a well recognised, established fact. Hence the surface gets dried, and then baked into a hard crust, whilst the stagnant water below continues at the same low temperature. By percolation, it helps to augment "the cool refreshing spring," or fills the drain tiles. In a former paper, a correspondent took the pains to twit the reverend gentleman about deep draining his clay land, as if it were impossible to do so; and thus, for practice, was inflating his lungs, in anticipation of a loud laugh at science. "His land," he said, (I write from memory), "was hard in summer and so soft in winter that he could put no animal on it." This is a plain statement, as it should be, and like every plain and complete statement, facilitates the invited reply, if it does not, as in this case, actually suggest it. I have already shown how it became hard in summer, but how did it become soft in winter? Why the rain made it soft, to be sure. How could the rain make it soft, when the ground is so very fine, close, and tight, that deep draining is of no use, and the water cannot get through the land to the drains? But the water does get through, you say, to make it soft, even when baked hard by the summer sun; and if it can get through one inch of such land, why not through twelve inches; and if through one foot, why not five? for the laws of gravity hold good to a far greater depth. If argument fails to convince your "shallow draining" correspondent, let him set experience to work, and cut a five foot drain through such heavy land, if he can afford it, and that one cut will be his best schoolmaster, and teach him how to act in future. *W. E. Gill, Truro, Cornwall, Sept.* 15.

*Superphosphate, Adulteration, and Detection.*—Whilst so much attention is excited to the adulteration of guano, we must not lose sight of another concentrated manure, second to guano only in importance, particularly liable to adulteration and inferiority of quality, and more uncertain, if not more difficult of detection, than almost any other. The same sample, assayed by different methods, will give as many different results, unless we have recourse to precise analysis, which is too costly for practical farmers; so that the assays from different hands, being apt to disagree more or less, destroy the farmer's confidence. In some cases it seems to be adulterated with a direct view to elude chemical detection, the very last sample I assayed having required three different processes to get at consistent and trustworthy results. I have long wished a consistent, and not too complex, formula could be issued by the Royal Agricultural Society or other recognised authority for general use, as has been done for guano and some other matters; but the danger, in this case, is that, like publishing the private mark of a bank note, it might be a guide to the adulterator or low manufacturer, what to use, so as to escape detection. Such a general formula would therefore require extensive opportunities and practice to anticipate and defeat the varied ingenuity of these pernicious malefactors; and (if it cannot be) expected from any of the recognised authorities) would furnish excellent practice for the pupils of a chemical school; *i.e.* the specious adulteration and lowering, by different means and materials; and the attainment of a, not too complex, formula, which should disentangle the phosphoric acid, and its proportion of excess, as well as the alkaline salts and nitrogen, from all the different substances with which it might be speciously adulterated. If personality may be allowed, I would suggest Mr. Nesbitt, who as well as his pupils has already done some useful work in the phosphates, as well-circumstanced, if willing, to render this important service to the farmers; being myself unable, working alone, to devote the needful time to it, without encroaching too much on other occupations. As matters now stand I doubt whether there is any other manure, even guano itself, in which the farmer is, proportionately, so much cheated, as in superphosphate of lime. *J. Prideaux.*

*Nitrate of Soda.*—I have a six-acre field of Italian Rye-Grass. I mowed it for hay in June, and again in July. As soon as the second crop was carried, I top-dressed the field with 2 cwt. of nitrate of soda per acre, and in four weeks I had a better crop than before. When the men mowed it, their shoes and scythe blades were dusted with a reddish brown powder. Unfortunately we have lately had a good deal of rain, and just as the Rye-grass was ready to be carried, it got soaked with rain. When it became fine, we of course turned the "would-be hay" over, and then the men's clothes were covered with a greenish dust, just as if they had rubbed themselves against old park palings. The Rye-grass hay is worthless, from having been so drenched; it smells as ill as old thatch. What I want to know is, does nitrate of soda cause this hay to be so ill-smelling, and to take such great damage from the rain? and is this dust, "of a greenish hue," which is still in this hay, likely to be prejudicial to any animals that I may be fortunate enough to persuade to eat it this winter. If so nitrate of soda will prove a very expensive dressing to me, although the effect of it in the extra quantity of Grass was great. *W. G. D.*

*The Vetch.*—I have read with much interest, in your last Number, the article of "J. D." on the culture of the Vetch. There is one point of value in the cultivation of this legume to which "J. D." does not refer—I mean that of cleaning foul lands. The root of the Vetch is so large and fibrous that it almost honeycombs the soil on which it grows, and gives to the farmer a fine opportunity of cleaning foul land. Some years ago a field of 6 acres came into my occupancy, adjoining the farm which had been cultivated for many years as Potato ground, until the old man, who had previously occupied it for 40 years, had got it into such a state that it produced a glorious crop of wild Marigolds, and very few Potatoes. It came into my possession at Michaelmas "foul as foul." I ploughed it up roughly, sowed Winter Vetch, with a sprinkling of Rye; the Vetch (or as we call it in the midland counties Winter Dill) came up vigorously, and so did the Rye, and so did the Marigolds, and so did all the other weeds, for they were "Legion." About the 20th of June, when the Vetches were coming in flower, and the Marigolds also, I put in the scythe, mowed all down, and, the weather being favourable, made a stack of excellent hay. The men said the cows would not eat it, on account of the bitterness of the Marigold, but they did eat it, and twisted it down merrily, Marigolds and all. As soon as the ground was cleared, I put in the scuffler, tore up every root of every kind, and cross scuffled, then forked out everything that the fork would catch, burned all, and scattered the ashes; ploughed again, sowed stone Turnip, a fair crop; fed off with sheep; ploughed and cleaned again; spread on the 6 acres two waggon loads of magnesian limestone [Qy. *lime*], from Breedon Hill, Leicestershire, and sowed with Barley; I reaped a crop of 8 quarters to the acre and no Marigolds, of any consequence, ever after appeared. I have a high opinion of the winter Vetch as an assistant to the farmer in cleaning foul land; but whatever the weed be, take the depth of summer heat to kill it; one hot day's summer's sun, if you will bring the roots to the surface, will do more for you than you could do in a month otherwise, and at any expense. The soil of this field was light, and the subsoil gravel; as regards cleaning land nothing is so effectual or so cheap as working it well under a hot sun. Magnesian lime is excellent manure moderately used, in excess it is utter destruction; the lias lime may be used on land almost *ad libitum*. *J. C. Mott, Liverpool, Sept.* 21.

## Societies.

ROYAL AGRICULTURAL OF IRELAND.—*Observations on Hay-making.*—The following is the paper read by Mr. BALL at the evening meeting of the above society on Thursday, the 4th inst.

Mr. BALL commenced his observations by stating that the points to be aimed at, in the saving of hay, were—1st, the getting it together for winter use, with all its nourishing saccharine juices in their greatest quantity and perfection; 2d, in preserving the hay in the greatest bulk, consistent with the above; and 3d, in saving it with the least possible cost to the cultivator.

*Time of Cutting.*—New Grass, or first year's crop, should be cut when the red Clover has two or three flowers full blown, and the Italian, or other Rye-grass, just beginning to show flower. Old meadows may stand with advantage till a later period of ripening—that is, till Cocksfoot, the Fescues, and other varieties, are in full flower. It frequently happens that persons, who have heard of the disadvantages of late cutting, fall into the opposite extreme, and lose seriously in the bulk of the crop. Late meadows and bottoms, which throw up but few seed stems, should be cut more with a view to the state of the undergrowth or foliage of the Grass—a matter of no small importance in meadows of this description.

*Treatment in the Field.*—The Grass being cut, should lie as

short a time as possible in swathe; never, unless absolutely prevented by rain, more than one night; still less should it be left, after being once shaken out, in that state all night, but should be wind-rowed, or put into small cocks each night, as much to give the ground the chance of being dried by the sun or wind, as to preserve the colour and sap of the hay itself. A hay-shaker is an excellent implement, and will do its work better than can possibly be performed in any other way.

Col. Hall here stated, that he found it much less expensive, and saved much time, to have the Grass well tedded and spread out at night; and, that in his judgment, the hay thus saved was no way deteriorated in quality, and he wished to have the opinion of more practical men on the subject. On the third or fourth day, under favourable circumstances, hay will be fit to be put together, in cocks of such a size as two men can make standing on the ground, and not on the cock; and in two or three days more may, with safety, be drawn into the rick. Except under very peculiar circumstances of weather and climate, hay should never be made into tramp cocks; but when it becomes necessary to do so, the very first opportunity of fine weather should be seized to draw it home, instead of leaving the hay, as is too often the case in Ireland, two and three months standing in the field—a system that cannot be too strongly reprobated, the loss resulting from tops and bottoms of cocks damaged, ground covered, the second crop destroyed in getting off the first, and the deterioration of the bulk, being fairly estimated at not less than 10 per cent.

*Management of the Rick.*—When hay is legitimately grown for sale, near large towns, and the custom of the market is, as in Dublin, to use it over-dried, with nearly all the nourishing juices extracted, we must only act accordingly, and leave it in tramp cock till it can be put together with little or no fermentation, until the consumers learn better their own interest and advantage. But when grown for home use, and more especially for cattle, hay is improved by taking what farmers call a good sweat in the rick, and a quarter of a hundred weight of common salt to the ton, distributed each course, in the making, will help to preserve the colour, and render it much more palatable and wholesome for all descriptions of cattle. Returning from a digression, he resumed his subject, by stating that the formation of chimneys in ricks was an excellent contrivance for letting off the steam rising from the heating hay, and checking excessive fermentation, when formed perpendicularly, and without lateral flues, calculated to create a draft of air through the rick—this being the most approved way of setting it on fire, if there was a tendency that way.—Mr. Goode then stated, in answer to the Earl of Clancarty, Sir R. Kane, and several other gentlemen, that in making the staddle for the hay-rick, flues both longitudinal and transverse, were formed; and from the point where these intersect each other, upright chimneys were made as the rick progressed in height, and, when those chimneys were sufficiently high, then the cradles were introduced horizontally over the tops of the chimneys—not transversely, but longitudinally—to take the tops of all the chimneys, so that a continual draught was maintained, by the introduction of cold air below, and the escape of the heated and moist air permitted above—which, as far as his experience went, prevented all danger from the rick firing.—Mr. Ball then went on to observe that the body of the rick should be carried up long and square, and the roof short and flat, thereby saving expense in pitching to a great height, and also saving in the thatching. He strongly recommended every farmer to have a rick-cover—it would pay its own cost in one wet season. He stated that hay-barns, where there was a large establishment and a great deal of hay to save, were well worth erecting, particularly where the material could be had at home at first cost from the thinnings of plantations, &c. Mr. Ball concluded his observations by saying that, although it was no part of his subject, the management of hay in consumption was a point upon which there was great room for improvement, and much need of practical instruction, and he trusted the attention of the society might be turned to the subject in the course of the ensuing winter.

## Notices of Books.

*A Practical Guide to the Breaking and Training of the Young Horse.* By Corporal-Major Robert Turner, Assistant Riding Master, Royal Horse Guards. Park, Furnivall, and Parker, Whitehall.

A pamphlet, full of detailed and condensed information on its subject; giving the results of a lengthened experience. The work refers to the horse's "appointments," and the principles of training; and it gives in detail the 12 lessons which are supposed to furnish the education required by the animal. It also refers to the defects and infirmities to which the horse is liable. It is tersely written by a practical man, and is not by any means a case of book-*making*.

METEOROLOGICAL REPORT.—September.
(*Continued from p.* 606.)

| Date. | Time. | Max. | Min. | Wind and Weather. |
|---|---|---|---|---|
| Sept. 16 | 7.30 a.m. | 30.43 | ... | |
| 18 | 10.20 p.m. | ... | 30.08 | Northerly. Moderate; bright starlight. |
| 19 | 7.10 a.m. | 30.03 | ... | N. Brisk. Fine and pleasant |
| | 11.50 p m | ... | 29.97 | day. |
| ‡ 20 | 1.40 a.m | ... | 29.77 | NNW. Gentle; fine sunny |
| | 7.30 a.m. | 29.99 | ... | day. Barometer steady. |
| | 10.30 p.m. | 29.99 | ... | |
| Sun. 21 | 8 a m | 29.99 | ... | Northerly. Moderate. Foggy |
| | 3 p.m. | 29.99 | ... | at sunrise; clear sunny day. |
| | 6.35 p.m. | ... | 29.97 | |
| ‡ 22 | 7.35 a.m. | ... | 29.97 | Northerly. Gentle. Bright |
| | 10.30 p.m | 30.00 | ... | sunny day; afternoon warm, but very hazy. Barometer rising steadily. |
| 23 | 11.15 a.m. | ... | 30.02 | A.M. S. Cloudy. Overcast with gentle rain, and foggy. |
| | 7.15 p.m. | 30.03 | ... | P.M. SW. Clear and fine; very heavy bank of fog along western horizon. |

‡ Continued from last report. Fine, pleasant, warm sunshiny weather, and the wind northerly, combined with a falling barometer, is so unusual an occurrence: about this time last year we had precisely the same coincidence, which was accounted for by the passage of a very tremendous hurricane over the Cape Verd Islands (Sept. 3d, 1850), from east to west, which drew in the air from the poles towards the equator, but with an intense degree of cold not experienced on this occasion. This storm must therefore have lain a long way off to the northward, I imagine.

† This storm came from the south-west, and is crossing to the eastward over the north of England, or even of Scotland.

Dorchester [Sept. 25]. *F. P. B. M.*

*(To be continued.)*

## Miscellaneous.

*Liquid Manure Tank.* — To Mr. Richard Dobell, Leftwich, near Northwich, as tenant and occupier, for constructing the best tank, *3l.* Inspector's Report: The principal tank is 13 feet long, 6 feet wide, and 9 feet deep, inside measure. The bottom is of bricks set on edge; and the sides, ends, and top (which is arched), is also brickwork, of 9 inches thickness. There is a division inside, also of brickwork, and the whole is cemented. The compartment into which the urine first enters retains all sediment, which can be cleared out at any time. In the other division a pump is fixed, by which the liquid manure is loaded into a properly-constructed water-cart, and so conveyed to the land. From the tanks to the shippon and stable a tile drain is laid, on a brick bottom, with a grid and small cesspool in each building. Behind the house and piggeries, there is another tank for the purpose of receiving the wash and urine from those places. This is a circular one, 10 feet deep and 8 feet diameter. The sides and bottom are cemented brickwork, but the top is open. With the liquid collected from this tank, ammoniacal water from a neighbouring gas works is mixed in proportion of about one-sixth, and carted on the land. By these tanks, 6 to 8 acres of meadow land are kept in a very productive state. *From the Journal of the Manchester and Liverpool Agricultural Society.*

## Notices to Correspondents.

Books: *J H.* The one was noticed last week. The other is the work on agriculture, by Mr. Jackson, published by Chambers of Edinburgh.

Lime and Salt: *Salopian.* Slake 60 bushels of lime with water containing 3 cwt. of salt in solution, and let it lie in a heap for a month—that will be a dressing for an acre; or if you want the salt with only so much lime as will suffice to decompose it, add to 3 cwt. of salt about an equal quantity of lime, and let them be mixed together for some months before use.

Oilcake: *O C.* Give a broken cake or two—say 4 lbs. daily. Break it into small fragments, and place them in the manger. It will make the milk richer: but not better tasted.

Poultry.—The "Sebright Bantam": *R H.* We regret we cannot tell you where to procure this breed (Silver or Gold) perfectly "true." We have long and vainly tried to procure some *small* Sebright cock bantams for ourselves; as also some of the very small hens, but have never been able to succeed. Since the death of the worthy baronet, the breed has "gone back" fearfully. *W. K.*—The Roup in Fowls: *C W H.* In addition to what was recommended in this Paper last week, try small pellets of butter, soot, and chopped Rue. Give the infected birds two of these, morning and evening, and let them have the full range of a dust-heap; also let them scratch among the *débris* of an old wall. If these do not check the disorder, bring "the knife" into instant use. Keep those that are gradually recovering, from the rest; and let them be placed in a warm situation. *W. K.*

Potato Disease: *Navan.* The price of the pamphlet is one shilling. The address of the author was given in the review of his work.

Potatoes: *J M.* As many as 160 sacks have been grown per acre—that is about 17 tons per acre.

Rye and Winter Tares: *J B N.* They are the best things you can sow now for spring food We have had no experience of malt-dust as food for cattle.

## Markets.

COVENT GARDEN, Sept. 27.

Peaches and Nectarines remain nearly the same as last week; the best samples fetch fair prices, but the sale for inferior fruit is heavy. Pines and Grapes are abundant. A few West Indian Pines still make their appearance. Morello Cherries are now all but over. Good Plums are scarce, as are also Oranges and Lemons. Nuts remain nearly the same as quoted last week. Carrots, Turnips, Cabbages, &c., are sufficient for the demand. Potatoes are generally good in quality. Lettuces and other salading are sufficient for the demand. Mushrooms (bushels) appear but slowly. Cut flowers consist of Heaths, Pelargoniums, Mignonette, Heliotropes, Stephanotis, Moss and Provins Roses.

FRUIT.

| | |
|---|---|
| Pine-apples, per lb., 3s to 5s | Pears, dessert, p. doz., 2s to 4s |
| Grapes, hothouse, p. lb., 2s to 5s | Almonds, per peck, 6s |
| — Lisbon, per lb., 9d to 1s | — sweet, per lb., 2s to 3s |
| Peaches, per doz., 4s to 8s | Lemons, per doz., 1s to 2s |
| Nectarines, per doz., 4s to 8s | Oranges, per doz., 2s to 4s |
| Cherries, per lb., 6d to 2s | — per 100, 14s to 30s |
| Melons, each, 1s to 4s | Nuts, Barcelona, p. bsh, 20s to 22s |
| Currants, p. hf. sieve, 4s to 5s | — Brazil, p, bsh., 12s to 14s |
| Plums, per punnet, 1s to 2s | Filberts, per 100lbs., 55s to 70s |

| New Hay ... ... | — — | | J. Cooper. |

The trade very dull.

HOPS.—Friday, Sept. 26.

Messrs. Pattenden and Smith report that the market is well supplied with the new growth, which are selling freely at the following prices:

| | | | |
|---|---|---|---|
| Mid & East Kents | 160s to 252s | Sussex ... ... | 120s to 140s |
| Weald Kents ... | 130s to 160s | Yearlings & old Hops ... | — ... |

Duty 110,000*l.*

SMITHFIELD, Monday, Sept. 22.

The number of Beasts is again very large; the average quality is rather improved. Trade is very heavy, but prices are not much altered. Sheep and Lambs are plentiful; trade is worse, except for choice Downs. We have a large number of middling Calves at market, which make exceedingly low prices. A good one still makes 3s. 6d. There is an extraordinary arrival of foreign Pigs; they much interfere with the sale of second-rate meats. From Holland and Germany there are 1418 Beasts, 6290 Sheep, 176 Calves, and 562 Pigs; and 3000 Beasts from the northern and midland counties.

| Per st. of 8 lbs.— | s | d | s | d | Per st. of 8 lbs.— | s | d | s | d |
|---|---|---|---|---|---|---|---|---|---|

Beasts, 5270; Sheep and Lambs, 32,120; Calves, 269; Pigs, 862.

Friday, Sept. 26.

We have a very large supply of inferior Beasts, and only a few purchasers, even at the low prices we quote. There being but few of the choicest kinds on offer, they are readily sold at late rates. The number of Sheep is by no means large, yet fully adequate to the demand. Monday's prices are with difficulty obtained. Trade is exceedingly heavy for Calves; 3s. 6d. is an extreme quotation; only a few of the choicest reach it. From Germany and Holland we have 670 Beasts, 2370 Sheep, 315 Calves, and 104 Pigs; 300 Beasts from the northern and midland, and 95 milch cows from the home counties.

| Best Scots, Here- | | | | | Best Long-wools . | 3 | 4 | — 3 | 6 |

Beasts, 1231; Sheep and Lambs, 6,940; Calves, 542; Pigs, 405.

MARK LANE.

Monday, Sept. 22.—The supply of Wheat from Essex to this morning's market was moderate, but good from Kent and the east coast. White must be written 1s. and red 2s. per qr. lower than this day se'nnight. The attendance being chiefly confined to the town millers, transactions in foreign were too limited to admit of our altering quotations.—Fine malting Barley sells readily at last week's prices. Other descriptions are a slow sale and the turn cheaper.—Beans are 1s per qr. lower.—Peas being scarce, sell at an advance of 1s. per qr.—The Oat trade is dull, except for Russian qualities.—In Flour there is little doing.

Friday, Sept. 26.—The arrivals of grain and Flour, particularly foreign, have been small this week. This morning's market was badly attended, and the demand for all articles limited. The value of Wheat, Barley, Beans, and Peas must be quoted nominally as on Monday.—The Oat trade is heavy, and new corn is 6d. per qr. cheaper.—Sales of barrel Flour have been effected to some extent at rather reduced rates.—A few cargoes of P. O. Wheat arrived on the coast have been sold at 29s. to 29s. 6d. per qr., including a large one for Antwerp, buyers paying the extra freight and insurance. Maize is inquired for at 26s., but held at 26s. 6d. per qr. f. o. b., including freight and insurance.

Liverpool, Tuesday, Sept. 23.—Except a moderate quantity of Oats and a good supply of Oatmeal, the receipts into this port from Ireland since Tuesday last are small, and those coastwise trivial. At our Corn Exchange this morning no lively proceedings were observable in any department of the trade; importers of foreign Wheat, however, refusing to follow the decline in London yesterday, continued to require last Tuesday's rates, at which, and in partial cases at a slight abatement, sales upon a moderate scale were effected. Of farmers' new Wheat the supply was considerable, and, the quality and condition being excellent, it was taken rather freely at our quotations. Barley, Beans, and Peas were taken very sparingly at former rates. In Malt, no change was apparent. Oats were the turn cheaper, and Oatmeal declined 1s. 6d. per load. We had a moderate demand for Indian Corn on the spot, at full prices. Friday, Sept. 19.—Having a tolerable number of home and country millers at our market this morning, good descriptions of foreign Wheat were held rather firmly by importers, and a fair amount of business was transacted, but our local buyers being inactive, no advance was obtainable. Barley, Malt, Beans, and Peas were difficult of sale, and each slightly depressed in value. Oats receded 1d. per 45 lbs., and Oatmeal 6d. per load, with a limited demand. Good samples of Indian Corn were 6d. per qr. dearer to-day, and several more floating cargoes changed hands.

GLASS. GLASS.

## HARTLEY'S PATENT ROUGH PLATE GLASS, FOR RIDGE AND FURROW ROOFS, GREEN-HOUSES, RAILWAY STATIONS, ENGINE SHEDS, MILLS, MARKET-HALLS, AND PUBLIC BUILDINGS GENERALLY.

For Conservatories, Public Buildings, Manufactories, Skylights, &c. &c.

*Packed in boxes of 50 feet each.*

6 by 4 in. and 6½ by 4½ in., 12*s.* per box; 7 by 5 in. and 7½ by 5½ in. 13*s.* 6*d.* do.; 8 by 6 in. and 8½ by 6½ in. 15*s.* do.; 9 by 7 in., 9½ by 7½ in., and 10 by 8 in., 16*s.* 6*d.*

*N.B.—The Patent Rough Plate, one-eighth of an inch thick, is supplied in quantities 62 by 16 inches, for 10 feet span ridge and furrow roofs, at a reduced price.*

NOTE.—Squares are charged according to the superficial contents, except where the length exceeds the restriction above, in which case the higher price is charged irrespective of the contents.

*Bending.*—1-8*ths*, 6*d.*; 3-16*ths*, 9*d.*; ¼ *inch*, 1*s. per foot, net.*

*Irregular shapes are charged as squares.*

*When Crates are ordered, the 30-inch widths will be sent, unless otherwise specified.*

THE PATENT ROUGH PLATE, one-eighth of an inch thick, and weighing 2 lbs. to the foot, has now become an article of very extensive and increasing consumption.

*It is universally admitted to be the best and most suitable Glass for Ridge and Furrow Roofs, Greenhouses, Factories, Workshops,*

And all such like purposes, and is a cheap and efficient substitute for Fluted or Obscured Glass, where the object is to intercept the vision without diminishing the light. Its non-transparency, strength, and cost (being no more weight for weight than Common Sheet Glass), render it eminently suitable for the Glazing of Conservatories and Roofs of all kinds; Blinds are unnecessary, and when used in Greenhouses *no scorching occurs.*

Where still greater strength is required the 3-16ths and ¼ inch thick will be found much cheaper than the Common Rough Plate. Samples will be forwarded on application, by applying to JAMES PHILLIPS & CO., HORTICULTURAL GLASS MERCHANTS, 116, BISHOPSGATE-STREET WITHOUT, LONDON.

GLASS.

## THOMAS MILLINGTON'S FOREIGN SHEET GLASS is far superior to any other manufacture, as well as cheaper. In 100 feet boxes packed for immediate delivery.

| | | | | | | |
|---|---|---|---|---|---|---|
| 6 inches by 4 | and | 6½ by 4½ | ... | ... | ... | 13*s.* 0*d.* |
| 7 ,, | 5 | and | 7½ by 5½ | ... | ... | 15 0 |
| 8 ,, | 5 | and | 8 by 5½ | ... | ... | 15 0 |
| 8 ,, | 6 | and | 8½ by 6½ | ... | ... | 17 6 |
| 9 ,, | 7 | and | 10 by 8 | ... | ... | 20 0 |
| 12 ,, | 10 | and | 13 by 9 | ... | ... | 20 0 |

And many other sizes, or cut to order in various thicknesses. Cases containing large Sheets, in 100, 200, and 300 feet, at 21*s.* per 100 feet.

ROUGH PLATE, perfectly flat, ⅛ in. thick, best manufactured.

In sizes under 15 inches ..... 6*d.* per foot.
,, ,, 35 ,, ..... 8*d.* ,,
,, ,, 50 ,, ..... 9½*d.* ,,
,, ,, 75 ,, .....12*d.* ,,

Milk Pans, 2*s.* to 6*s.* each; Metal Hand-frames, Glass Tiles and Slates; Cucumber, Propagating, and Bee Glasses; Wasp Traps, Glass Shades, and Plate Glass, at 87, Bishopsgate-street Without, same side as Eastern Counties Railway.—Established 100 years.

GLASS FOR CONSERVATORIES, &c.

## HETLEY AND Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 35, Soho-square, London.

See the *Gardeners' Chronicle* first Saturday in each month.

## GLASS FOR PIT FRAMES, HOTHOUSES, &c., in Boxes of 100 feet, 8*s.* 6*d.* each.

4½ by 3 ... 5 by 2½ ... 6 by 2½ ... 6 by 3½ inches.
4½ by 3 ... 5 by 3 ... 6 by 3 ... 6½ by 3
4½ by 3½ ... 5½ by 3 ... 6½ by 3 ... 6½ by 3½

Larger Squares increase in price according to size. Every size kept ready packed in boxes, and may be had at a moment's notice.

Extra Crown, Sheet, and Patent Rough Plate Glass, cut to size for Conservatories, Greenhouses, &c.

Gardeners and others glazing on Mr. Paxton's plan can be supplied with Sash-bars of any length for the purpose.

PROPAGATING, CUCUMBER, FERN, PEACH, and every description of Garden Glasses.

Bailiffs, Farmers, Dairymen, and others supplied with Lord Camoy's Milk Syphons, Milk Lactometers, Glass Milk Pans, Glass Tiles, Slates, &c., for collections of which Messrs. COGAN and Co. were honoured with the Silver Medal of the Dublin Society, as also the Silver Medal of the Liverpool and Manchester Society held at Warrington in September last.

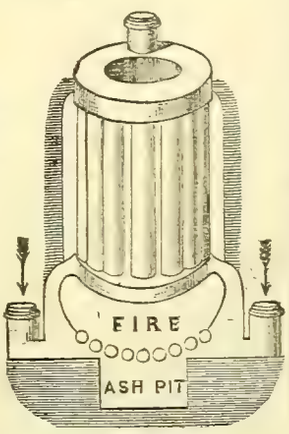
For Estimates, Prices, and further particulars, please address Messrs. COGAN and Co., 48, Leicester-square, London.

Glass Shades, Gas Glasses, White Lead, Colours, &c., as usual.

## WARMING AND VENTILATING FOR CHURCHES, CONSERVATORIES, AND OTHER BUILDINGS.—The most efficient and economical Hot-water Apparatus, supplied and erected for the above purposes, fitted with improved boilers, requiring no brick-work, capable of working 14 hours without attention. Also the THERMANTERION, a cheaper and simpler apparatus, especially adapted for buildings only used occasionally.—Apply to SPILLER and TAYLOR, Battersea, near London.

FARM AND COTTAGE PUMPS.

## PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.



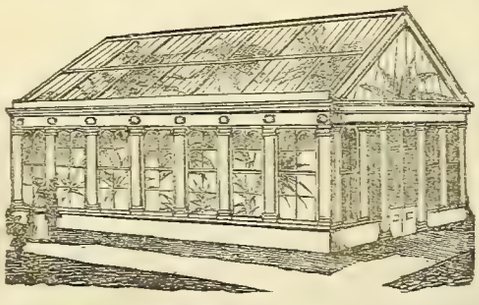
Patent Pump ... ... £1 16 0
Patent Pump, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing ... ... ... 2 12 0
Larger sizes if required.

May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers.

JOHN WARNER & SONS,
8, Crescent, Jewin-street, London.

Every description of Machinery for Raising Water, Fire Engines, &c. The usual allowance to the Trade.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.



J. WEEKS AND Co., King's-road, Chelsea, HORTICULTURAL, ARCHITECTS, ENGINEERS, and BUILDERS. These Boilers are very powerful, durable, and economical. The fire warranted to last 15 hours without attention. The Furnace Bars are Hollow Tubes, through which the return water passes before entering the upper part of the Boiler, thereby causing a very rapid circulation, and producing double the effect from the same quantity of fuel.

J. WEEKS and Co., King's-road, Chelsea, CHALLENGE the whole world to make a Boiler that will produce anything like the same effect, with the same quantity of Fuel, in a given time. It is one of these Boilers that warms the water of their VICTORIA REGIA Tank, which contains 9000 gallons, and also heats several large Forcing-houses and ranges of Pits, with a small consumption of fuel.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

HORTICULTURAL BUILDING AND HEATING BY HOT-WATER, AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.

GRAY AND ORMSON, Danvers-street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are now in a position to execute orders on the lowest possible terms.

G. & Co. have been extensively employed by the Nobility, Gentry, and London Nurserymen, and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-Water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

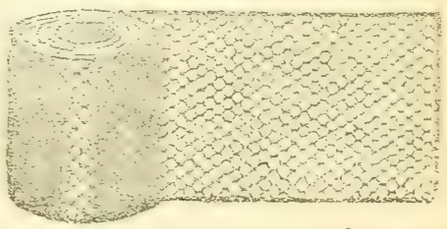
## TO BE SOLD CHEAP, a GREENHOUSE, 20 feet by 12 feet; also a WARDIAN CASE, heated by hot water. Particulars to be had of H. COLES, Seedsman and Florist, 43, Cranbourne-street, Leicester-square, London.

H. C. begs to inform the nobility and gentry that he will forward upon application a List of Prices for Greenhouses, Vineries, and Forcing Pits, heated by hot water, at a great reduction in price.

TO NURSERYMEN, GENTLEMEN'S GARDENERS, &c.

## EDWARD KEMP respectfully intimates to those friends who have not yet laid in their stock of PEAT, LOAM, &c., that they ought not to delay, as the weather is now very favourable, and cannot be expected to last much longer. He is now getting in some of excellent quality, and respectfully solicits their early orders, addressed to E. KEMP, 15, Ann's-place, East-street, Old Kent-road, London.

N.B. Silver Sand, and all other Soils, as usual.



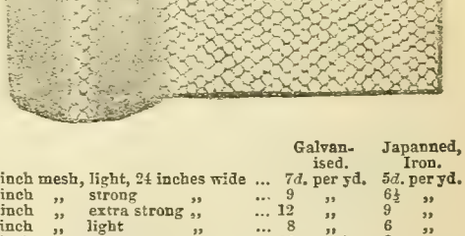
PURVEYOR TO HER MAJESTY, H.R.H. PRINCE ALBERT, AND THE KING OF THE NETHERLANDS.

## JOHN BAILY, 113, Mount-street, Grosvenor-square, London, Dealer in all sorts of USEFUL AND ORNAMENTAL POULTRY; Domesticated Wild Fowl; Gold, Silver, and common Pheasant Eggs for Hatching; all sorts of Fancy Fowls' Eggs, large Aylesbury Ducks &c.

BAILY'S registered PHEASANT AND POULTRY FOUNTAINS, by which Birds are ensured a supply of clean and wholesome water, and the lives of thousands of Chickens and Pheasant Poults saved—1½ quarts, 17*s.* 6*d.*; 7 quarts, 25*s.* 6*d.*; 3 quarts, 13*s.* 6*d.* Drawings and particulars forwarded by post on application.

BAILY'S "Hints for the Management and Fatting of th Dorking Fowls for the Table," price 1*s.* 6*d.*

WIRE NETTING ONE PENNY PER SQUARE FOOT.



## GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

| | | | |
|---|---|---|---|
| 12 inches wide | 3*d.* per yard. | 30 inches wide | 7½*d.* per yard. |
| 18 ,, ,, | 4½*d.* ,, | 36 ,, ,, | 9*d.* ,, |
| 14 ,, ,, | 6*d.* ,, | 48 ,, ,, | 1*s.* ,, |

Galvanised do., 1*d.* per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1*s.* 6*d.* per running yard; if galvanised, 2*s.* Also every description of Wire Nursery and Fireguards. Wire House-lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1*s.* 10*d.* per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6*d.* per running foot; Flower Trainers, from 3*d.* each; Garden Arches, 20*s.* each. Flower Stands, from 3*s.* 9*d.* each; Galvanised Tying Wire for Plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 44, Skinner-street, Snow-hill, London.

## GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.

| | Galvanised. | Japanned, Iron. |
|---|---|---|
| 2-inch mesh, light, 24 inches wide ... | 7*d.* per yd. | 5*d.* per yd. |
| 2-inch ,, strong ,, ... | 9 ,, | 6½ ,, |
| 2-inch ,, extra strong ,, ... | 12 ,, | 9 ,, |
| 1½-inch ,, light ,, ... | 8 ,, | 6 ,, |
| 1½-inch ,, strong ,, ... | 10 ,, | 8 ,, |
| 1½-inch ,, extra strong ,, ... | 14 ,, | 11 ,, |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised sparrow-proof netting for Pheasantries, 3*d.* per square foot. Patterns forwarded post free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

## ZOOLOGICAL GARDENS, REGENT'S PARK.—The URAN UTAN, presented by the Governor of Singapore, is exhibited daily from 12 to 6 o'clock, together with the ELEPHANT CALF, and the HIPPOPOTAMUS, presented by His Highness the Viceroy of Egypt. The Band of the First Life Guards will perform, by permission of Colonel Hall, at half-past 3 o'clock, on every Saturday, until further notice. Admission 1*s.* ON MONDAYS 6*d.*

NEW SHOW ROOMS FOR BEDSTEADS.

## HEAL AND SON have erected some extensive Warerooms for the purpose of keeping every description of Bedsteads. In Iron their stock will include every sort manufactured, from the cheap Stump, for servants' use, to the handsomely ornamented tubular-pillared Canopy, as well as Brass Bedsteads of every shape and pattern; and in wooden Bedsteads their Rooms are sufficiently extensive to allow them to fit up a variety, both in Polished Birch and Mahogany, of Fourpost, Canopy, and French, and also of Japanned Bedsteads—in fact, to keep in Stock every sort of Bedstead that is made; and they have also a general assortment of Furniture, Chintzes, Damasks, and Dimities, so as to render their Stock complete for the Furnishing of Bedsteads as well as Bedding. And without attempting to compete with the prices at which the lowest class of Furniture is sold, and which is fit for no useful purpose, their new Stock will be found to be priced on the same principle by which their Bedding trade has, during the last 30 years, been so successfully extended, and the goods, whether of a plain and simple pattern, or of a handsomer and more expensive character, are of well-seasoned materials, sound workmanship, and warranted.

HEAL and Son's list of Bedding, containing full particulars of Weight, Sizes, and Prices of every description of Bedding, sent free by post, on application at their Factory,

196 (opposite the Chapel), Tottenham Court Road, London.

## *SALES BY AUCTION.*

FULHAM

TO MARKET GARDENERS, FARMERS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, on the premises, Dawes lane, Walham-green, Fulham, on MONDAY, October 6, at 12 o'clock, by order of the proprietor, in consequence of the Land being wanted for other purposes, the whole of the STOCK of a MARKET GARDENER, comprising a large quantity of fine Rhubarb of best sorts, Cauliflower Seed, seven Store Pigs, five Sows and Pigs, 54 3-light Boxes and Lights, 400 Hand-glasses, a useful Black Cart-horse two capital Market Carts, Harness Chaff-box, Corn-bins, large Ware-tub, Iron Tank, Wash-butt on wheels, Wheelbarrows, 36-round Ladder, Water-cans, Baskets, Potato Punnets, and Garden Tools; also a large quantity of Manure, &c.—May be viewed prior to the sale, and Catalogues had, on the premises; of Mr. PRESTON, 2, Rupert-street, Haymarket; Mr. BOTHWICK, 547, New Oxford-street; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

HAYES, MIDDLESEX.

TO GENTLEMEN, NURSERYMEN, FLORISTS, and Others.

MESSRS. PROTHEROE AND MORRIS are directed by the Executors of the late Mr. W. Burdett to sell by Auction, on the premises the "Waggon and Horses," Hayes, Middlesex, about a mile from the Southall Station, on WEDNESDAY, October 8th, at 12 o'clock precisely, the whole of the stock of EVERGREENS, a large quantity of fine Standard ROSES, Gooseberry and Currant Trees, Herbaceous Plants, Box Edging, &c.; together with a 7 light Pit, Hand-glasses, seven Hives of Bees, Wheelbarrows, Carpenter's Bench and Tools, a capital 26-round Ladder, Tent Bedsteads, two Portmanteaus, sundry Harness, Baskets, Garden Pots, Tools, and other effects.—May be viewed, and Catalogues had, prior to the sale, on the premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

ISLINGTON NURSERY.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, BUILDERS, AND OTHERS

MESSRS. PROTHEROE AND MORRIS are instructed, by Mr. G. Smith, to offer to public competition by Auction, on the premises, on MONDAY, October 13th, and three following days, in consequence of the Land being let for building, the whole of the valuable NURSERY STOCK, comprising several thousand scarlet, white, and Hybrid Rhododendrons, Ghent, and other Azaleas, variegated and green Hollies, of various sizes, in considerable quantities, several thousand Aucuba japonica, from 1 to 4 feet; a large quantity of fine Mulberries of different ages, many of which are fine bearing trees, &c. May be viewed prior to the sale.—Catalogues had on the premises, of the principal Seedsmen in London, and of the Auctioneers, American Nursery, Leytonstone, Essex.

IMPORTANT SALE OF NURSERY STOCK, GREENHOUSES, HOTHOUSES, &c., FAIRFIELD NURSERY, LONDON ROAD, LIVERPOOL.

MESSRS. PROTHEROE AND MORRIS have received instructions from Mr. Thomas Whalley, to sell by Auction without reserve, on TUESDAY, 21st October, and following days, in consequence of the Land being sold to a Building Company, the whole of the valuable NURSERY STOCK, comprising a large quantity of Evergreens, including a great number of Scarlet Hybrid Rhododendrons, very fine specimen plants, Ornamental Trees, Standard and Trained Fruit Trees, Standard and Dwarf Roses, Hothouse and Greenhouse Plants, &c.; also a quantity of well-shaped Beech Hedges, 8 to 10 feet high, which will move with safety; together with large Thorn, Box, Privet, and other Hedges of various sizes. This stock is well worthy the attention of gentlemen or public bodies, intending to plant this season, as it is well grown and in fine condition. Arrangements may be made to leave the purchases on the ground, free of expense, for some time, to suit the convenience of those who may not wish to plant immediately. There is a large Conservatory, three Hothouses, a 9-light Brick Pit, with Flue, &c.; also a quantity of Frames, hand-glasses, &c., full particulars of which will be given in the Catalogue, which may be had on the 6th October, free, by post, on receipt of six postage stamps; at the Nursery; or at the Seed-shop, 14, St George's-crescent, Liverpool; also of the Auctioneers, Leytonstone, Essex. The whole may be viewed any day, except Sunday, from 8 A.M. to 6 P.M.—N.B. The "Old Swan" omnibuses pass the Nursery every half hour.

THE COLLECTION OF RARE AND VALUABLE ORCHIDACEOUS PLANTS AT KNOWSLEY, THE PROPERTY OF THE LATE RIGHT HON THE EARL OF DERBY, K.G.

MR. J. C. STEVENS is honoured with instructions to Sell by Auction, in the Gardens at Knowsley, about six miles from Liverpool, on SATURDAY, 4th October, at 12 o'clock precisely, the Rare and Choice COLLECTION OF ORCHIDS, including most of the popular East Indian, South American, Mexican, and African varieties. The Plants are all well established and in fine health, and may be viewed the day before the Sale, by applying to Mr. JOHN JENNINGS, at the Gardens, Knowsley; and Catalogues had there and of Mr. J. C. STEVENS, 38, King-street, Covent Garden, London. The Huyton Station on the Liverpool and Manchester Railway is about two miles from Knowsley.

TO ZOOLOGISTS.—KNOWSLEY PARK, NEAR LIVERPOOL.—NOTICE OF SALE, BY AUCTION, OF THE RENOWNED MENAGERIE AND AVIARY, FORMED BY THE LATE RIGHT HON. THE EARL OF DERBY, K.G., PRESIDENT OF THE ZOOLOGICAL SOCIETY OF LONDON.

MR. J. C. STEVENS is honoured with instructions from the Executors of the late Noble Earl, to sell by public Auction, on the premises, Knowsley, 6 miles from Liverpool, on MONDAY, October 6, and many following days, the whole of the LIVE ANIMALS AND BIRDS contained in the KNOWSLEY MENAGERIE, excepting only the five Eland Antelopes, selected by the Zoological Society of London, and one specimen, or series, to be selected by her Majesty, in pursuance of a desire expressed by the late Earl. This collection is admitted by Zoologists to be the finest extant; it numbers upwards of 1600 examples, including an unique collection of the rarest Antelopes, Deer, Indian Cattle, Zebras, Llamas, Alpacas, &c., which are particularly deserving the attention of Noblemen and Gentlemen, as ornamental specimens for the Park.—May be viewed, by Catalogues (price 5s. each), to admit one person, only, to the view, on Monday, the 29th inst., or either of the five following days; these may be had by persons intending to purchase, at the Office, Knowsley Hall; and of Mr. J. C. STEVENS, 38, King-street, Covent-garden, London.

NEAR MANCHESTER.

IMPORTANT SALE OF A GENERAL NURSERY STOCK

MESSRS. W. D. FULLALOVE AND BROTHER have received instructions from Mr. T. D. Watkinson, to submit to public competition next THURSDAY and FRIDAY, October 2d and 3d, on the premises, Edge-lane, Stretford, in consequence of the greater portion of his land being sold for building upon, his truly valuable NURSERY STOCK.—Catalogues may be had on application to the Auctioneers, King-street, Manchester.

OFFICE, No. 3, WHITEFRIARS-STREET, LONDON.

STANHOPE NURSERY, GLOUCESTER-ROAD, OLD BROMPTON.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, BUILDERS, AND OTHERS ENGAGED IN PLANTING

MR. J. RAWLINGS has received instructions from Mr. Wm. Siggers to submit to public competition, by Auction, on the premises, as above, on MONDAY, October 6, and following days, at 11 o'clock each day (in consequence of the Lease having expired), the whole of the valuable NURSERY STOCK, consisting of many thousands very fine Aucuba japonica, Laurel, Laurustinus, Yew, Arbor Vitæ, Holly, &c.; Fruit and Forest Trees, American Plants; Standard, Dwarf, and Pillar Roses; Irish Ivy, some very large Camellias and Scarlet Rhododendrons in pots, &c. Also a handsome Chesnut Mare, a capital light Spring Van, with top complete and other effects.—May be viewed prior to the Sale Catalogues (6d. each, returnable to purchasers) may be had on the premises; of the principal Seedsmen; and of the Auctioneer, 50, Hoxton-square; and Ebenezer Nursery, Shacklewell, London.

N.B. The whole of the Greenhouse Plants, Greenhouses, Utensils in Trade, &c., will shortly be submitted to public competition, of which due notice will be given.

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits, very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

PARADISE NURSERY, HORNSEY-ROAD, ISLINGTON.

THIS Desirable NURSERY TO BE LET, or the LEASE TO BE SOLD, in consequence of the Proprietor being about to retire from the Nursery Business. With immediate occupation. The whole may be taken at a valuation, or by private contract.—Apply personally, or by letter, to W. J. PAMPLIN, on the premises, opposite the new intended Finsbury-park.

PARTNERSHIP.—WANTED, a PARTNER in the SEED and FLOWER BUSINESS, situated in a central part of the west-end; well worthy the notice of anybody who wishes to embark in the above business.—Direct, prepaid, to Lemon, Office of this Paper.

On October 1st

"KNOW THYSELF."

THE SECRET ART of DISCOVERING CHARACTER from HANDWRITING is still practised by Mr. ELLISON with astonishing success. His startling revelations of the mental and moral qualities, talents, and defects of his applicants fill the four pages of a sheet of paper, the style of description differing from anything yet attempted. Test this by sending any specimen of the writing of yourself or of those in whom you are interested (inclosing 14 postage stamps), addressed to Mr. E. ELLISON, Professor of Graphiology, 151, Strand, London.

THE GREAT EXHIBITION.—HINTS TO VISITORS.—Among the tens of thousands who will grace the Industrial Fair, every nation will contribute bright samples of its youth, beauty, and fashion. The frequenters of the Ball, the Public Assembly, and the Promenade, will find both personal comfort and attraction promoted by the use of ROWLAND and SONS' valuable aids; and what better mark of esteem can be offered to friends on their return home, as a memento of the Great Exhibition, than a packet of

"ROWLANDS' UNIQUE DISCOVERIES."

ROWLANDS' MACASSAR OIL,

For the growth, and for preserving, improving, and beautifying the Human Hair.

ROWLANDS' KALYDOR,

For improving and beautifying the Skin and Complexion, eradicating all Cutaneous Eruptions, Sunburn, Freckles, and Discolorations, and for rendering the Skin soft, clear, and fair.

ROWLANDS' ODONTO,

Or PEARL DENTIFRICE, for preserving and beautifying the Teeth, strengthening the Gums, and for rendering the Breath sweet and pure. Price 2s. 9d. per box.

BEWARE OF SPURIOUS IMITATIONS.

The only GENUINE of each bears the name of "ROWLANDS'," preceding that of the article on the Wrapper or Label.

Sold by A. ROWLAND and SONS, 20, Hatton-garden, London; and all Chemists and Perfumers.

Printed by WILLIAM BRADBURY of No. 13, Upper Woburn-place, in the parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Bun-ch row, Stoke Newington, both in the County of Middlesex, Printers, at their Office in Lombard-street, in the Precinct of Whitefriars, in the City of London, and published by them at the Office, No. 5, Charles street, in the parish of St. Paul's, Covent-garden, in the said County where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, September 27, 1851.

RENDLE'S LIST OF NEW GERANIUMS will be found in the columns of this Paper, page 578, in the Number for September 13, 1851.
WILLIAM E. RENDLE, Florist to her Majesty, Plymouth.

ROSE NURSERIES, HERTFORD.
E. P. FRANCIS'S New Descriptive Catalogue of ROSES for the ensuing season is now ready for delivery, and will be forwarded gratis upon application.

TO FLORISTS, AMATEURS, AND GARDENERS.
M. WOOLLARD begs most respectfully to announce her intention to dispose of the entire Stock of FLORIST FLOWERS belonging to her late husband, consisting of a large collection of fine healthy plants of Auriculas; a very valuable collection of Ranunculuses; and all the new and best varieties of Carnations, Picotees, and Pinks.
Royal William Inn, Ipswich, Suffolk.

PINE-APPLE PLANTS ON SALE.
9 Plants, showing Fruit.
7 Succession Plants, 2 years old.
10 do. do. 1 year old.
10 do. do. 6 months.
The above are very strong plants, and clean of the Black Jamaica sort, and to be sold by private contract. The price may be obtained by applying to Mr. GEORGE ROGERS, Seedsman and Florist, Uttoxeter, Staffordshire.

GERANIUMS.
J. SCOTT, FLORIST, Bathford, can supply the following Geraniums, good plants, including package and hamper, at 1l. per dozen:—Alderman, Conspicuum, Constance, Emily, Fireball, Field-Marshal, Gipsy Bride, Morgan's Hecla, Loveliness, Foquet's Magnificent, Moresco, Narcissus, Nonsuch, Prince of Orange, Princess Royal, Rosalind, and Satisfaction.
Gipsy Bride, 15s. per dozen.
The following at 12s. per dozen:—Alonzo, Armada (improved) Aspasia, Belle of the Village, Brilliant, Crusader, Lalla Rookh, Meleager, Norah, Ondine, Rolla, Salamander, Star, Victory, and Virgin Queen.
Variegated Flower of the Day, 1s. 6d each, or 12s. per doz.
Cineraria, Lady Hume Campbell, 2s. 6d each, or 24s. per doz.
The above are strong healthy plants.
A remittance expected from unknown correspondents.

TWELVE FIRST-RATE SHOW PELARGONIUMS FOR TWO GUINEAS.
JOHN DOBSON begs to inform the public that he is now sending out his unequalled set of 12 PELARGONIUMS for 2l. 2s., in fine strong plants. No charge for hamper or package. Carriage free to London. Persons desirous of selecting their own plants from the stock may do so. Trains leave Waterloo Station every hour. Post-office orders are respectfully requested as soon as the plants are received, made payable at Brentford. Catalogues may be had by enclosing one postage stamp.—Woodlands Nursery, adjoining the Railway Station, Isleworth, Middlesex.

CONWAY'S NEW CALCEOLARIA—"CRIMSON KING," a very choice, compact, shrubby variety, profuse bloomer, dwarf habit, a good plant for bedding as well as for pot culture; strong plants, 5s. each.
A large assortment of all the New Scarlet Pelargoniums.
MARY CONWAY, Earl's Court Nursery, Old Brompton, London.

AMERICAN ALOE.—A splendid Specimen of the above-named Plant TO BE DISPOSED OF, 6½ feet high, and of considerable substance.—Apply to J. DADFORD, Northampton.

HOLLYHOCKS.
JOHN CHATER AND SON respectfully inform the public that their Catalogue of new and superb Hollyhocks is now ready, and may be had on application to J. CHATER and SON, Nurseries, Haverhill, Suffolk.
J. C. and SON are prepared to send out their four superb Seedling PANSIES at 5s. each:—Beauty of Haverhill, Rotunda, Climax, and Sparkler. These are first-rate sorts.
HOLLYHOCK SEED, 2s. 6d. to 5s. per packet.
PANSY SEED, 1s. 6d. to 2s. 6d. per packet.

CARNATIONS, PICOTEES, PINKS, PANSIES, HOLLYHOCKS, &c.
CHARLES TURNER'S extensive and carefully selected collections of the above are in the most robust health this season. Strong plants are now ready for sending out, including several new varieties that have established themselves as first-class flowers at the principal exhibitions.
CARNATIONS, 24s. and 30s. per dozen pairs.
PICOTEES, do. do.
PINKS, 12s., 18s., and 24s. do.
PANSIES, 12s., 18s., and 24s., per dozen.
HOLLYHOCKS, 20s. and 30s. do.
The selection to be left to C. TURNER.
It should be stated if they are required for exhibition or other purposes, accompanied with a list of the sorts already grown, when a judicious selection may be depended on. A Descriptive Catalogue will shortly be ready.—Royal Nursery, Slough.

DUTCH FLOWER ROOTS.
RENDLE'S LIST OF DUTCH BULBS will be found in the columns of this Paper, front page, in the number for September 27, 1851. The prices are very low. Descriptive Catalogues on application to WILLIAM E. RENDLE, Florist to her Majesty, Plymouth.
*The Hyacinths are particularly large and handsome. Most excellent kinds can be had at 6s. per dozen.*

PELARGONIUMS.—Now ready, 12 of the following for 42s., Carriage Free to London:—
Alderman, Alonzo, Constance, Christabel, Cuyp, Emily, Exactum, Florabunda, Gipsy Bride, Goliah, Knight of Avenal, Loveliness, Magnificent, Melissa, Narcissus, Old Story, Pride of the Isles, Prince Arthur (Pontey), Prince of Orange, Rosalind, Rowena, and Virgin Queen.
C. TURNER'S Descriptive Catalogue is now ready, including those fine new Seedling Pelargoniums raised by E. Foster, Esq., and G. W. Hoyle, Esq.—Royal Nursery, Slough, near Windsor.

SUPERB HOLLYHOCKS.
R. B. BIRCHAM, Hedenham Rosary, Bungay, Suffolk, begs to state that his Descriptive CATALOGUE of the above splendid flowers is now ready, containing all the best in cultivation, and including some first-rate Seedlings.
R. B. B. begs to offer strong ground roots, selected when in bloom, from some thousands of seedlings; these are fine double flowers and splendid colours, and will prove a superior class of flowers for the border and shrubbery; 9s. per dozen.
A Descriptive Catalogue of the best Roses in cultivation, including upwards of 300 of the best hardy varieties. R. B. B. will be happy to forward the above lists on prepaid application. Package carefully attended to; extra plants included, to compensate for distant carriage. Carriage paid to London per Norfolk railway.

THE BLACK PRINCE STRAWBERRY, price 6s. per 100, box included. It has proved itself to be the earliest these five years, good in flavour, and a tremendous bearer, and the best for preserving: has taken six prizes. Same time, a pamphlet, of 36 pages, on "Market Gardening round London," explaining everything, price 1s. 6d., or by post 1s. 8d.; also a pamphlet of 56 pages, containing the "Belgian Prize Essay on the Potato, and 12 other first-rate Fruits and Vegetables," price 2s., or by post, 2s. 4d. Post-office orders on Camberwell Green.—JAMES CUTHILL, Camberwell, near London.

THE FINEST NEW ROSES OF THE SEASON.
HYBRID PERPETUAL QUEEN VICTORIA (PAUL'S).—This is unquestionably the finest New Rose of the season; it is a seedling from "La Reine," of which it is so exact a copy in every respect, save colour, that it has been designated by some the "WHITE LA REINE." The ground colour is white, overlaid with the most delicate hue of pink, perfectly wax-like in appearance, and distinct from every other. Plants, in November, 10s. 6d each, with the usual discount to the Trade when three are ordered at once.
CLIMBING PERPETUAL ROBERT BURNS (PAUL'S.)—Flowers light vivid carmine, sometimes edged with purple, large, equal to Chenedole in colour; like it not very double, but possessed of the additional advantage of flowering in the autumn. Desirable on account of its distinct and glowing colour, and a splendid autumnal climber. Plants, in November, 7s. 6d. each.
N.B. Each of these Roses has obtained a 1st Class Certificate from the National Floricultural Society; the former has also received the same from the Royal South London Floricultural Society. Also a fine collection of Hollyhocks now in bloom.
A. PAUL and SON, Nurserymen, Cheshunt, Herts.

THE MOUNTAIN OF LIGHT, a new variegated GERANIUM, of dwarf habit, and free growth. The centre of the leaf is deep green, with a broad margin of pure white. The truss is of medium size, the pips very round, and the colour the most intense scarlet. It is a very free bloomer.
JOHN AND CHARLES LEE intend sending out this desirable variety (which eclipses all former introductions in this class), on the 31st instant. Price 10s. 6d. each. Early orders are requested, as the stock is limited.
Nursery, Hammersmith.

DOWNIE AND LAIRD are now prepared to send out their superb White Sweet-scented PHLOX "ANTAGONIST," which they warrant to be the finest in its class. It has received two First Class Certificates, and been exhibited at the principal Flower Shows in and around Edinburgh throughout the season, and received the highest commendations. It has also been twice submitted to the Editor of the Gardener and Farmers' Journal, and the following is his opinion of it:—
Gardener and Farmers' Journal, 19th July.—"Messrs. DOWNIE and LAIRD,—Your Phlox 'Antagonist' is the best we have seen in its class. It is highly perfumed, and decidedly of first-rate form. We congratulate you on your possession of the stock of so desirable a variety." And again, in the same Paper, 9th Aug.—"We received your splendid spike of Phlox 'Antagonist.' We pronounce it the finest of its class we have ever seen. The purity of the white, the substance of the pips (which are round, flat, and smooth), together with its unusual perfume, renders it a truly desirable addition to the most *recherché* collection."—Plants 5s. each; the usual allowance to the Trade.
It can also be had of the following Nurserymen in England, viz.—

| | |
|---|---|
| Low & Co., Clapton, London. | Bragg, Slough. |
| Fairbairn, Clapham, London. | Laing, Twickenham. |
| Henderson, Wellington-road, London. | Paul & Son, Cheshunt. |
| Ivery, Peckham, London. | Jackson & Son, Kingston. |
| Smith, Hornsey-road, London. | Wood & Son, Maresfield. |
| Salter, Hammersmith, London. | Pearson, Chilwell, Nottingham. |
| Turner, Slough. | Wood, The Coppice, Nottingham. |

Edinburgh, Oct. 4.

PINE PLANTS FOR SALE.—The different varieties of BLACKS and QUEENS, warranted clean and well rooted.—Apply to W. DAVIES, Starch Green, Hammersmith, near London.

ROYAL VICTORIA AND ALBERT MELONS.
J. WEEKS AND Co., King's-road, Chelsea, have just received from their collector a small *sweet scented* Melon, of exquisite beauty, and most delicious flavour, which they purpose calling the ROYAL VICTORIA. Also a very splendid large Melon named the ROYAL ALBERT, which for size, weight, and flavour, cannot be surpassed. Packets of these unique Melons can be supplied at 2s. 6d. each, free by post.

NEW STRAWBERRY PLANTS.—
MYATT'S EARLY SURPRISE ... 18s per 100.
ELEANOR ... ... ... 4s. ,,
KITLEY'S GOLIAH ... ... ... 5s. ,,

DUTCH FLOWER ROOTS.
J. G. WAITE has yet on hand a large quantity which he will supply on better terms than any house in the Trade.
Catalogues to be had on application—181, High Holborn.

ROSES.—THE DESCRIPTIVE CATALOGUE OF ROSES for the present autumn, by THOMAS RIVERS, is now ready for delivery. It contains a selection only of the choicest Roses, both old and new. Some of the most eligible varieties for beginners are pointed out. Sent free for two postage stamps.
Also, a CATALOGUE of FRUITS, with full descriptions, and many hints for their culture, for four postage stamps.
Nurseries, Sawbridgeworth, Herts.

DUTCH FLOWER ROOTS AT REDUCED PRICES.
HYACINTHS, 100 roots, in 50 fine sorts, named, for 50s.
Ditto, not named, but in separate colours, 21s. per 100.
POLYANTHUS NARCISS, choice sorts, named, 4s. per doz.
TULIPS, early sorts, for pots or growing in masses, 7s. per 100.
CROCUS, DUTCH, mixed all colours, 10s. per 1000.
The above (*which can be confidently recommended*) and every other kind of Bulb, may be had of WILLIAM DENYER, Seedsman, &c., 82, Gracechurch-street, London, near the Spread Eagle. A descriptive priced Catalogue may be had on application.

VIOLETS.
TILEY'S VIOLA ARBOREA, OR PERPETUAL TREE VIOLET (TRUE).—In answer to numerous inquiries for the above, and great satisfaction given by the plants sent out last season, by EDWARD TILEY, he begs to state that he has this year a fine stock of the above beautiful Double Violet now to dispose of, which he can highly recommend, this being the proper time for making beds or potting. They are beautifully scented; the blooms are as large as the Double Blue Hepatica; they bloom freely from August till the end of May, and are perfectly hardy. Twelve of these plants grown in pots will scent a large greenhouse; and a small bed, 9 feet long by 3 feet wide, will be sufficient to furnish a family with bouquets, the whole of the winter and the spring. They should be planted in rather a dry situation and a loose soil, as the Violet will thrive and bloom finer than in wet or clay borders.
E. T. has been informed by the gentleman that introduced it into this country, that he has seen them growing in the thickets of Persia to the height of 4 feet, with large bushy heads to them, and hundreds of blooms on them at the same time. Large bushy plants, 6s. per dozen; smaller ditto, 3s. per dozen, or 1l. per 100. Any quantity of the above will be sent postage and package free.

STRAWBERRY PLANTS.
The undermentioned first-rate varieties are now ready to send out:—
Myatt's Surprise, sent out first time last season, 1l. per 100, or 3s per dozen.
Prince Arthur, do. do, 1l. per 100, or 3s. per dozen.
Myatt's Eleanor, the best and latest bearing Strawberry in cultivation, 5s. per 100.
Goliah, very fine ... ... ... ... 3s. per 100.
British Queen, do. ... ... ... 5s. ,,
Alice Maud, do. ... ... ... ... 3s. ,,
Black Prince, very early ... ... 5s. ,,
Prolific, very fine and early ... ... 5s. ,,
Cremont's Perpetual, or double-bearing Strawberry, 12s. per dozen, or 4l. per 100.
Trollop's Victoria, 12s. per dozen, or 4l. per 100.
The above are strong and well-rooted plants, such as will insure satisfaction. Any of the Strawberries that are priced, per dozen, can be sent free by post; also those priced, per 100, will be sent package free.
Fine Giant Scarlet Brompton Stocks, Plants that have been all pricked out, 2s. 6d. per 100.
Also, some fine Antirrhinums, all saved from striped and spotted varieties, such as will give every satisfaction, and bloom early next spring, 5s. per 100.
Fine Sweet Williams, such as will bloom next season, saved from 50 distinct varieties (the plants are strong and good), 5s. per 100, or 1s. per dozen. Can be sent by post with any of the above.

WINTER CUCUMBER.
Lord Keynon's Favourite, the best variety for winter cultivation, 2s. 6d. per packet.
A remittance is expected by Post-office order, or the amount in penny postage stamps.
EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Churchyard, Bath, Somersetshire.

## FANCY PELARGONIUMS.—SEEDLINGS OF 1850.

W. P. AYRES begs to announce to his Friends and the public that, on and after the 20th proximo, he proposes to send out the following SEEDLING FANCY PELARGONIUMS, which he flatters himself will be found distinct and very good.

To test their worth, he is willing to show six of them against any six sent out this autumn, by one person, for 10 guineas, or he will take 10 guineas to five, and allow six to be selected from all the Seedlings to be sent out this season. This challenge to stand open until January, 1852.

W. P. A. also wishes to intimate that, at the Metropolitan exhibitions in June and July, 1852 (due particulars of which will be announced), he proposes to give for the best six Plants selected from the following list, and grown in 6-inch pots,

TWO SILVER CUPS, VALUE FIVE GUINEAS EACH;

the person who obtains the CUP in June not to be eligible to compete in July.

The Plants marked thus * will not, in consequence of the large demand, be ready to send out until April, 1852; but all orders received previous to that time will be executed in strict priority.

⁂* Every purchaser of PELARGONIUMS to the amount of one guinea will receive gratis a copy of the "Fancy Pelargonium; its Origin and Culture" (beautifully illustrated). By W. P. AYRES, C.M.H.S., &c.

*1. ADVANCER.—This variety, to adopt the language of a floricultural critic, "is worthy of its name," and may be described as the finest formed Pelargonium yet raised, the outline being perfectly circular, and the petals of great width and good substance. In colour the upper petals are rich purple mulberry, with a slight light margin; lower petals blush, pencilled with purplish crimson, and a distinct white eye. It is a plant of fine habit and strong constitution, and must become one of the most important show varieties. It obtained a second prize at the Seedling trial Exhibition at the Royal Botanic Society in June, and a First Class Certificate from the National Floricultural Society the following day. 1*l.* 11*s.* 6*d.*

2. ALBONII SUPERB.—A decided improvement upon Albonii, the colour being richer and better defined, the white purer, the flower superior in form, equally profuse, and the plant constitutionally strong. The upper petals are rich crimson purple, with a well-defined margin of white; lower petals white, faintly pencilled with crimson; truss large, and well above the foliage ... ... ... ... ... 10*s.* 6*d.*

*3. BRUNETTE.—A dwarf distinct plant, with remarkably glossy foliage, and produces flowers in such abundance, as, in the early part of the season, and until the plant gets strong, to render it necessary to thin some of the flower trusses out to allow the others to develope themselves. Upper petals, rich brownish chocolate, belted with flesh-colour; lower petals, deep flesh-colour, veined with rich maroon; light centre, and a finely formed and cupped flower of considerable substance. Truss large, and well above the foliage ... ... 10*s.* 6*d.*

4. CALIBAN.—This fine flower is figured in the "Gardeners' Magazine of Botany," vol. 2, p. 137. It is of great substance, and is nearly perfect in form, the flower being very circular and nicely cupped. The upper petals are rich plum colour, with a broad belt of white; lower petals white, spotted and slightly clouded with rich mulberry. The truss is large, and stands well above the foliage. In habit the plant is strong and robust; the foliage clean, and the flowers are constant and produced with great freedom. It obtained an equal second prize with "Richard Cobden," at the trial exhibition of seedlings in the Royal Botanic Garden, in June, 1851, and a certificate from the National Floricultural Society in the same month ... ... ... ... ... ... ... ... 1*l.* 1*s.*

5. CELESTIAL.—This is a plant of remarkably strong habit, and produces in great profusion large trusses of very clean rosy crimson flowers. It is a very late variety, and will be found suitable for late exhibitions. The upper petals are rich rosy crimson, slightly pencilled with pale lilac towards the centre, and margined with white, lower petals veined with rosy purple. A flower of good form, great freedom of growth, and will become a general favourite ... ... ... 1*l.* 1*s.*

*6. CONSPICUUM.—This is perhaps one of the brightest and most distinct varieties in cultivation, producing with remarkable freedom rich masses of rosy crimson flowers distinctly suffused with purple; the lower petals have a belt of crimson purple, and the whole flower has a broad and distinct margin of clear white. It is a plant of excellent habit and produces flowers with great freedom, the flowers hanging on until quite dried up. For decorative purposes it will be found quite worthy of its name, and also a first-rate plant for exhibition ... ... ... ... ... ... ... 1*l.* 1*s.*

7. ELECTRA.—A crimson purple flower of great smoothness, the petals being margined with white and shaded with lilac. Habit strong and robust, and produces flowers with great freedom ... ... ... ... ... ... ... 7*s.* 6*d.*

8. FORMOSISSIMUM.—The leading flower of the season, the same plant having in 1850 and 1851, obtained five first-class prizes, viz.:—in June 1850, a certificate at the Royal Botanic Society, and a certificate at the Royal South London Floricultural Society in the same month. In 1851, a first-class certificate at the National Floricultural Society in May; a certificate at the Royal Botanic Society in the same month, and the first prize in its class at the seedling trial exhibition at the Royal Botanic Society in June. It is figured with No. 3 in the "Gardeners' Magazine of Botany," and also in the "Florists' Guide." It is a plant of compact and luxuriant habit, producing throughout the season a regular succession of very fine flowers. The upper petals are rich crimson suffused with violet, and distinctly and broadly margined with clear white; lower petals white, belted with rosy crimson. It is a flower of large size, fine substance, and first-rate form, and being very constant, may be depended upon at all times. Truss large and well above the foliage. ... ... ... 1*l.* 11*s.* 6*d.*

9. GIPSEY QUEEN.—Though not quite perfect in form, this is a constant and very showy variety, being in every respect superior to "Hero of Surrey," with clearer colour and larger trusses. The habit is good and strong, the flowers very constant, and are produced in great profusion. Upper petals rich plum colour shaded with mulberry, and light lilac margin; lower petals white, spotted and pencilled with purple. Obtained the third prize in the same class with "Caliban," at the seedling trial exhibition at the Royal Botanic Society in June, and a certificate at the National Floricultural Society in the same month. Will be found excellently adapted both for exhibition and home decoration. ... ... ... 1*l.* 1*s.*

*10. KENTISH BEAUTY.—A brilliant scarlet crimson flower suffused with rich violet; lower petals delicate flesh colour, spotted with crimson and margined with lilac. This is a rich and very brilliant flower, perhaps the brightest colour yet to be sent out. The habit is good and the flowers are produced in great profusion, but in the early part of the season; sometimes they do not open freely, especially upon weak plants; therefore remove the flowers to gain strength, and thin a few trusses out occasionally. It is a flower of good form, and doubtless the most brilliant of its class ... ... 1*l.* 1*s.*

11. MIRANDA.—The ground colour of this remarkable variety is delicate rosy salmon, pencilled with lilac, and shaded towards the margin; lower petals a little lighter, and slightly pencilled. The habit of the plant is good and free; flowers clear above the foliage, fine form, good substance, very constant and very distinct. Obtained the second and *only* prize at the seedling trial exhibition at the Royal Botanic Society in June, beating upwards of a dozen varieties, and received a certificate at the National Floricultural Society in the same month ... ... ... ... ... ... 1*l.* 1*s.*

*12. PAINTED PET.—A plant worthy of its name, but, like many other pets, rather more delicate in constitution than is desirable. It is figured in the "Gardeners' Magazine of Botany" with Nos. 3 and 7, and is perhaps the prettiest and most distinct flower of any that I have raised. The upper petals are purplish crimson, shaded with violet and margined with white; lower petals spotted with violet purple, which, late in the season, has quite a blue tinge. The singular satiny texture of this flower gives it a peculiar charm. Flowers of good form and substance, and are very profusely produced, but the habit is slight, and the constitution delicate. As the stock is limited, early orders only will secure plants ... 1*l.* 5*s.*

13. SAMBO.—A plant remarkable for the great profusion with which it produces flowers, from 50 to 60 fully-expanded flowers having several times in the season been counted in a space 9 inches square. The ground-colour is rich purplish crimson, the upper petals being nearly black and of a rich velvety texture. The plant is of good habit and free growth, and will be found an excellent variety for bedding or for the greenhouse stage ... ... ... ... ... 7*s.* 6*d.*

⁂ For every set ordered, a plant of one of the Guinea kinds will be given over.

W. P. A. has also much pleasure in intimating that he has a stock of nearly 5000 plants of the leading named Fancy Pelargoniums, all in vigorous health, and that he can supply strong established plants at from 12*s.* to 100*s.* per dozen—the selection being left to himself.

His Descriptive Catalogue of Seedlings, with cultural hints, is now ready, and will be forwarded upon prepaid application.

Brooklands Nursery, Blackheath, Kent, October 4th, 1851.

---

SEED TRADE.

J. G. WAITE begs to inform the Trade generally that he has the largest and best STOCK of SEEDS in the kingdom, which will enable him to supply his friends on better terms than any other house in the trade. Prices to be had on application at the Seed Establishment, 181, High Holborn.

---

NEW PEAS, &c.—EARLY PARAGON, EARLY WONDER, AND CONQUEROR.

FAIRBEARD'S WILL WATCH, fine large Wrinkle Marrow, 4 feet, the best of its class.

NE PLUS ULTRA. Blue Pods.

WAITE'S KING OF MARROWS.

HAIRS' DWARF BLUE MARROW, the best dwarf Wrinkle Pea grown.

And many others will appear in the list of Prices.

FAIRBEARD'S NEW EARLY DWARF PROLIFIC LONG-POD BEANS.

The above to be had at J. G. WAITE'S Seed Establishment, 181, High Holborn.

---

RED LODGE NURSERY GROUNDS, North Stoneham; SEED WAREHOUSE and FLORICULTURAL GARDENS, No. 181, High-street, near the Bar Gate, Southampton.

W. ROGERS, SEN., NURSERYMAN and CONTRACTING PLANTER, begs to inform the Public and those interested in Planting that he intends selling at very reduced prices, the fine Stock of FRUIT, FOREST, ORNAMENTAL TREES and SHRUBS (extending over 60 acres of land) in the forthcoming planting season, priced catalogues of which may be had, wherein will be enumerated all the newly-introduced hardy CALIFORNIAN and CHINESE SHRUBS, CONIFERÆ, RHODODENDRONS, and ROSES, which are added to the stock and cultivated as soon as they appear, it being his determination that these old-established nursery grounds shall continue to merit the patronage of the nobility and gentry so liberally conferred upon him for the last 40 years.

A Gardeners' and Land Stewards' Registry is kept at his office in the town, where men of experience and ability may be always obtained.

The following will be found particularly fine, and in great abundance:—Larch (Scotch), Spruce, Pineaster, and Sea Pine, Fir, Hazel, Oak Quicksets, Mahonia (for cover), and Rhododendrons of all sizes, from 4 inches, 40*s.* per 1000, to 2, 3, and 4 feet, 10*s.* to 30*s.* and 40*s.* per 100; Abies Douglassii, 2 feet, 30*s.* per dozen, and 2 to 3 inches, 5*l.* per 100, or 18*s.* per dozen. Double Camellias, 12*s.* per dozen; Single Camellias, fit for working, 30*s.* to 40*s.* per 100; Dwarf Boursault Rose stocks strong), 6*s.* per 100.

---

SANGSTER'S NEW EARLY No. 1 PEA.

HAY, SANGSTER, AND CO., in submitting the above valuable PEA to the public, can recommend it with the greatest confidence, as the largest podded and best Early Pea known, and of first-rate quality; height, 2 feet. Price 2*s.* 6*d.* per quart.

York Regent Potatoes, from prepared cuttings, 6*s.* per bush. Cambridge Radical do. (a first-rate second early) 6*s.* do. Early Oxford do., 10*s.* 6*d.* do. Early Ebrington Kidney do., 10*s.* 6*d.* do. Early Ash-leaf Kidney do., 10*s.* 6*d.* do.

Post-office orders to be made payable at the Borough Post-office to HAY, SANGSTER, and Co., Nursery and Seedsmen, Newington Butts, London. One-bushel hampers and booking, 1*s.* 6*d.*; two-bushel, 2*s.* 6*d.* Sacks, 2*s.* 6*d.* each.

---

DUTCH HYACINTHS, per doz., 6*s.* to 12*s.*

Or an assortment of three dozen, best sorts, for 16*s.* 6*d.*

| | | |
|---|---|---|
| Double Roman Narcissus ... ... ... per doz. | 3 | 0 |

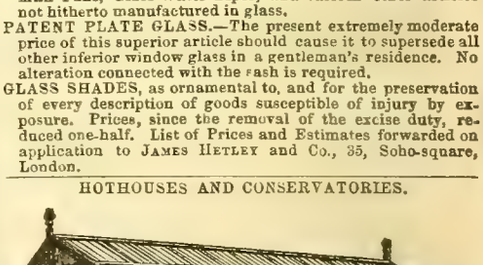
| 8 ,, 6 ,, | 10 ,, 8 ,, | 3½*d.* | ,, 1 0 10 |
| 10 ,, 8 ,, | 12 ,, 9 ,, | 2¾*d.* | ,, 1 2 11 |

Larger sizes, not exceeding 40 inches long.

16 oz. from 3*d.* to 3½*d.* per square foot, according to size.
21 oz. ,, 3½*d.* to 5*d.* ,, ,, ,,
26 oz. ,, 3¾*d.* to 7½*d.* ,, ,, ,,

PATENT ROUGH PLATE, THICK CROWN GLASS, and PATENT PLATE GLASS for Horticultural purposes, at reduced prices, by the 100 square feet.

GLASS TILES AND SLATES made to any size or pattern, either in Sheet or Rough Plate Glass.

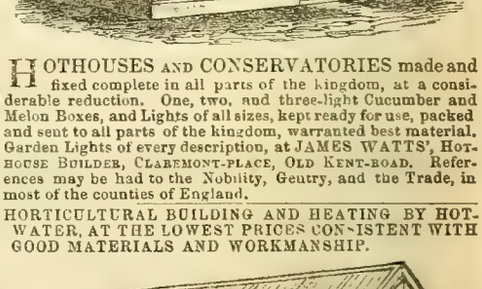


Propagating Glasses, Bee-hive Glasses, Cucumber Tubes, Glass Milk Pans, Glass Water Pipes, and various other articles not hitherto manufactured in glass.

PATENT PLATE GLASS.—The present extremely moderate price of this superior article should cause it to supersede all other inferior window glass in a gentleman's residence. No alteration connected with the sash is required.

GLASS SHADES, as ornamental as, and for the preservation of every description of goods susceptible of injury by exposure. Prices, since the removal of the excise duty, reduced one-half. List of Prices and Estimates forwarded on application to JAMES HETLEY and Co., 35, Soho-square, London.

---



HOTHOUSES AND CONSERVATORIES.

HOTHOUSES AND CONSERVATORIES made and fixed complete in all parts of the kingdom, at a considerable reduction. One, two, and three-light Cucumber and Melon Boxes, and Lights of all sizes, kept ready for use, packed and sent to all parts of the kingdom, warranted best material. Garden Lights of every description, at JAMES WATTS', HOTHOUSE BUILDER, CLAREMONT-PLACE, OLD KENT-ROAD. References may be had to the Nobility, Gentry, and the Trade, in most of the counties of England.

---

HORTICULTURAL BUILDING AND HEATING BY HOT-WATER, AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.

GRAY AND ORMSON, Danvers-street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are now in a position to execute orders on the lowest possible terms.

G. & Co. have been extensively employed by the Nobility, Gentry, and London Nurserymen, and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-Water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

GOLIATH STRAWBERRY.—A Post-office order for 5s. will secure (package free) 100 strong plants of this celebrated Strawberry, or 12 plants, free by post, on receipt of 18 postage stamps. Also TROLLOP'S VICTORIA, 4l. per 100, and any of the old varieties at very low prices. The usual allowance to the trade.—JAS. KITLEY, Lyncombe Vale Nursery Bath.

DUTCH HYACINTHS for Forcing, 3s. 6d. per dozen; Best do., for Glasses, 6d. to 1s. each. Double Roman and Paper-white Narcissus, 4s. per dozen; Single and Double Due Van Thol Tulips, 2s. per dozen. Also Crocus, Iris, Jonquils, Narcissus, Anemones, and Ranunculus, of which a priced List may be had free, per post, from A. COBBETT, Italian and Foreign Warehouse, 18, Pall Mall, London.

SUPERB NEW PEA, "THE NOVEMBER PROLIFIC," supersedes all other varieties, yielding a crop of extraordinary abundance, stands the severe weather better than any others. It is of the richest flavour, and may be sown from November to July without missing a crop. Price 2s. 6d. per quart; to be had from W. HAMILTON, Seedsman, &c., 136, Cheapside, London.

☞ A liberal discount to the Trade.

WHOMES' Descriptive Catalogue of his NEW PELARGONIUMS may be had on application.
Royal Pelargonium Nursery, Windsor. Oct. 4.

HOSEA WATERER'S Descriptive Catalogue of AMERICAN PLANTS, CONIFERS, ROSES, &c., for the ensuing Autumn, is just published, and may be had on application, enclosing two postage stamps, to Mr. HOSEA WATERER, Knap Hill Nursery, Woking, Surrey.

THE AMERICAN NURSERY, BAGSHOT, SURREY.

JOHN WATERER begs to announce that he has just published a new CATALOGUE of Hardy Rhododendrons, Azaleas, Roses, Conifers, &c., and which may be obtained by enclosing two postage stamps.

*** The Colours of all the Rhododendrons worthy of cultivation are described; thus purchasers are afforded every facility in making selections.

BASS AND BROWN'S AUTUMN CATALOGUE is now ready, containing—

PART I. The New Geraniums, Fuchsias, Petunias, Verbenas, and other new and select Plants, at reduced prices.

PART II. Roses, select Evergreen and Flowering Shrubs, Climbers, Hardy Herbaceous Plants, &c.

PART III. Flower Roots, embracing splendid collections of Ranunculi, Gladioli, Early and Late Tulips, Iris, Lilies, imported Dutch Hyacinths, &c., &c.

Copies supplied on application, published complete with the newspaper stamp, to go free.
Seed and Horticultural Establishment, Sudbury, Suffolk.

VICTORIA REGIA.

J. WEEKS AND Co., King's-road, Chelsea, have great pleasure in announcing the complete success of this magnificent Aquatic, the Queen of the Lakes, GROWING IN THE OPEN AIR. The splendid flowers are now open every day, to the great admiration of all who see it. A few fine YOUNG PLANTS ARE NOW FOR SALE. Full instructions for its cultivation will be forwarded on application to J. WEEKS and Co., King's-road, Chelsea.

EARLY CABBAGE.—Stout Bedded Plants of superior true sorts, 4s. 6d. per 1000, package included, delivered free of carriage to the Edenbridge station of the South-Eastern Railway.—Address, JOHN CATTELL, Westerham, Kent. Cash or stamps must accompany orders from unknown correspondents.

FIRST CLASS GERANIUMS.—TWO GUINEA SET.

WILLIAM E. RENDLE, Plymouth, FLORIST to her MAJESTY, will supply Twelve of the following first-rate GERANIUMS for 2l. 2s., with a plant of Elliott's Surprise over.

RUNDLE'S BEAUTY OF MONTPELLIER; May Queen (Hoyle); Nectar Cup (Hoyle); Ajax (Hoyle); Rubiola (Hoyle); Isis (Hoyle); Flavia (Hoyle); Generalissimo (Hoyle); Gaiety (Foster); Corinne (Hoyle); General Jung Bahadour (Gaines); Lady Peel (Paley's, first time sending out); Candidate; Boule de feu; Village Maid; Cardinal (Hoyle); and Heartsease.

*Descriptions of* ELLIOT'S SURPRISE, *and* RUNDLE'S BEAUTY OF MONTPELLIER, *will be found in the* Gardeners' Chronicle, *Sept. 13th, page 578.*

| | s. | d. |
|---|---|---|
| Twelve excellent GERANIUMS ... ... ... | 12 | 0 |
| Twelve excellent Fancy do. ... ... ... | 20 | 0 |
| Twelve excellent Scarlet do. ... ... ... | 15 | 0 |
| Twelve excellent CINERARIAS ... ... ... | 10 | 0 |

*For names of the varieties, see page 578, Sept. 13.*

*All Orders above 2l. will be delivered Carriage Free to any Station on the Great Western, Bristol and Exeter, or South Devon Railway, or to Cork, Dublin, or Belfast. All Orders attended to in strict rotation.*

*A large Collection of BULBS has just arrived from Holland, which will be offered at very reduced prices.—Catalogues on application.*

Apply to WILLIAM E. RENDLE, Union Road, Plymouth, adjoining the Terminus of the South Devon Railway.

*SATURDAY, OCTOBER* 4, 1851.

MEETINGS FOR THE ENSUING WEEK.

TUESDAY, Oct. 7—Horticultural ..... 3 P.M.
THURSDAY, — 9—National Floricultural ..... 2 P.M.

IT is well stated in the extract which we gave last week from the Journal of the Horticultural Society, that the conditions to be observed in KEEPING FRUIT are a uniform temperature, coolness, and darkness. This seems to be the great secret in Mr. MOORMAN'S practice, which it is admitted by every body is the most successful in the neighbourhood of London. When nobody has eatable Apples and Pears left, this gentleman produces his in the highest perfection.

The plans accompanying Mr. THOMPSON'S description of this fruit-room will enable every one to construct a similar place for himself. It is obvious that a spare loft, an empty chamber, or any like place, may be cheaply and rapidly adapted to such a purpose. It is indispensable, however, that certain precautions should be taken, and that the three conditions above referred to be observed in their exact spirit.

The room should *not* be on the ground floor, because it is far more difficult to keep one cool in that position, than if raised into the air. If circumstances render a ground floor indispensable, then the access of warmth from the earth should be cut off by double floors and air passages between them.

It must be ventilated, without the admission of light, except in a very inconsiderable degree. The object of ventilation is merely to carry off the excessive moisture that accompanies fruit when first stored, or such dampness as may otherwise form.

It must be kept as cool as possible, without freezing; that is to say, it must never be warm and never cold. If warmed, the chemical changes that result in the decay of fruit are rendered more active and intense. If frozen, all flavour is destroyed. The way in which frost operates in destroying the flavour of fruit is unexplained; but the fact is certain, as was, indeed, proved in a curious way two or three years ago. A gentleman residing at Boston, U. S., wishing to send to London specimens of the famous Boston Nectarine, packed them in ice. In a very short time they arrived, plump as when gathered, with all the beautiful appearance produced by the rich and glowing colours that only form beneath such a sun as shines in the United States—but they were tasteless. In order to secure a fruit room against frost, the room is lined, and on the north roof even double lined, with wood, so as to have one, or on the north two, layers of air between the wainscoting and the outer wall. The same precaution keeps off such solar heat as would be inconvenient during autumn and winter.

In addition, in case of very cold weather, a small stove is provided, and here no doubt more attention is demanded than in any part of the arrangements. A negligent servant would be almost certain to over-heat the room one day and to let the fire out on another; or, as a matter of course, to light the fire in warm weather, and forget it in a hard frost. It is, therefore, a question whether this fireplace could not be dispensed with by a further casing of wood in the inside of the room. Half-inch boards are so cheap now that it is quite possible that an additional casing would be cheaper than a fireplace, the need of which it would obviate.

We believe no register is kept of the temperature in Mr. MOORMAN'S room, but we can hardly be wrong in saying that 40° and 50° should represent the occasional extremes, 45° being the mean.

A SMART skirmish has lately taken place between Mr. PUSEY, on the one hand, as the champion of practical cultivators, and Baron LIEBIG on the other, as the representative of theoretical men of science. As is usually the case, both parties place themselves a little in the wrong; but as is not always the case, the dispute is instructive and useful to the spectators. Setting aside the mere question of profit and loss, we must say a few words on the subject, treating it as a broad question of vegetable physiology, and the nourishment of plants, for the purpose of placing before our readers what we believe to be the true state of the case.

It appears, then, that the English country gentlemen complain that they have been misled and deceived by the crude chemical speculations of the celebrated German chemist; that they have been taught visionary theories in the place of sound facts, and that, trusting to the weight of a great name, and a high scientific reputation, they have been led astray, even further from the real truth than they previously were, when he first undertook to instruct and enlighten them. It is stated that "the mineral theory of LIEBIG has broken down, and no other has taken its place;" and following out this observation, Mr. PUSEY goes on to say "it is a great mistake to suppose that men can be made farmers by teaching them doubtful chemistry;" and, in conclusion, he remarks, "I should not have said so much, but that the public are sometimes led, by a false estimate of chemistry, to undervalue our real progress in other sciences." At the same time, however, whilst thus condemning the views of LIEBIG, and very properly objecting to the teaching of false science, Mr. PUSEY does not wish to condemn chemistry altogether, but is desirous of drawing a marked distinction between crude speculations or scientific errors, and sound practical facts and well established knowledge.

When LIEBIG'S "Chemistry of Agriculture" was published, a dozen years since, it naturally excited a great deal of interest; the reputation of the author commanded attention and respect, and the decided and plausible manner in which his book was written, soon gained for it plenty of believers and admirers. The agricultural world was divided into two classes, those who obstinately refused to listen at all to such new-fangled doctrines, and, on the other hand, those who, blindly adopting as true all the views put forth, even without attempting to weigh the evidence by which they were supported, received every theory of the great German chemist as an established fact, and believed in the most extravagant results as likely to spring from the application of chemistry to farming. There were some few, too, who neither ridiculed the idea of applying science to practice, nor yet blindly adopted whatever was asserted, but, suspending their judgment for a while, set seriously to work to investigate for themselves; but certainly the loudest voices raised were those of the country gentlemen and rich landlords, who, without much knowledge of science, and certainly without attempting to ascertain the truth of the views put before them, eagerly seized on LIEBIG'S theories as the true key to farming, and lauded his book as the dawn of a new reformation. If the landlords have been misled, it is hardly fair to blame the unfortunate chemist alone, for the fact is, that having let their wishes and hopes far outrun the facts, or their own convictions, they have necessarily fallen into a wrong path, and now, having found out their error, they seek to put all the blame on the man who tried to help them, forgetting altogether how much was caused by their own want of consideration and caution.

It has all along been a matter of regret, that the new chemical theory of agriculture was so very warmly taken up, and so highly praised by some of its supporters; and we must take some credit to ourselves for having from the first objected to such blind hero-worship. At the same time practical men are so slow to receive what is new, and so little inclined to receive favourably a more theoretical probability, that had not LIEBIG'S views been put forth with the utmost decision, and in the most positive manner, they would probably never have excited one-tenth part as much attention as they really did; and, therefore, even though his conclusions were ultimately found to be wholly incorrect, he would nevertheless have done good service, by the impetus which they could not fail to give to farming, and by the effects which must necessarily result from the desire for knowledge which they would produce in practical men.

The fault, then, of LIEBIG in the first instance was, that when he ought to have said, "I think it is probable," he said, "it is an undoubted fact;" and the error of the landlords was, that forgetting for once their usual caution and fear of being misled, they blindly adopted all he taught them, and, not even satisfied with that, imagined a great deal more. That LIEBIG, though in error, was perfectly honest and sincere, is proved by the fact, that he even went so far as to connect himself with a trading speculation, endeavouring to make money by a patent manure, and thus risked his scientific reputation on the pecuniary success of a doubtful, though plausible scheme. As the mere fact of his taking out a patent for the manufacture of artificial manure naturally lowered him in the estimation of many, seeming to convert the high and independent lover of science into the petty money-seeking trader, so the subsequent failure of the patent manure still further tended to bring his views and opinions into discredit.

Mr. PUSEY'S remark, that very little practical service has yet been rendered to agriculture by chemistry, and the manner in which he mentions the failure of LIEBIG'S mineral theory, produced a somewhat angry and hasty reply, published in the second edition of "LIEBIG'S Letters on Chemistry" (p. 479). He begins, by stating, that Mr. PUSEY'S remarks are quite incorrect, which, however, is not to be wondered at, because he is not a chemist "by profession," a fact which he endeavours to *prove*, by observing that on two occasions Mr. PUSEY has made chemical mistakes in his writings. No one imagines that Mr. PUSEY is a chemist, but if a writer is to be condemned because he has made two mistakes, we fear Baron LIEBIG must surrender his own chemical reputation; for it would be easy to show that he too has occasionally made mistakes, perhaps even more serious than those of Mr. PUSEY.

In answer to the complaint of the landlord, the chemist replies:—"We have in the last ten years given you the most complete explanations of the nutrition of plants, and the sources of their food; we have shown you that plants must obtain from the soil, as well as from the atmosphere, certain elements; we have explained the nature of the soil, the effects of liming, rotation of crops, and fallowing; we have given agriculture a scientific basis, which it did not before possess. Besides all this, chemistry has taught the farmer the importance of phosphoric acid, about which nothing was known ten years ago (!); the true source of nitrogen, the value of ammonia, and the modes of fixing it; these and many other practical facts have been discovered during the last ten years."

All this sounds very well; and if only half of it were true, it would certainly make out a strong case for the chemists; but we fear the picture is much too highly coloured, and that the facts themselves do not warrant such a boast. The scientific basis of agriculture is still but a very crude and imperfect theory; and so far from the

nutrition of plants being now thoroughly explained, there is hardly any one part of the subject which is not still, to a great extent, enveloped in doubt and uncertainty. The assertion that the value of phosphoric acid has only been discovered by chemists during the last 10 years, is also one we cannot for a moment admit; indeed Liebig himself, in his "Chemistry of Agriculture," refers to Saussure, to show that the importance of phosphoric acid to plants had long been known; and quotes from his work, published nearly 50 years ago, the remark, "we have no right to suppose that plants could exist without phosphate of lime." Or to cite a more recent authority, we may refer to Sprengel, who says, in 1832, "there is not a single known plant which contains no phosphorus;" and again, speaking of the application of bone as manure, he observes "that the phosphate of lime of bones constitutes their chief value as manure, is proved by the well known fact that burnt bones, which contain no organic matter, act very powerfully on vegetation." He also points out the value of mineral phosphates of lime, such as fossil bones, apatite, &c., and states that all marls which contain phosphate of lime are excellent manures. It would in fact be easy to show, that so far from it being true, that 10 years ago "nothing was known in agriculture of phosphorus, or phosphate of lime" or that "no one knew what it was in the bones which really acted," it has been long known and fully recognised that phosphate of lime or phosphoric acid is essential to the healthy growth of plants; this, therefore, cannot be claimed as a new discovery.

The benefits which it is stated agriculture has derived from the progress of chemical science, during the last 10 years, are so vague and of so general a nature that it is hardly worth while to discuss them point by point very minutely. As regards the food of plants, very little more has been done than to confirm the experiments of older observers; and as for the explanations respecting rotation and fallowing, we are quite at a loss to discover which part is new—it seems that pretty nearly all of this part of the scientific system of agriculture was already known and acknowledged; all that portion which is really new is also, at the same, theoretical and unconfirmed; and we must confess that Mr. Pusey's remark is not in any way really met or disproved by the reply of Baron Liebig. At the same time, having the greatest possible respect for the labours of chemists, we must say that we still look forward to them for much real assistance in all departments of the arts of cultivation, and that even if no very important practical application of chemical science have been made during the last ten years, that is no reason to despair of the most valuable results hereafter. Such experiments as those of Mr. Way on the absorptive power of soils cannot fail in time to lead to improvements in practice, though they may take years to carry out and apply. Mr. Pusey observes very truly, that larger experiments, not conducted merely in the laboratory of a chemist, but carried out in a large scale in the farm itself, and devised and executed by a scientific man, are by far the most valuable contributions which can be made to our knowledge of the phenomena of vegetation; and he quotes the excellent experiments of Mr. Lawes in illustration. As may be supposed these experiments do not meet with the approbation of Liebig, and in his reply to Mr. Pusey, he characterises them as being "entirely devoid of value as the foundation for general conclusions." In the last part of the Journal of the Royal Agricultural Society, Mr. Lawes has published the details of his experiments, and every one is, therefore, able to judge for himself of their accuracy, and the conclusions which he draws from them. We shall reserve a few observations on those experiments for another week.

---

Among the matters of horticultural interest in the Great Exhibition, there is a very humble one in a corner of the hardware department, in Class 22, No. 408, which, though late, and only just remarked, deserves to be placed on record. We allude to a model of a heating apparatus, from Mr. Michael M'Sherry, of 3, James-street, Limerick, intended for greenhouses, and similar buildings. The model looks so much like a cubical iron box, that it may be well missed by any one who does not take pains to find it.

The plan of this apparatus is described by the exhibitor in the following manner:—

"To be made of boiler plate iron, with a metal front, for heating by circulation of air. The flame and smoke from the furnace pass under the stove to the extreme end, and then rise at the two sides, return to the front, and get over the top to the chimney, where they do not escape until they pass all round the stove and heat every part of it. The air of the house to be heated is drawn in brick flues under the floor to the under compartments of the stove, passes in them to the extreme ends, then rises to the upper divisions, and finally flows back into the house over a water tank. In addition to this, there is a hot-air box on each side of the fire, through which external air is circulated, as well as through hollow fire bars, discharging the great body of heat (which they usually absorb), into the house, and rendering it available for bottom heat. The stove is to be set in brickwork, and as the outside of it is as hot as any part, much additional heat will be obtained by leaving a space of 2 inches between the stove and brickwork, they bringing external air to act on the two sides, and pass into the house."

We understand that several of these apparatus have been erected with great success, near Limerick, without the hollow fire bars, hot air boxes, or outside casing, which have been late additions. The size of those in use (for houses, 50 to 66 feet), is 5 feet long, 3 feet wide, and 18 inches high; for larger houses it is proposed to make them 6 feet long. Our hothouse heaters will do well to study Mr. M'Sherry's model.

---

## VINE MILDEW.—No. I.

The following Observations on the Vine Mildew, by J. H. Léveillé, D.M.,* translated from the French, with remarks by the Rev. M. J. Berkeley, M.A., F.L.S., were published in the last Number of the "Journal of the Horticultural Society:"

The gardeners in the neighbourhood of Paris have, unhappily, too much reason for remembering the damage done to their Grapes last year by the Oidium Tuckeri. Under these painful impressions they are at this very time watching their trellises every instant, and turning up the leaves in search of the baneful mould. Some return from their observations satisfied with the result, but others alarmed, because they have discovered certain spots on the lower surface of the leaves, which they believe to be clearly due to its presence.

It is, I think, useful to destroy this false notion, which is so generally diffused, and which is causing so much anxiety. What is at this moment taken for Oidium Tuckeri, the mould which destroys the Grapes, is merely the Erineum of the Vine, which has always existed, and which has never attracted much attention, because it is not, in point of fact, injurious.

To avoid this mistake it will suffice to call to mind that the Vine Erineum is constantly produced on the lower surface of the leaves, where it forms spots varying in number and extent. It forms a lining to the depressions, which are the counterpart of the blisters which render the upper surface unequal and tuberculated. As soon as it begins to be developed the surface purses up and exhibits a manifest change of colour. It is at first white, rose-coloured, or pale violet; then it assumes a tawny or rusty tint; even with the naked eye it is clearly due to an anomalous development of the hairs, which assume the appearance of threads. To understand their nature perfectly it is necessary to have recourse to the microscope, under which they appear to be elongated, hollow, cylindrical tubes, without any partitions through their whole length, and absolutely empty. The membrane of which they are composed is simple, uniform, without reticulations, and of the same nature with the epidermis, of which it is a continuation. This fact is beyond all doubt, only the true cuticle forms no part of them, because it has been destroyed or perforated by the development of the subjacent cells. This at least seems to be indicated by a little circular line, or a slight irregularity which exists at the base of each of the threads of which the Erineum is composed.

The causes of this anomalous growth of the hairs are entirely unknown. It is regarded generally as the result of the puncture of extremely small insects. This explanation, however, notwithstanding the authority of Professor Fée, has never appeared to me completely satisfactory. Every one knows that when an insect deposits one or more eggs under the epidermis, or in the substance of vegetable tissues, a great activity arises in the vegetation, and an unnatural development of the tissues; when, on the contrary, they are deposited on the surface of the leaves, their tissue is not affected, and they experience no change. When an insect, then, has introduced an egg under the epidermis, we ought to find the egg itself, the cavity in which it is contained, and the modification of the tissues which it has caused. But neither eggs nor cavities are ever observed, and the epidermis alone is modified. It is very true that we find amongst the threads of old patches of Erineum larvæ and their remains, as also mites and plant-lice. But if we examine the upper surface of the leaf, we find no aperture pierced by the insect, in order to escape and live in a state of liberty; the filaments do not present the least solution of continuity in their whole length; their base always rests on the tissue of the leaves, their free extremity is always obtuse and imperforate, and their cavity does not inclose any traces of old skins or excremential substances. Nothing then justifies the notion that Erinea are like galls, bedeguars, &c., the cradles of insects. If, indeed, we meet by chance with insects or larvæ, the species are not so constantly the same as to justify us in referring to them these accidental forms of vegetation. These observations do not rest merely on the Vine Erineum, but have been repeated on those of the Maple, the Sycamore, the Lime, and the Birch. Whether it resemble a tube or a flask, the accidental production differs simply in form; the organisation and mode of development are the same.

Though the Vine Erineum cannot then be attributed to the puncture of an insect with the view of depositing its eggs, may we conclude that it is due to the puncture of the same insect made in the leaves for the purpose of deriving nourishment from them? Certainly not. Every one knows that, amongst insects, it is the Hemipteræ which have the slenderest mouths. But whether they live on animals or vegetables, they do not derange or tear the tissues in the act of suction by means of the different parts of which their mouth is composed; they employ the most delicate acupuncture which it is possible to conceive; and as soon as the proboscis is introduced, the juices ascend simply in obedience to the laws of capillary attraction. May we suppose, however, that at the same time they introduce some irritating fluid? Nothing authorises this supposition; and besides, were it the case, what would be the condition of the foliage of our trees? Not a leaf would preserve its integrity; all would be diseased. Much more must accidental productions bear some proportion to the size of the insects; but this is not the case; and by a kind of eccentricity which is not rare in the human mind, we refer to the most minute causes, the most manifest effects; a locust may pass over without leaving any traces, where those which a plant-louse causes are indelible.

I repeat, then, that the Vine Erineum does not depend on the puncture of an insect, but is an elongation of the epidermal cells, due to some unknown cause, which exists in the plant itself, as is also proved by the fact that the leaves while still rolled up and plaited exhibit traces of the affection.

I have said enough to enable any one to recognise the Erineum, but to prevent its being confounded with Oidium Tuckeri, I think it right to call to mind the description which I gave of that mould last year, before the Société Philomathique (1850, August 3).

The plants on which the mould is developed present the same appearances as others, except that the shoots of the year, the leaves, bunches, berries, and stamens, in a word all the diseased parts, are covered with a very thin white pulverulent down, which is visible at some distance, and which diffuses a very perceptible mouldy smell. It forms on the leaves white circumscribed spots, which resemble those of Erysiphe. This down, when examined under the microscope, is formed of slender branched articulated threads, which creep over the surface of the leaves. From different points of this primitive mycelium spring little erect straight stems, which are transparent, simple, and articulated, and which bear at their extremity three, four, or five oval or elliptic simple hyaline spores, joined end to end like the beads of a necklace, and filled with extremely fine granules. These granules, when forced out by compression between two plates of glass, are spherical, transparent, and endowed with molecular motion.

These characters do not leave room for any confusion. One of these productions is confined to the under surface of the Vine-leaves; it is persistent, and does not disappear when rubbed; the other, on the contrary, attacks every part of the Vine except the old branches and roots; it is only temporary, and disappears on the slightest friction.

In questions of the diseases of the Vine, however, the Erineum seems to bear a certain part. At least this was the case in 1835, when M. Duby communicated to the Natural History Society of Geneva his observations on Torula dissiliens, which occasioned the premature fall of the leaves of the Vines in a great part of the valley of the Leman Lake. M. Vallot, of Dijon, thought that he recognised in this plant the Erineum vitis. MM. Alphonse De Candolle and Duby opposed this view, because they were well acquainted with the Erineum, and had made a particular study of Torula dissiliens. M. Vallot is, to a certain extent, excusable, because he had seen neither the new Torula nor the figure which accompanies the memoir of M. Duby. But the persistence of the Erineum, and the ease with which the Torula disappears, ought to have raised doubts in his mind. It is sufficient to blow strongly on the lower surface of the leaves to cause it to fly away. So much is this the case that M. Alph. De Candolle remarks, in a note, "When I wished lately to re-examine the Torula dissiliens preserved in my herbarium, I found that the act of drying had caused almost all the joints of this microscopic plant to fall. There remains only the diseased leaves of the Vine, marked with traces of the parasite, and some very fine powder."

The Oidium Tuckeri is more easily preserved, and is not dispersed by a mere breath of air; but it is, nevertheless, difficult to recognise its character in dried specimens, because the spores separate with the greatest ease when it is dry, and nothing but the mycelium is left behind, which resembles that of an Erysiphe.

The certainty which has been acquired of the spontaneous development of moulds on some living animals, and especially that of Botrytis Bassiana, on silkworms, has made people believe, though wrongly, that many diseases of vegetables and animals were due to a similar cause. Exaggeration has been pushed a little too far. It is well known now, from the researches of M. Decaisne, that the nematoid mycelium, which we find under the epidermis of diseased Potatoes, Pears, and rotten Apples, &c., is consequent on disease in those productions. It is the same with the Oidium of the Grape. Mr. Berkeley in England, and M. Duchartre in France,

* Recherches sur la Maladie des Vignes, par J. H. Léveillé, D.M. Extrait de la Revue Horticole, No. du 18 Juin, 1851.

think that the mould is the first cause, and the disease its consequence. The researches which I have made do not allow me to participate in the opinion of my honourable friends. M. Decaisne and myself have made vain efforts to discover under the epidermis the least trace of mycelium upon the Grapes, the Vine leaves, and on the branches, when beginning to be diseased. We have satisfied ourselves that all the phases of the vegetation of the Oidium take place on the surface. The tissues are affected first, and when a white spot begins to appear, however minute it may be, the mould is developed; if the finger is simply passed over it, it disappears; and if we examine the spot with a lens, we see at the point which it occupied, and around it, where no malady was suspected, extremely minute black or brown specks upon which the mould is successively developed. The parenchym, which corresponds with these specks, is equally brown and less filled with juice than that which surrounds it; if at this time it were covered with or traversed by mycelium, one ought to find it; but this is not the case. At a later period the epidermis is frayed, the parenchym dries up, and, after having lived some time, the fungus disappears.

When the stalk is diseased through its whole extent, the Grapes entirely perish; when the malady attacks the berries in the first stage of development, they dry up or fall; if, on the contrary, they have acquired a certain size, they are able to resist it; some crack, split, and expose their seeds; others are deformed and arrive at maturity, but they never acquire the size which they would have done had they not been diseased. Like fruits which have been punctured by insects, they appear to me to ripen before other Grapes: but they are rather fleshy than succulent, and they are almost destitute of flavour.

Another question which preoccupies many minds is that of contagion. I avow beforehand that I have no belief in it. According to my views the fungus does not propagate the malady, but the primitive derangement of the tissues of which I have spoken is endemic. It is the same with the Potato disease. It is impossible for us, notwithstanding the numerous researches to which that malady has given rise, to say to what cause it is due. To prove the existence of contagion we ought to be able to produce at our pleasure the disease of the tissues; but we cannot do so. People, to prove contagion, say that they have placed a sound Grape by the side of one which was diseased, and that on the morrow or the day after the two Grapes were equally bad. This experiment, which I have repeated myself many times, and which has always succeeded, may be interpreted in two ways; first, we may have placed by the side of a diseased Grape another in which disease had already commenced, or which was predisposed to contract it; and secondly, the ease with which moulds are developed causes their spores when dispersed to germinate and fructify on almost all kinds of bodies, provided their evolution be favoured by moisture and temperature. In this case the remarkable circumstance is, that the points of the fruit or leaves on which the moulds are developed do not present the brown spots. Those who last year attentively followed the progress of the Vine disease, have remarked that it had an exacerbation which lasted till the 15th of August. This relapse, though real, had no destructive consequence; it was the result of the torrents of rain which fell on the 6th of August; its violence had cleansed the Grapes and leaves, but in the following days the spores which had been disseminated germinated again. As the disease was over before, the Oidium ran through its phases of vegetation, and the Grapes did not cease to grow. Before the storm of which I speak I had already acquired a certainty of the fact that when the leaves were frequently syringed with common water the fungus grew abundantly, and the Grapes were not the more diseased. It is to this protracted mode of propagation that we must attribute the small influence of the malady on a great number of the berries which, though almost entirely covered, arrive notwithstanding at perfect maturity.

These spontaneous recoveries deserve more attention than may appear at first sight; they may take place when some particular remedy is applied; and since it seems to have succeeded, all the advantage is attributed to the remedy. I have never seen these recoveries at the beginning of the disease, that is to say, when the berries were forming; but when they have acquired a certain size the Oidium is then contagious, and may appear two or three times on the same Grape without its being sensibly inconvenienced, because it is superficial, and there has been no primitive disease of the tissues. I am, however, exaggerating a little; its harmlessness is not always so great; when it covers the Grapes with a thick mycelium it stifles the berries; but then they do not crack, they dry up.

## BRITISH SONG BIRDS.

(Cage Birds, No. 32.)

No. XLVIII.—We have now entered on the gratefully-pleasant month of October; and are fast hastening onwards to the last splendour of an autumn, the loveliest ever known. The trees, partly stripped of their graceful foliage, are bowing reverentially before the gales of the equinox, and revealing those hidden beauties which summer had so carefully concealed from sight. We now view their symmetrical proportions with greater facility, and are, or should be, lost in admiration at the minute tracery of their branches. Wander where we may, among the trees—or in the woods,—all is inspiriting, all is delightful.

That fair goddess of light, the moon, is now nine days old; and the evenings are bright enough to call us forth for an admiring stroll. Of all months in the year, commend us to October for this healthy exercise. When the "leaf fades," then is the time

> "To contemplate and worship Him, whose mind
> Stirs in the stilly night-like solitude;
> Or breathes in whispers on the gentle wind
> Through vast cathedral groves,—and leaves a calm behind:"

And viewed by moonlight, we revel in the rich, glowing, and splendid *ensemble* produced by the stately Oak, majestic Chestnut, the smooth Beech, with its lofty head, and the silver-stemmed Birch,—all revealing their natural florid hues of brown, yellow, red, and orange. These, contrasted with the verdure of the trees yet unclothed, afford the lover of nature a treat inexpressible. But we must not let our reflections carry us away from the main subject.

The "birds of passage" being now, all of them, about to take their final and immediate leave of us, till next spring, we shall necessarily have to seek "compensation" for their loss in the best way we can. The woodlark, goldfinch, linnet, robin, and others of our popular favourite song birds are now in full feather—and, what is still better, they are in full song. Such, therefore, of our friends as feel anxious for a fire-side companion, during the approaching winter, should not lose one moment in providing themselves. In every case, let me remind my reader, he should *hear* the bird he selects *sing* before he becomes a purchaser. This prevents any disappointment hereafter, and dissipates all doubt as to the excellence of the performer. It is also more satisfactory to the dealer, for (if *honest*) he is aware that should you be well satisfied with your first purchase, you will come again. Full many, however, I fear, neglecting this precaution, buy *once*,—but never a second time return to the same shop; unless, indeed, it be to complain of their having been "done!"

Now for a word or two on the subject of bird-cages. No opportunity could present itself, more fitting than the present (whilst we are introducing miscellaneous topics) to offer a few remarks on the miserable accommodation provided in this country for the comfort of the little prisoners whom we domesticate in our respective families. In no one respect do we come more behind our neighbours than in this. How is it? Can no ingenuity devise a handsome and *appropriate* dwelling for so interesting and affectionate a little creature,—one which forms so needful an appendage to our "Household Gods?" It is indeed time we awakened to a sense of shame in this matter, for our English bird-cages are a national disgrace. While the "Great Exhibition"* yet remains open—a short week, let us urge some clever workman (if he has not yet done so), to pay it an immediate visit, and admire Austrian skill, as evinced in the department of the Zollverein. There, on a stand in the nave, are exhibited a vast number of elegant, commodious bird-cages, of the most fanciful character, at once a comfort to the inmate, and an object of admiration to the eye. The tin—they are all of tin—is perforated by fitting machinery, and represents filagree work; and no other substance whatever is used in the construction of the cages. Hence, no blood-thirsty vermin can intrude; the article is imperishable, and its tenant rendered "happy for life." The configurations of these cages are beyond all praise; and if our artist-workmen only catch the idea, and work it out, then will the "Exhibition" be held in everlasting honour by all lovers of birds.† Our province does not go beyond *this* limit; else could we be eloquent in elaborating the praise of our "National Workshop." It has furnished ideas, of which, should proper advantage be taken, there is no saying *where* our ingenuity may stop. It brings us nearer than we have ever yet been, to "the Perpetual Motion;" and we *do* hope that, so far as our *protegés*, the birds, are concerned, *they*, at least, will hereafter be partakers of the immensity of benefits accruing therefrom. *William Kidd.*

* As the "Great Exhibition" will be for ever closed to the sight-seeing public in a few brief days, we shall offer no excuse for speaking at the eleventh hour of what is yet to be seen within its walls. We allude to the domestication of four splendid robins (in the spacious refreshment-room of Masters and Co.), whose powers of song joyously put forth in their extensive flight from end to end of the apartment, can hardly be imagined, unless heard. All who doubt what we have so long asserted about the great natural *affection*, the extreme loveliness, and the musical execution of this bird, may now prove our veracity, and for ever satisfy their own doubts. The birds in question have free ingress and egress: but so truly do they love the society of man (and woman, of course), that they are *the last* to quit the building after the bell has rung. The best mode of access to this room is through the eastern entrance of the building. It will be found immediately under the American Gallery, or more properly speaking, under the Gallery of Stained Glass. We, of course, are often "found" here; nor do we consider, though we are no bad hands at "refreshment," that we ever pay "too dear for our *whistle!*"

† It is, perhaps, desirable that I should mention the fact of all these cages having long since been disposed of. No more of them, I am told, can be obtained in this country at any price; but as the "principle" is not patented, the field is open to a skilful artisan, and the speculation would surely be a "safe" one.

## Home Correspondence.

*How to Crop a small Kitchen-garden.*—Believing it to be the wish, as it certainly is the duty, of every gardener to get as great an amount of produce off the garden under his care as possible, I shall endeavour, from time to time, to explain how this is to be effected. The system of cropping which I shall inculcate is founded on that pursued by the market-gardeners round London; slightly altered, of course, so as to suit the requirements of a private establishment. Having been both a gentleman's and a market-gardener for years, I shall recommend nothing but what I have myself experienced to b best. My plan simply consists in having arrangements made for one crop to leave room for another, by which process there is no occasion for the land ever to lay idle (except for a month or two during winter), but often to have two crops on it at one time. In this way as much may be derived from 1 acre as is usually obtained from 1¼ acre, and that without much extra labour or cost. Many will, doubtless, object to my system of rotation, as being contrary to rules laid down in books; but I would have such to understand that the market-gardener observes no such rules, and where is the private one who succeeds better than he does? As during the coming week market-gardeners will be busy getting in their Early Horn Carrots and Lettuces, it may not be out of place if I give in detail here the cheapest and, at the same time, the best plan of growing these vegetables, so as to have them early. I believe that, in some localities, Horn Carrots are sown in the open ground in autumn with the best results. In most places, however, they would be found an uncertain crop; but by growing them in the following manner success is certain. Let some light, rich soil be obtained (that of the garden will do, provided it is light); choose a spot lying well to the winter's sun; mark out a space 8 inches wider than the frame on all sides, lay down 4 inches of stable litter, and on that 4 inches of soil, put on the frame, and fill to within 4 inches with soil, rake level, and sow the Carrots, rather thickly, so as to insure a crop, as it is easier to thin out than put in. Do not sow the Lettuces too thickly, as no great quantity of one sowing is ever required in a private garden; what should be aimed at is a regular succession; let the sort be the White Paris Cos; sift a little soil over the bed, just sufficient to cover the seed, put on the lights, and shut close till the Lettuces make their appearance, then draw off the lights every dry day; if wet, let them remain on, but raise them 6 inches at the back. If frosty, keep close, except while the sun shines on the frame, when air should be given; they require no covering, except the lights, as the chief thing to guard against is damp. Keep thoroughly dry, and success is certain. Thin the Carrots at first to 1 inch apart, the Lettuces to 4 or 5 inches; in March plant out the Lettuce, and take away the frame, if it is required for any other purpose; bank up a little earth round the bed, to keep the rain from washing down the edges; then thin the Carrots to about 3 inches apart. *J. Steel, Clitheroe.*

*Habits of Rooks.*—A friend of mine has a park, in which are several acres of sylvan pasture, the trees being nearly as close to each other as if in a wood. It is protected from the prevailing west wind; in fact, it is a steep bank facing the east. There are no nests, but myriads of rooks come every night to roost from all the rookeries in the neighbourhood. Is this an usual circumstance? Is it the protection from wind or what? The bank is partly gravelly, partly boggy, and full of natural springs. *Gallicus, Mold, Sept.* 30.

*Fuchsia Princeps.*—Allow me to correct a typographical error which has crept into my communication of last Saturday. The fine and striking variety of Fuchsia which I noticed in the nursery of Messrs. Lucombe and Pince, is not named Princess, as printed at p. 614, but Princeps. *A Devonian.*

*Meat Biscuit.*—Among the remarkable novelties of the Exhibition, there are, in the American department, meat biscuits (No. 524), invented by Mr. Borden, of Galveston, Texas, but no notice has yet been taken of them in the public papers. It is known that the preservation of meat has not been practicable except in canisters; and that portable soup has been a mere preparation of gluten. Mr. Borden has attempted, and succeeded, in making a portable soup of meat, and the invention will be one of vast importance to Australia, where bullocks are killed for their fat, skin, and bones, and where the meat is wasted. Mr. Borden boiled down the meat of bullocks to a sort of essence, which was then strained. Enough Wheat flour was added to give it a firm consistence as paste, and it was then cut out and baked as biscuits. From the appearance of these biscuits it would be hard to detect them from fine captain or sea biscuits. Four ounces of biscuit make from a pint to a quart of excellent soup; having, from the meat, the nitrogenous qualities which gluten is deficient in, and having the nutritive vegetable matter of flour. The value of the discovery to exploring parties—to persons going a long inland adventure—to military on a rapid march, at a distance from naval supplies—is exceedingly great. Added to this, it affords to Australia the means of obtaining a new and important article of export. *X. X.* [This is one of the most important articles in the Exhibition. You will do well to consult hereafter the report of Jury No. III., upon Mr. Borden's preparation.]

*The Ribston Pippin Apple.*—It may be interesting to know, that the original tree has this season produced, for the first time since 1835, a few Apples, of the true variety. At present the tree is in a fine healthy condition, measuring about 10 feet in height, and 32 feet in circumference. *G. M., Ribston Hall, Wetherby, Yorkshire, Sept.* 30.

*Potato Disease.*—It is stated at p. 611 that you have found the "Chinese" Potato very much diseased. My experience is, however, very different. I have planted this variety in a strong loam, well dug and manured, for four successive years, and I have never had a single diseased Potato. I have just taken up the produce of this season. It is small, but excellent in quality, and not one of the tubers is diseased. The Russian is equally free from blight, and the produce is greater. *J. Gould,*

*Amberd.*——I have just taken up Potatoes from which I pulled the tops in the second week in August. I had not a score of diseased tubers out of the whole lot, but they were rather small. I have pitted them in the same way I have done before, and kept my sound Potatoes good till spring; that is, by laying alternate layers of Potatoes and mould, bringing the heap to a point, with about 7 or 8 inches of mould on the sides. For an experiment, I left a few with the tops on, the half of which were very badly diseased, but they were much larger than those from which I pulled the tops. *W. Griffin, Eydon, Daventry.*——In the year 1844 I purchased of Messrs. Warner three excellent kinds of Potatoes — the Shepherds, Martins, and Ash-leaved. Finding the two first better in flavour, more productive, and nearly as early as the last, I cultivated them with care; not one has been affected with the disease. This year I again planted a few Ash-leaved, and have had several diseased. When I first had the Martins, they were yellowish and waxy, now they are nearly as white as the Shepherds, which are remarkably so, and so farinaceous, that they require to be boiled with great care. The Martins are larger and more productive than the other. As all rapidly-growing plants, they require well-manured soil; that is, a full and well-prepared supply of "food." Of the rare kinds, the small should be preserved for seed. Five years since, from small Potatoes of these kinds, planted late and very thick, in good ground, I obtained a heavy crop. Of the field Potatoes, the best cultivated here is called "Red Scotch," which is remarkable for its good keeping; a good plan is, on digging them, to reserve apart for seed all those which have a good form and a good colour—colour being a good test of the quality of the Potato. Those ill-shaped are as good for the table, and the small I reserve for the domestic animals. It is injurious to disturb, as many do, the Potatoes stored for planting. *Agricola Cæsariensis.*

*Paulownia imperialis.* — I have found this to be perfectly hardy. A plant raised from a slip six inches long, planted three years since, is now 18 feet high, and the stem is 20 inches in girth near the ground. *J. Gould, Amberd.*

*Pruning Forest Trees.*—The advocates for the practice of pruning forest trees are probably not "convinced" of the error of their doctrine, and are only "silenced" because the controversy can be decided by experience and observation alone, and not by argument. Your correspondent "Quercus" (p. 596), seems to think he has proved his point that pruning is injurious, by the statement (which no one denies), that when a close-cut wound is healed over with new formed wood, there is never any real union over the section: true — but I assert that, for most purposes, it is of no consequence whatever, that there should exist a flat circular space of a few inches in diameter, and of no appropriate thickness, disunited from the layers of sound wood that grow over it. Besides, what is the alternative? either the branch continues to live, and forms a continually enlarging knot, which impairs the value of the timber in proportion to its size; or the branch dies, drops off, and heals over, when you have the same defective union (as in the case of a pruned branch), and you have in addition the remains of the stump of the branch, forming a mass of rottenness of greater or less extent; or the branch rots away, and does not heal over, but allows water to lodge, when the rottenness gradually eats into the heart of the tree and destroys the timber. Every one must allow that there are certain cases in which pruning becomes absolutely necessary, as, for instance, when trees overhang a road; in such cases it is well that the owner should know that the close cutting method may be practised with safety, while the snag method leads to the slow but almost certain destruction of the tree. Of this fact I am so convinced that I am surprised that any one who uses his eyes in the matter can be found to deny it. *Expertus.*

*Conifers at Bayfordbury.*—Having been solicited by several individuals to give the size and growth of certain species of Conifers at this place, particularly those from Mexico, which have been considered tender, but which have stood well here, without the slightest protection, since the first winter they were planted out, I beg to send you a statement of some of the largest trees now growing in our Pinetum, and also of others of the same kind planted as single specimens in the park, and which are now forming fine objects. The latter are fenced round, some with square, and others with triangular guards, with a view to protect them from cattle, &c. The square guards are preferable, as they can be made with one-side hinges, so as to admit of a person getting inside when required; they are cheap, consisting only of four posts and a few rails, &c. They should be made 6 feet high, and 4 feet square, with a space of about 2 or 3 inches between each rail, in order to admit light and air to the plant. There are few lawns sufficiently extensive to accommodate the larger varieties of Conifers, without their being crowded, which spoils their appearance; and as Conifers may now be obtained cheap, both in the London and country nurseries, I would strongly recommend persons wishing to improve the scenery of their parks or pleasure grounds, to plant those mentioned in the following list; some succeed best in a light sandy soil, yet there are many that like a strong loam, or even clayey ground, and some thrive well in moist situations. For instance, the Douglas Fir and Abies Menziesii will grow luxuriantly in damp places, and may be planted within 10 or 12 feet from the side of a lake or pond, while others, such as Abies Morinda, Picea Webbiana, P. amabilis, and P. nobilis, together with Taxodium sempervirens and Cryptomeria japonica, delight in moist places, but not in low situations, as they are likely to be injured by the spring and autumn frosts. For the Pinus tribe, sandy or loamy ground is most suitable, and the varieties best adapted for the park would be the larger growing ones, and the most distinct kinds, such as Pinus ponderosa, P. insignis, P. macrocarpa, P. Laricio, P. Sabiniana, P. Montezumæ, Deodar and Cedar of Lebanon, Pinus Massoniana, P. maritima, and P. hispanica. The last three would answer in high and exposed situations. If clumps are wanted instead of single trees in different parts of a park, &c., I would advise the individual plants to be placed at a good distance from each other; say from 30 to 35 yards apart, and the introduction of the following showy kinds of Thorns would add much to their beauty, such as Crætagus oxyacantha rosea, C. Aronia, C. odoratissima, C. tanacetifolia, C. salicifolia, C. Douglasii, C. nigra, C. oxyacantha aurea, C. variegata, C. Mexicana, C. cordata, C. oxyacantha flore pleno, &c. Many other varieties might be added, together with some of the showy Pyruses, Sorbus, &c., which would tend to form an interesting group when they had attained some size. The following table will convey some idea of the kind of trees I have under my care here.

| Name. | Height when Planted. | Date of Planting. | Present Height, September, 1851. | Spread of Branches. | Circumference of the stem 1 ft. from the Ground. | Native Country. |
|---|---|---|---|---|---|---|
| Pinus apulcensis ... ... | 6 ins. | May 1841 | 18 ft. | 18 ft. 6 ins. | 2 ft. 5 ins. | Mexico, near Apulco. |
| ,, Montezumæ ... ... | 2 ins. | 1841 | 12 ft. 6 ins. | 15 ft. 6 ins. | 2 ft. 7½ ins. | Mexico, Mountains near Ajusca. |
| ,, sp. ... ... | 9 ins. | 1837 | 15 ft. 6 ins. | 19 ft. 3 ins. | 2 ft. 6 ins. | Mexico. |
| ,, Russelliana ... ... | 6 ins. | 1841 | 8 ft. 6 ins. | 13 ft. 6 ins. | ... | Mexico, near Real del Monte. |
| ,, Hartwegii ... ... | 3 ins. | 1841 | 6 ft. 6 ins. | 7 ft. 3 ins. | ... | Mexico, on the Mountain Campanario. |
| ,, macrophylla ... ... | 3 ins. | 1841 | 6 ft. 8 ins. | 8 ft. 4 ins. | ... | Mexico, on the Octillo. |
| ,, Llaveana ... ... | 4 ins. | 1841 | 6 ft. 2 ins. | 8 ft. 6 ins. | ... | Mexico. |
| ,, ayacahuita ... ... | 4 ins. | 1841 | 7 ft. | 6 ft. 2 ins. | ... | Mexico. |
| ,, Teocote ... ... ... | 6 ins. | 1841 | 10 ft. | 9 ft. 10 ins. | ... | Mexico, Real del Monte. |
| ,, patula ... ... ... | 9 ins. | 1845 | 12 ft. | 8 ft. 6 ins. | ... | Mexico, Real del Monte. |
| ,, Laricio ... ... ... | 1 ft. 3 ins. | 1835 | 34 ft. | 19 ft. | 3 ft. 9 ins. | Corsica, Spain, Greece, &c. |
| ,, macrocarpa ... ... | 9 ins. | 1836 | 23 ft. | 21 ft. 6 ins. | 3 ft. 4 ins. | California. |
| ,, Sabiniana ... ... | 1 ft. | 1837 | 18 ft. 2 ins. | 17 ft. 6 ins. | 2 ft. 6 ins. | California. |
| ,, ponderosa ... ... | 1 ft. | 1837 | 25 ft. 6 ins. | 12 ft. | 3 ft. 3 ins. | North-West coast of North America. |
| Abies Menziesii ... ... | 1 ft. | 1836 | 19 ft. 9 ins. | 11 ft. 6 ins. | 1 ft. 11 ins. | North of California. |
| ,, Deodara ... ... ... | 1 ft. 6 ins. | 1836 | 25 ft. 6 ins. | 15 ft. 6 ins. | 3 ft. 2 ins. | Nepal. |
| ,, ,, ... ... ... | 1 ft. | 1837 | 17 ft. 6 ins. | 16 ft. 6 ins. | 2 ft. 9 ins. | Nepal. |
| ,, Douglasii ... ... | 1 ft. 4 ins. | 1838 | 19 ft. 6 ins. | 17 ft. 4 ins. | 2 ft. 3 ins. | North-West coast of North America. |
| Pinus insignis ... ... ... | 9 ins. | 1848 | 18 ft. | 18 ft. 6 ins. | 4 ft. 9 ins. | California, near Monterey. |
| Araucaria imbricata ... | 1 ft. 3 ins. | 1836 | 17 ft. | 10 ft. | ... | The Cordilleras of Chili. |
| Abies cephalonica ... ... | 6 ins. | 1840 | 6 ft. 11 ins. | 6 ft. 2 ins. | ... | Cephalonia, on the Black Mountain. |
| Pinus Brutia ... ... ... | 9 ins. | 1838 | 13 ft. 9 ins. | 16 ft. | ... | Mountains of Calabria. |
| ,, Pythusa ... ... ... | 6 ins. | 1840 | 13 ft. | 11 ft. | | |

—*J. Slowe, Gardener to W. R. Baker, Esq., Bayfordbury, Hertfordshire.*

## Societies.

Caledonian Horticultural, *Sept.* 4. — Professor Fleming in the chair. The chairman, on intimating the death of Dr. Neill, stated that but one opinion prevailed as to the propriety of the course followed by the committee appointed for arranging the details of the general meeting, in abandoning all idea of an anniversary dinner, in consequence of the bereavement experienced. He then stated that, from the origin of the Institution, Dr. Neill had devotedly and successfully discharged the duties of secretary, and by every means in his power contributed to the credit and usefulness of the garden.—On this occasion there was an excellent display of fruit. Grapes, in particular, were very superior; and among flowers, Dahlias and Hollyhocks were fine. The premium for the best two sorts of Peaches was assigned to Mr. Crocket, gr. to Colonel Ferguson, for Bellegarde and Royal George; a second prize was voted to Mr. Ramsay, gr. to Sir D. Baird, Bart., for Noblesse and Royal George; and a third to Mr. R. Melville, gr. to G. Simson, Esq., for Red Magdalen and Noblesse. For the best two sorts of Nectarines, the prize was awarded to Mr. Crocket, for Elruge and Violette Hative; and a second award was made to Mr. Thom, gr. to C. Balfour, Esq., for Newington. For Muscat Grapes, the silver medal, as first prize, was voted to Mr. W. Thomson, gr. to Lord Belhaven, who produced an excellent bunch, weighing 2lbs. 10 oz.; and a second to Mr. Lees, gr. to the Earl of Haddington. For Black Hamburgh, the silver medal, as first prize, was awarded to Mr. Thomson, for a beautiful bunch weighing 3 lbs.; a second prize was voted to Mr. Thom, and a third to Mr. Lees. For Frontignan the prize was obtained by Mr. Crocket. For the highest flavoured bunch, the prize was gained by Mr. Lees, with Chasselas Musqué; and a second award was voted to Mr. Fowler, gr., Smeaton, for the same variety. For the best grown Pine-apple, the prize was awarded to Mr. Smith, gr. to W. L. Paterson, Esq., the variety being Black Jamaica. For Moorpark Apricots, the first prize was awarded to Mr. Ramsay, and the second to Mr. Addison, gr. to the Earl of Wemyss. For Green-gage Plums there were nine competitors, and awards were made respectively to Mr. Mackie, gr., Cally House, and Mr. Thom. For two sorts of Plums (exclusive of Green gage), the prize was awarded to Mr. Mackie, the kinds being Washington and Victoria. For Melons, the first prize was awarded to Mr. Mitchell, gr. to Lady Keith, for Irish Green-fleshed; the second to Mr. Mossman, gr. to J. Hunter, Esq., for Bromham-hall; and the third to Mr. Mackie, for Duke of Bedford. For Jargonelle Pears an award was made to Mr. Addison, Gosford. Dahlias: In the Nurserymen's Class, the highest prize (one guinea) was assigned to Messrs. Dickson and Sons, the kinds being George Glenny, Beeswing, Marchioness of Cornwallis, Duke of Wellington, Mr. Seldon, Crocus, Grenadier, Queen of Lilacs, Sir F. Bathurst, Hon. Mrs. Ashley, Mr. Herbert, Newington Rival, Yellow Standard, Gem of the Grove, Duke of Cambridge, John Edwards, Miss Spears, and Seraph. In the Practical Gardeners' class, the highest premium (one guinea) was assigned to Mr. Oswald, gr., Murthly Castle, Perth, for Crocus, Mr. Seldon, Sir F. Bathurst, Marchioness of Cornwallis, John Edwards, Beeswing, Duke of Wellington, Grenadier, Black Prince, Emperor of Whites, Miss Spears, and Mr. Herbert. The silver medal, as second prize, was awarded to Mr. Addison, for Grenadier, Captain Warner, Fearless, Sir E. Antrobus, Box, Duke of Wellington, Sir F. Bathurst, Mr. Seldon, Queen of Primroses, Purple Standard, Cardinal Ferretti, and King of Dahlias. A third premium was awarded to Mr. Reid, gr. to Sir J. Richardson, Bart. In the Amateurs' Class (*i.e.*, cultivators who manage their own plants) the highest prize was assigned to Mr. W. Cattnach, for Crocus, Grenadier, Duke of Wellington, John Edwards, and Marchioness of Cornwallis; and a second award was made to Mr. Sanderson, for Beeswing, Snowflake, Duke of Wellington, Cleopatra, Shylock, and Beauty of Hants. For Fancy Dahlias the prize was awarded to Mr. Reid, Pitfour, for Empereur de Maroc, Miss Jane, Rainbow, Triomphe de Magdeburg, Forget-me-not, Mrs. S. Lefevre, Pantaloon, Miss Blackmore, Remembrancer, and George Clayton. There were six competitors for Hollyhocks. The first prize was awarded to Mr. Pow, gr., Norton, Ratho, for Napoleon, Sultan, Purpurea perfecta, Queen, Mr. Russell, Robert Burns, Formosa, Rosea grandiflora, Mrs. Berwick, and Lady Clark. A second premium was voted to Mr. Veitch, gr., Melville Castle, whose stand contained blooms of Susannah, Robert Burns, Marchioness of Lothian, Gustavus, William, General Bem, Pyramidalis, Shakespeare, Thunderer, Sabrina, Magnum Bonum, and Clio. A third prize was assigned to Mr. Webster, gr., Ingliston. There was no competition for the prize offered for the four best trained Verbenas; but an award was made to Mr. Crombie, gr. to J. Adam, Esq., who produced four pots of Verbenas, the varieties being Othello, Madame Benzod, Reine Hortense, and Masterpiece. For Vegetables, the first prize was awarded to Mr. Thomson, gr. Woodburn, whose collection embraced more than 70 different sorts; and the second to Mr. J. Pender, gr., Moredun. There were likewise many meritorious extra productions sent for exhibition only (not for competition), and for these honorary awards were made and thanks voted according to circumstances. Messrs. Dicksons and Co. sent a general collection of exotics, embracing fine plants of Lilium lancifolium, punctatum, and speciosum, together with large stands of Dahlias, Pansies, and Clove Carnations. Messrs. P. Lawson and Son contributed stands of autumn-flowering Roses, Dahlias, Hollyhocks, French and African Marigolds. Mr. Carstairs, greenhouse plants; Mr. Handasyde, Dahlias; Mr. R. M. Stark, Asters and Marigolds, with Nemesia tricolor, Veronica, speciosa rosea, &c.; Messrs. Downie and Laird, West Coates, Hollyhocks and Asters; and Messrs. Ballantyne and Sons, Hollyhocks. From the garden of Professor Syme, there were beautifully flowered plants of Erica Macnabiana, eximia, retorta major, and Jacksoni, Roella ciliata and Pleroma elegans; from the garden of S. Hay, Esq., Echinocactus mammillosus in flower, and a fine plant of Primula Stewarti; from the garden of I. Anderson, Esq., a new species of Lilium, raised from seeds received by him, from Colonel Eyre, China; and a new species of Calceolaria, raised from seeds which he had received from Dr. Jameson, of Quito; from R. Girdwood, Esq., seedling Phloxes, and a Musk-scented Mimulus, with large blotched flowers; from J. Adam, Esq., Verbenas and Lobelias in pots; from J. Mood, Esq., Fuchsias (Purity and Sir John Falstaff), a white variety of Campanula pyramidalis, and stands of Dahlias and China Asters; from Mr. Crocket, Cockscombs; from Mr. Laing, gr. to the Earl of Rosslyn, blooms of a white seedling Hollyhock; from J. M. Mitchell, Esq., a fine plant of Agapanthus umbellatus; from G. Ritchie, Esq., China Asters and French Marigolds; from Mr. Veitch, Hollyhocks; from Mr. Grieve, Hollyhocks and Pansies; from Mr. Saddler, Hollyhocks; from Mr. Nicol, Hollyhocks, and an ornamental design of flowers; from J. Finlayson, Esq., a promising seedling Pansy, and stalks of Peruvian Barley; and from Mr. Mackie, and Mr. Gemmell, African and French Marigolds and China Asters. The latter were extremely fine. Twelve new members were elected.

## FLORICULTURE.

Arrangement of Flowers in Stands.—Permit me to offer a few observations on the mode adopted for reporting the names of winning collections of Dahlias, &c. My *début* was only made at page 567 of the present volume, so I shall not require to refer far back for an illustration. Some explanation is however necessary, in order that all may be benefited by the system pursued, for system I hold it to be, and one that must convey important information, displaying, as it does, the relative characters of the several productions, and also giving a tolerably clear idea of the taste employed by the different exhibitors in arranging their flowers. Little difficulty is experienced in placing them according to size, so as to set them off to the greatest advantage; and uniformity, as to distance apart, is also easily preserved; but something more is needed, viz., the producing a happy admixture of colours, and their tints, as viewed from the different angles of the stand, "Oft has it been our lot to mark," the very reverse of an artistic whole, even in the arrangement of a single dozen varieties of this or that flower, say the Dahlia; I have seen Earl of Clarendon side by side with the Iron Duke (Drummond), or Leda near Goliath; Admiral hand in hand with Queen of Lilacs, or his Grace of Cambridge, all alike fearless of consequences. Our hero of free trade has ere now been seen in company with Sir Frederick, and Perfection's Standard. These are but illustrations, given "to avoid," and (if my notions of arrangement be correct) they are "dangerous." I find, however, that I have somewhat run out of the course, so let us return to our starting point. It may occur that I shall have occasion to notice a flower in some particular collection; that flower may be referred to by number, and its position in the stand thus indicated; our custom in reporting the names of winning collections, has been to start from the left hand corner of the back row thus:—

| | | | |
|---|---|---|---|
| 1 | 2 | 3 | 4 |
| 5 | 6 | 7 | 8 |
| 9 | 10 | 11 | 12 |

If the collection be 24, then the back row will number from 1 to 8; the centre row from 9 to 16, and the front row from 17 to 24; if but six flowers are set up, they should stand thus:—

| | | |
|---|---|---|
| 1 | 2 | 3 |
| 4 | 5 | |
| 6 | | |

I may remark that the Metropolitan stands, long since enforced by that late society, are *those* now universally adopted, and I am of opinion that all societies should require flowers to be staged in that manner; if of no other advantage uniformity at least would be secured. Twenty-four Pansies are displayed in four rows of sixes; if 36, then four rows of nines, as are Carnations, Picotees, and Pinks; but for these I adopt the Horticultural Society's regulations, in which were given the size of pot, and the distance from bloom to bloom. In reporting I shall in all cases start from the left-hand corner of the back row, and proceed as in reading or writing; and in this way I hope to convey an idea approximating to the general character of the specimens as to their relative sizes; and, as I have stated above, if I wish to refer to any particular bloom, its position in the stand will at once be indicated by adding the number of its place in connection with it. *J. E.*

Amateur Tulip Society.—The half-yearly general meeting of this Society will take place at the Horns' Tavern, Kennington, on Monday the 6th instant, at six o'clock. The meeting, which has been made special, is for the purpose of taking into consideration an alleged case of non-compliance with the rules, on the part of one of the exhibitors. A ballot will take place for C. P. Lochner, Esq., who has been proposed as a member.

London Floricultural Society, *Sept.* 23.—Prizes to Amateurs for Dahlias in Classes—White: 1st, Mr. Noake, for Duchess. Blush Tipped or Mottled: 1st, Mr. Noake, for Mrs. Bacon; 2d, do. do.; 3d, Mr. Weare, do. Rose or Lilac: 1st, Mr. Hunt, for Fearless; 2d, do., for Queen of Beauty; 3d, do., for Fearless. Scarlet: 1st, Mr. Hunt, for Shylock; 2d, Mr. Noake, for Nonpareil; 3d, do., for Scarlet Gem. Yellow: 1st, Mr. Hunt, for Queen of Yellows; 2d, Mr. Noake, for Crocus; 3d, do., do. Maroon and Crimson: 1st, Mr. Hunt, for Sir F. Bathurst; 2d, do., do.; 3d, Mr. Noake, do. Purple: 1st, Mr. Hunt, for Mr. Seldon; 2d., do., do.; 3d, Mr. Noake, do. Orange-buff or Salmon; 1st, Mr. Hunt, for Duke of Wellington; 2d, do., for Seraph; 3d, Mr. Cowell, for Duke of Wellington. Light Fancy: 1st, Mr. Hunt, for Mrs. Hansard; 2d, do., for Florence Dombey. Dark Fancy: 1st, Mr. Hunt, for Gasparine; 2d, do., for Mr. Labouchere; 3d, Mr. Weare, for General Cavaignac. Varieties: 1st, Mr. Noakes, for Fame; 2d, Mr. Hunt, for Buffalo Girl; 3d, Mr. Cowell, for Princess Louisa. Nurserymen's Class.—White: 1st, Mr. Bragg, for Queen of the West; 2d, do., for Blanchfleur. Blush Tipped or Mottled: 1st, Mr. Bragg, for Hon. Mrs. Ashley; 2d, do., for Princess Radziville; 3d, Mr. Hunt, for do. Rose and Lilac: 1st, Mr. Bragg, for Admiral; 2d, do., do.; 3d, Mr. Bushell, for Fearless. Scarlet: 1st, Mr. Bragg, for Sir R. Peel; 2d, do., do.; 3d, Mr. Hunt, for Shylock. Yellow: 1st, Mr. Bragg, for George Glenny; 2d, Mr. Batten, for Crocus; 3d, Mr. Hunt, for Yellow Standard. Maroon and Crimson; 1st, Mr. Bragg, for Gem of the Grove; 2d, do., for Essex Triumph; 3d, do., for Louis Philippe. Purple: 1st, Mr, Hunt, for Mr. Seldon; 2d, Mr. Bragg, for Summit of Perfection; 3d, do., for Mr. Seldon. Orange-Buff and Salmon; 1st, Mr. Bragg, for Duke of Wellington; 2d, Mr. Hunt, for Seraph; 3d, Mr. Bragg, for Toison d'Or. Light Fancy: 1st Mr. Bragg, for Mrs. Hansard; 2d. do, for Miss Weyland; 3d, Mr. Hunt, for Highland Chief. Dark Fancy: 1st, Mr. Bragg, for Lady Grenville; 2d, Mr. Hunt, do.; 3d, Mr. Bushell, for Miss Blackmore. Varieties: 1st, Mr. Bragg, for Fame; 2d, do., Andromeda; 3d, Mr. Hunt, for General Negrier. Pansies—Nurserymen: Selfs: 1st, Mr Bragg, for Lucy Neal; 2d, do., for Ibrahim Pacha; 3d, do., for Cowper. Yellow Grounds: 1st, Mr. Bragg, for Pandora; 2d, do., for Nonpareil; 3d, Mr. Batten, for a seedling. White Grounds: 1st, Mr. Bragg, for Loveliness; 3d, do., for Duke of Wellington; 3d, Mr. Batten, for Hunt's Ellen. Roses—Light: 1st, Mr. Bragg, for Marquis d'Ailsa; 2d, do., for Duchess of Sutherland. Dark: 1st, Mr. Bragg, for Aubernon. Yellow: 1st, Mr. Bragg, for Sulphurea; 2d, do., La Pactole. Hollyhocks—Light: 1st, Mr. Bragg, for Maiden's Blush; 2d. do., for King of Roses: 3d, do., for Princess Alice. Dark: 1st. Mr. Bragg, for Formosa Improved; 2d, do., for President; 3d, do., for Enchantress. A First Class Certificate was awarded to Mr. Bragg for a seedling Dahlia named Phantom; also to the same for a Hollyhock, called Magnifica.

Norwich Horticultural, *Sept.* 17.—For 24 Dahlias, the first prize was awarded to the Rev. C. Fellowes, with Queen of Lilacs, Sir F. Bathurst, Mariella, Magnificent, Duke of Wellington, G. Glenny, Negro, Earl of Clarendon, Richard Cobden, Mrs. Seldon, Meteor, Princess Louisa, King, Fearless, Marchioness of Cornwallis, Mr. Seldon, Queen of the West, Grenadier, Gem, Summit of Perfection, Yellow Standard, Queen of England, Essex Triumph, Andromeda; 2d, Mr. T. Barnes, with Fearless, Negro, Sparkler, Magnificent, El Dorado, Princess Louisa, Snowflake, Duke of Wellington, General Faucher, Baltic, Duke of Rothsay, Earl of Clarendon, Richard Cobden, Queen of Lilacs, Fame, G. Glenny, Queen of the East, Nepaulese Prince, Nonpareil, Thames Bank Hero, Roundhead, Essex Triumph, Shylock, Sir F. Bathurst; 3d, Mr. Turner, with Mr. Seldon, John Edward, Queen of Lilacs, El Dorado, Magnificent, Thames Bank Hero, California, Princess Louisa, Sylph, Richard Cobden, Sir R. Peel, Mr. Palmer, Andromeda, Model, Sir F. Bathurst, Triumphans, Sir C. Napier, Barmaid, Nepaulese Prince, Admiral, Duke of Wellington, Fearless, Earl of Clarendon, and Duke of Cambridge; 4th, Messrs. Widnal and Davis. 18 Sorts: 1st, G. Holmes, Esq.; 2d, Rev. C. Fellowes; 3d, J. J. Colman, Esq.; 4th, Mr. Thos. Walpole. In addition to the varieties noticed above, we remarked Utilis, Beeswing, Princess Radziville, Almanzor, Captain Warner, Mrs. C. Bacon, Purple Standard, Napoleon, Lady St. Maur, Anticipation, Seraph, Privateer, and Cardinal Ferretti. 12 Sorts: 1st, Rev. C. Fellowes; 2d, Mr. Ablett; 3d, G. Holmes, Esq.; 4th, J. J. Colman, Esq.; 5th, Mr. W. Edwards. The sorts shown not already enumerated were, Toison d'Or, Crocus, Mynn, Jullien, and Queen of the Isles. 6 Fancy varieties: 1st, J. J. Colman, Esq., with Mrs Labouchere, Mrs. Hansard, Nihil, Elizabeth, Madame Wachy, and Jeanette; 2d, Rev. C. Fellowes, with Kingfisher, Conspicua, Pretty Polly, Jenny Lind, Rainbow, and Miss Jane; 3d, Rev. C. Fellowes, with Elegantissima, Mrs. Hansard, Frend Schnidt, Miss Elphinston, Elizabeth, and Madame Wachy. 12 Roses: 1st, Rev. J. Burroughes, who sent, among others, Géant des Battailles, Duchess of Sutherland, Jacques Laffitte, Souvenir de la Malmaison, Dr. Marx, Bourbon Queen, Augustin Mouchelet, and Dupetit Thouare; 2d, G. Holmes, Esq. 12 Verbenas: 1st, Rev. T. Burroughes, with Napoleon Buonaparte, Village Maid, Heloise, Eclipse, Defiance, Duchesse de Cazes, St. Margaret, British Queen, Morphee, Annie, Almanzor, and Comte de Serval; 2d, Mr. Edmonds; 3d, J. Gordon, Esq. Certificates were distributed to Dahlias Manilla (Fellowes), and George Villiers (Union), noticed last week; Verbena, no name (Edmonds), a purple with large white eye.

Slough Dahlia, *Sept.* 3.—This was a highly interesting meeting, and the blooms were in capital order. Amateurs; 12 varieties: 1st prize, Mr. Kirkpatrick, with Richard Cobden, Mrs. C. Bacon, Imbricata, Admiral, Sir F. Bathurst, Nil Desperandum, Snowflake, Frederick Jerome, Mr. Seldon, Purple Standard, Fearless, and Earl of Clarendon; 2d, Mr. Weedon, with Nil Desperandum, Model, Admiral, Duke of Wellington, Jullien, John Edward, Snowflake, Earl of Clarendon, Queen of the East, Yellow Standard, Mr. Seldon, and Sir C. Napier; 3d, Mr. Prockter, with Queen of Lilacs, General Negrier, Mrs. C. Bacon, Mr. Seldon, Richard Cobden, Mrs. Seldon, Standard of Perfection, Fearless, Admiral, Utilis, Duke of Wellington, and Princess Louisa; 4th, Mr. Hunt, jun., with Duke of Wellington, Magnificent, Marchioness of Cornwallis, Earl of Clarendon, Queen of Beauty, Hon. Mrs. Ashley, Black Prince, Mr. Seldon, Shylock, Fearless, Scarlet Gem, and Queen of the East; 5th, Mr. Cook, with Earl of Clarendon, Richard Cobden, Abigail (?), Negro, Fearless, Absolum (?), Essex Triumph, Mrs. C. Bacon, El Dorado, Mr. Seldon, Queen of Lilacs, and Sir F. Bathurst; 6th, Mr. Hopkins, with Mr. Seldon, Toison d'Or, Queen of Lilacs, Mrs. Seldon, Scarlet Gem, Beauty of Hants, Duke of Wellington, Beeswing, Yellow Standard, Fearless, Richard Cobden, and Seraph; 7th, Mr. Ford, with Duke of Wellington, Essex Triumph, Mrs. Seldon, Magnificent, Blanchdeur, Mr. Seldon, Earl of Clarendon, Marchioness of Cornwallis, General Faucher, Grenadier, Hon. Mrs. Ashley, and Sir R. Peel; 8th, Mr. Humber, with Princess Radzivill, Snowflake, Fearless, Mrs. Seldon, General Faucher, Scarlet Gem, Negro, Richard Cobden, Hon. Mrs. Ashley, Mr. Seldon, and Mrs. C. Bacon. 6 new varieties: 1st, Mr. Weedon, with Leda, Jullien, Duke of Rothsay, Regina, Admiral, and Gem of the Grove; 2d, Mr. Prockter, with Mrs. Hansard, Napoleon, Admiral, Sir C. Napier, Yellow Gem, and Nepaulese Prince; 3d, Mr. Holder, with General Faucher, California, Sir R. Peel, Hon. Mrs. Ashley, Gem of the Grove, and Admiral; 4th, Mr. Cook, with Sir C. Napier, Jullien, Mrs. Hansard, George Glenny, Miss Herbert, and Regina. 6 Fancies: 1st, Mr. Prockter, with Miss Compton, Gasperine, Highland Chief, Mrs. Hansard, Elizabeth, and Contribution; 2d, Mr. Ford, with Discount, Elizabeth, Lady Grenville, Miss Blakmore, Lady Cullum, and Floral Beauty. Dealers, 24: 1st, Mr. Turner, with John Edward, El Dorado, Mr. Seldon, Leda, Negro, Duke of Wellington, Yellow Superb, Magnificent, Fearless, Black Prince, Queen of Lilacs, Grenadier, Mrs. Seldon, Princess Louisa, Richard Cobden, Mr. Palmer, Sir C. Napier, Beauty of Kent, Andromeda, Snowflake, Mrs. Saunders, Princess Radzivill, Marchioness of Cornwallis, and Jullien; 2d, Mr. Bragg, with Princess Radzivill, Earl of Clarendon, George Glenny, Nil Desperandum, Magnificent, General Faucher, El Dorado, Mr. Seldon, Duke of Wellington, Fearless, Carminia, Hon. Mrs. Ashley, Sir R. Peel, Yellow Superb, Sir F. Bathurst, Mr. Palmer, Victor Boheim, Seraph, Miss Chaplin, Black Prince, Admiral, Essex Triumph, Queen of the West, and Fame. 12 Fancies: 1st, Mr. Turner, with Miss Compton, Jeanette, Highland Chief, Elizabeth, Mrs. Hansard, Dulcinée, Nonsuch, Flying Dutchman, Rainbow, Miss Weyland, King Fisher, and Gasperine; 2d, Mr. Bragg, with One in the Ring, Flying Dutchman, Keepsake, Highland Chief, Miss Pope, Kingfisher, Lady Cullum, Gasperine, Madame Wachy, Forget-me-not, Lady Grenville, Mrs. Hansard. First Class Certificates were granted to Una (Keynes), a bold white, which has been very successfully shown during the season; Malvina (Turner), mottled lake and white; Morning Star (Turner), brilliant scarlet orange; Miss Mathews (Bragg), remarkably bright, full, deep and bold, in every qualification an improvement on Lady Grenville, a variety it much resembles; Flora M'Ivor (Keynes), was shown; Miss Ward (Turner), Absolum (Cook), golden buff. Hollyhocks: 1st, Mr. Dyson, with Magnum Bonum, Bella Donna, Rosy Queen, Queen, Sulphurea, Lady Smith, Subram, Rosea grandiflora, Enchantress, Rosea Alba, Caroline, and Model of Perfection; 2, Mr. Holder. 12 spikes, mostly seedlings of considerable promise, were set up by Mr. Bragg. Pansies were contributed in good condition by Mr. Bragg and Mr. Turner. 36 bunches of Roses were staged by Mr. Wilkinson, of Ealing. Although not floricultural, I cannot help mentioning that two well ripened old Queens, weighing 6 lbs. 12 oz. and 5 lbs. 11 oz, were exhibited by Mr. T. Frost, gr. to E. L. Betts, Esq., of Preston Hall. It would be unfair to permit such fine fruits to pass unnoticed.

Stoke Newington, *Sept.* 25.—No less than 12 collections of Dahlias were staged on this occasion by Amateurs, each with 12 varieties, and 8 were rewarded. The 1st Prize, for 12 dissimilar blooms, was voted to Mr. James, for Mrs. C. Bacon, Danecroft Hero, Queen of Lilacs, Mrs. Seldon, Nil Desperandum, Elizabeth, Duke of Wellington, Admiral, Fearless, Yellow Standard, Sir F. Bathurst, and Shylock; 2d, to Mr. Cook, for Mrs. C. Bacon, Scarlet Gem, Queen of Lilacs, Earl of Clarendon, Fame, George Glenny, John Davis (Cook), Fearless, Essex Triumph, Absolum (Cook), Elizabeth, and Duke of Wellington; 3d, to Mr. J. Edwards, for Goliath, Queen of Lilacs, The Hero, John Edward, Mr. Seldon, Richard Cobden, Mrs. Seldon, Fearless, Miss Chaplin, Snowflake, Duke of Wellington, and Thames Bank Hero; 4th, Mr. Black, for Mr. Herbert, Mr. Seldon, John Edward, Princess Louisa, Thames Bank Hero, Queen of Lilacs, Mrs. Seldon, Fearless, Sir R. Peel, Goliath, Miss Spears, and Shylock; 5th, Mr. Weedon, for Duke of Wellington, Admiral, Nil Desperandum, Earl of Clarendon, Fearless, Essex Triumph, Mr. Seldon, Duke of Cambridge, John Edward, Queen of Beauty (Drummond), Psyche, and Sir F. Bathurst; 6th, Mr. Thurley, for Thames Bank Hero, Duke of Wellington, Mr. Seldon, Princess Louisa, Fearless, Purple Standard, Mrs. C. Bacon, Napoleon, General Negrier, Queen of the West, Scarlet Gem, and Queen of Yellows; 7th, Mr. Holmes, for Frederick Jerome, Mrs. Seldon, Thames Bank Hero, Queen of Lilacs (5?), Fearless (6?), Duke of Wellington, El Dorado, Miss Vose, Shylock, C. Turner, Sir F. Bathurst, and Scarlet Gem; 8th, Mr. Bennett, for Mrs. C. Bacon, Mr. Seldon, Queen of Beauties, The Hero, Thames Bank Hero, Queen of Lilacs, Imbricata, Princess Louisa, Duke of Cambridge, Crocus, John Edward, and Fearless. In the Dealers' Class, for 24 varieties, Mr. Gurney received the 1st prize. 6 Fancies: 1st, Mr. Black, with Highland Chief, Rachael, Miss Compton, Lady Grenville, Mrs. Hansard, and Queen of Fairies; 2d, Mr. J. Edwards, with Miss Compton, Mrs. Hansard, Highland Chief (3), Queen of Fairies, Flying Dutchman (5), and Captivation; 3d, Mr. James, with High-land Chief, Mrs. Hansard, Elizabeth, Miss Compton, Rainbow, and Madame Bresson. Fine spikes of Hollyhocks were staged by Mr. A. Parsons, of Ponder's-end: they consisted of Pilot, Aurantia Superb, California, Hero, Triumphant, and Beauty. These are Seedlings which are wholly in the possession of the Exhibitor: Enchantress, Obscura, Charles Baron, and Model of Perfection, one their origin to Mr. Chater; these, with Delicata and Rosea grandiflora (both Baron's), completed the dozen. First Class Certificates were awarded to Dahlias—Ariel (Turner), a bold and apparently pure white; to Miss Ward (Turner), yellow, with white tip (fancy); to Dr. Frampton (Rawlings), one of the most successful flowers of the year; and to Sir F. Thesiger (Rawlings), a lilac of great promise. Other Seedlings consisted of Morning Star (Turner), Malvina (Turner), Louisa Glenny (Rawlings), deep yellow, and a flower of which the raiser entertains the highest opinion; Defiance (Rawlings), an extra-sized bush white; Sarah (Pink) mottled lake; Lord Lyndhurst, deep maroon, with white tips; Rose of England (Rawlings), cheerful rose pink; Scarlet King (Green), previously described, as was also George Villiers (Union), Miss Merry (Union), fancy. The prizes were handed to the several winners in the course of the evening.

Dahlias: *Uniacke.* Your letter should have been addressed to the secretaries of the different societies which offer silver cups for Dahlias. For my own part, I consider them worthy of all the encouragement they receive. They are certainly everybody's flower; but instead of that detracting from their value, I consider it "heavy odds" in their favour. What would floral meetings be without them curing August and September? *J. E.*

Hollyhocks: *C J S.* Try the following:—Model of Perfection, Walden Gem, C. Turner, Magnum Bonum, Comet, Sulphurea Perfecta, Rosea Grandiflora, Enchantress, Rosy Queen, Napoleon, Sir D. Wedderburn, Lady Clark *alias* Queen of England, General Bem, Obscura, Mr. C. Baron, Spectabilis, Rubens, President, Bella Donna, Waterford Surprise, Susannah, Safranot, Swansdown, and Yellow Model of Perfection. *J. E.*

Pinks: *J K.* The second delivery has arrived. Julia (Young), sent out by Keynes is a flower much in the way of, and an improvement on, Mary Ann (Jelff). *J. E.*

Roses: *J C.* Judging from the appearance of the petals, for the bloom had fallen to pieces when received, the Rose much resembles the variety mentioned; we should like to see it in a younger state. *J. E.*

SEEDLING FLOWERS.

Pansy: *W D.* Withered and past recovery.*

## Calendar of Operations.

*(For the ensuing week.)*

PLANT DEPARTMENT.

Watering is an operation which must at this season be performed with increased caution; and the little that is requisite should be given in the morning, when the ventilation is first increased above the ordinary night quantity. To assist in drying up the damp which is unavoidably engendered both by the watering and the natural circumstances of the season, a moderate fire should be lighted at the same time, except when the sun is itself sufficiently strong for the purpose. The application of artificial heat during the day will render it necessary to open the ventilators wider, to allow free egress for the evaporated moisture. Extremes, however, must in this, as in every case, be carefully avoided, keeping in mind that the object in using the pipes or flues during the day is merely to free the house and its atmosphere from superfluous moisture, and that the existence of the latter is calculated to be injurious. A very arid atmosphere is not less irreconcileable with the well-being of plants which are in the possession of healthy foliage. The medium course must be the one pursued, regulating the amount of air and fire heat, so as to effect the desired purpose by the usual time of reducing the air in the evening, when the heat should be checked by means of dampers in the flues, or stop-cocks in the hot-water pipes. After such treatment during the day, the heat enclosed within the house will generally be sufficient for greenhouse plants at night, as they will endure a much lower temperature when comfortably dry, than under different circumstances. Stove plants require much the same treatment at this season, taking care, of course, that the temperature be proportioned to their natural requirements. If their wood is properly matured, they will stand uninjured in a very low temperature. Ixias, Sparaxis, and other Cape bulbs of that kind, should be repotted, and plunged in a cool frame, or they may be planted out in a frame of prepared soil, and their elegant blossoms used for placing in the glasses. In favourable localities, it is not necessary to use a frame, as they may be planted in the ground in a nicely-prepared border, and left there for several years. It is not by any means a good plan to part these plants too frequently, as they are seldom very productive of flowers the first year after they have been disturbed. If grown in pots, it will therefore be better, unless they are very much crowded, to be content with

carefully removing as much of the soil as can be managed, without disturbing the bulbs, and replacing it by some fresh soil. For the stronger-growing kinds, the compost should be light and sandy, containing a considerable admixture of peat; but for Gladioli, and others of similar growth, a soil somewhat richer and stronger is needed. In all the plant-houses, let most scrupulous cleanliness and neatness prevail, and spare no pains to give them a gay and cheerful appearance; as they may, by good management, be made a luxury, indeed, and will afford pleasure and gratification to their proprietors.

FORCING DEPARTMENT.

As the length and strength of daylight is now so rapidly diminishing, all the glass sashes of the different structures should be washed; and to render the good effects of this ablution as permanent as possible, the mats, &c., which are used for covering at night, should be carefully removed to the sheds during the day, and kept perfectly clean, or the sashes will soon be as dirty as ever. PINERIES.—Montserrat Pines, which are now showing or flowering, will be invaluable in early spring, and should be assisted by every available means. A steady bottom and top heat must be maintained, and the most careful attention paid to watering. Let them have all the light possible, especially while they are in flower, at which time air must be liberally admitted during the day, to dry the atmosphere, and to prevent the monstrous growth of their crowns. VINERIES.—In the Vineries, containing winter Grapes, every exertion must be made to prevent damp. Any faulty places on the roof, which admit drip, should be repaired, and slopping of water entirely avoided. Where there are beds of tan or leaves for plunging plants in during the summer, it is a good plan to surface the beds with dry sand, to keep down evaporation. Any Grapes which are not yet properly ripened should be kept a little warmer during the day; this will at the same time assist to ripen the wood. Let all growing laterals be constantly removed, to allow of the freer admission of light; and in cutting the fruit from spurs, prune back at once to the most promising eye near the base. MUSHROOMS.—Continue to make up successional beds, as the season advances, and spawn and soil the earlier ones, as they are ready. It will be found time and material well bestowed to spawn the beds twice, with an interval of a fortnight between the two spawnings; by this simple means, we ensure a regularity of crop all over the beds, and the supply is more abundant and more permanent. Let the beds be spawned 1 foot asunder, in the first instance, leaving marks where it is inserted; and plant the second lot midway between the first. Keep the floor constantly moist, and the house quite dark. Let the admission of fresh air be from the lower part of the house, through the floor, if possible, and have ventilators so arranged that the evaporation may pass off freely at the top.

FLOWER GARDEN AND SHRUBBERIES.

Little can be done in this department, except in cleaning and removing annuals and half-hardy plants, as they cease to be effective; and as the various masses of these are removed, the beds should be at once filled with their winter and early spring occupants, whether bulbs or dwarf evergreens. In planting the former no time should be lost; but if a press of other work renders it necessary to postpone the latter, let the ground be neatly dug over, to give it a clean and fresh appearance for the time being. Attend to the pruning and training of climbers, and the staking and tying of any plants requiring artificial support. Very great exertions should be made at this season to render the neat and orderly keeping of a place conspicuous, that it may in some degree compensate for the gradually fading beauty. As the leaves of some of the trees are now beginning to fall, it becomes every day a more difficult matter to keep the grounds in order, and renders the most industrious perseverance necessary to maintain them in a creditable condition. Let the necessity of intense exertion be impressed upon the mind of every propagator; every day's delay in putting in cuttings at this season lessens the short time that they would have for striking root and strengthening themselves before winter. Unless this work is already completed, all hands should be brought to bear upon it, as the early summer display for next year depends considerably on the greater part of the stock being propagated in the autumn. Attend to those in progress, by judicious watering, shading, and ventilation; remove all dead leaves, and carefully cut away every attempt at producing flowers. As soon as the cuttings are rooted, let them be gradually but speedily inured to the open air, that they may form sturdy healthy plants before winter. If frames in winter cannot be afforded for the autumn struck Roses, they should be planted in rich soil, in well sheltered borders in the reserve garden, that they may have time to establish themselves. The Tea-scented and other tender kinds should occupy a compartment by themselves, where they can be conveniently protected from frost. Brompton, Queen, and late Ten-week Stocks should be transplanted into light soil, in a warm, dry border, where they can be protected by placing a wooden frame over them during winter. Take advantage of favourable weather for gathering seeds; those of biennials and perennials should be cleaned immediately, and sown in the reserve garden. A considerable time, often amounting to an entire season, is saved by sowing many such plants in autumn.

FLORISTS' FLOWERS.

Rough winds and an early frost have made Dahlias appear rather worse for their influence. We would recommend soil to be drawn round the stems without delay; look the plants over, and gather any seed which is ready; cut away broken shoots, and make the plants as neat as possible under the circumstances. Have some good Deal tallies made and painted, to which stout zinc wire should be attached; these will be ready to label the roots when they are lifted from the ground. PANSY AND PINK Beds should now have their final supervision; fill up any blanks which may have occurred, and stir the soil lightly between the plants. Any stock of late struck pipings or cuttings should also be set out, taking the precaution to hoop the bed over, as the heavy rains of autumn are extremely prejudicial to them. Potting Carnation and Picotee layers ought now to be finished or nearly so. Take care that the plants are not kept in a close frame too long; after a lapse of five or six days the lights must be gradually raised, till they are removed all together, only covering in heavy rain. A slight hotbed of Oak leaves or other material, will be of great service in assisting those which are but moderately rooted. Do not in the multiplicity of other things forget "the Tulip," early planting is advisable, in fact, any time from the middle of the month when the compost IS DRY; that it should be dry is absolutely essential.

KITCHEN GARDEN.

Do not, because the season is far advanced, allow the destroying of weeds to be neglected, as many of them will yet perfect their seeds, and increase out-door difficulties another year. We have sometimes seen a gardener attend energetically to this during the earlier part of the season, but by suffering the autumn weeds to grow and ripen, he had more than his old work to do again the next year. The earthing up of Celery and Cardoon crops had better not be longer deferred, lest they should be injured by frost; the operation should be performed when the ground is dry, finishing the work at one operation. This plan for the late crops is excellent, as both these vegetables are found to keep a month or two later than plants earthed up early; and the work is done at less expense when done at one operation. Take advantage of wet weather to rub seeds out, rope Onions, and twist hay-bands for Cardoons; and let the most useful men help forward with the work in the other departments.

State of the Weather near London, for the week ending Oct. 2, 1851, as observed at the Horticultural Garden, Chiswick.

## Notices to Correspondents.

BIRDS—THE MOULTING BULLFINCH: *J L.* It is to be regretted that some of our good friends pass over our remarks, week by week, without giving heed to our counsels. They simply read what concerns themselves at the time, and do not lay up store of information for the future. This is obviously wrong. Your bird is infested with vermin; and his new feathers being now about to appear, his invaders torment him sadly by the irritation they produce in his skin. You have acted most unwisely in oiling his extremities, and must never attempt it again. As the case of your sufferer so closely resembles that of "the Canary" (see notice to "Amanda"), prescribed for (p. 616) last week—we refer you to it at once for detailed instructions to effect a cure; but remember, your bird must be put in a new, close cage, and kept warm. *W. K.*—THE MOCKING BIRD: *J T.* Yes; it *was* a singular coincidence, that in the very same paper containing our advice to a correspondent *not* to procure one of these creatures, a notice should appear from another hand detailing his strong points, and showing up his true character and accomplishments. We think, after what has been said by so dispassionate an observer of his powers of mimicry, we hardly need repeat our caution to a lover of birds; unless it be to speak of his additional "excellencies" in copying most faithfully the squeaking of a pig and the cackling of a goose; also of his giving by no means an unsuccessful imitation of the braying of a refractory and salient young donkey. For his size (he is not larger than a small thrush), the mocking bird certainly is a most wonderful creature; and though of a plain and homely presence, yet if noise, incessant uproar, and incoherent jargon be recommendations to favour, then is the palm *his*. By the way, the Uran-utan, at the Zoological Gardens, Regent's Park, is in high favour among the lady visitors there; and this reminds us that ours is "a *one*-sided opinion" only; and that "there is no accounting for taste." *W. K.*—THE GOLDFINCH: *J B.* Your nestling bird being of a nearly black colour, is no detriment to him. On the contrary, an occasional variety of this kind is pleasing. We have had black skylarks, white linnets, &c., &c.; and always found much to admire in them. Their song, as in the case of your goldfinch, has been always fine; and Nature lavish in her additional gifts, to atone for her deviation from a general rule. When your bird moults, it is probable you will observe yet another change. *W. K.*—THE WOODLARK: *Amelia S.* You did wrong to purchase so wild a bird. The legs of these birds are brittle as the finest glass; and if perchance they get caught in the wires, a fracture of one or both is inevitable. Your little friend (we say it in all kindness), *must be* killed. These birds require to be hung moderately high, and kept out of the reflection of all shadows. Their timidity is extreme. *W. K.*—THE BLACKBIRD: *Jane L.* You have purchased one of a late brood. He is suffering from cramp; and unless kept very warm, and cosseted in doors, you will lose him. At this advanced period of the year, you should always procure strong, full-feathered birds. *W. K.*—THE THRUSH. *Ellen A.* For once, you have puzzled us. We cannot, nor can any other person, tell you how to distinguish the male from the female at this season. As the whole three of your prisoners appear equally handsome and sprightly, cage them all off separately. Before Christmas, the males will be loud in song. Such as remain *silent* after this—strange as it may appear!—are *females*. *W. K.*—THE LINNET: *W A D.* He is moulting very favourably; but *must* be kept warm. The prevailing winds search every part of these little creatures' constitution. Give, in addition to what you mention, one or two bruised hemp-seeds twice a week. *W. K.*—THE ASTHMATIC GOLDFINCH: *Isabella W.* Although the account you give us of your pet's calamities is a grievous one, yet there is good hope of our effecting a cure. In the first place, he is over-fat. To remedy this, feed him sparingly; and let him fly daily in a spacious room, where the sun has access through the windows. This exercise will gradually reduce his bulk, and eventually restore his fair proportions. His difficulty of breathing will also be lessened day by day. As he progresses towards recovery, vary his food as much as possible, and give him the use of a bath. At present, living in confinement is quite against all reasonable hope of convalescence; the truth of which, to a reasoning mind, will soon become apparent. You have done wrong in lending your friends so many Nos. of the *Gardeners' Chronicle;* you have thereby incurred much risk of destroying your set, for there is an impossibility of obtaining some particular Nos. *W. K.*—THE CANARY: *Annie J.* The "birds" *have* arrived, in fine preservation, and we shall *prove* our "affection" for them, *D. V.*, on the first leisure day. *W. K.*—THE BLACKCAP: *J C Ewan.* The *spirit* of your bird is at once proved by his sprightliness and vivacity, after travelling so very long a distance. As he shirks the larger bath, this is all the better; as the season is now too far advanced to admit of the daily use of such a dangerous winter luxury. *Cramp* would be the inevitable result of such an indulgence. There can be no objection to his dipping his head into the glass which holds the water given him to drink. We cannot procure for you the first 17 Nos. of our "Treatises on Song Birds," at any price; and this proves THE NECESSITY, as we have before urged, of our readers providing themselves regularly *every week* with whatever number of copies they may require. *W. K.*—[Our accumulating correspondence renders it necessary to postpone all further Answers, on subjects connected with Ornithology, until next week. *W. K.*]

BOOKS: *A B.* "Paxton's Flower Garden" may possibly suit you.

ELDERS: *Sambucus.* It is the white berried kind. A variety of the common black sort, well known to collectors, but not esteemed.

ELEVATION ABOVE THE SEA: *An Old Gardener.* We will inquire and tell you next week.

FAN PALM: *H B.* If your "Fan Palm" is a hardy kind, then it may go along with Agave, and will merely require shelter from *wet* and severe cold in winter. If your contrivance will do this, it may answer.

FIG TREES: *Gallicus.* Starve them, and they will probably fruit with you.‡

FISH-PONDS: *J G C.* We have long been endeavouring to find a contributor upon this subject; but a person really acquainted practically with the subject has never yet turned up. We are still inquiring.

FRUIT: *A Constant Sub.* The columns of last and this week will, we trust, give you the information you desire.

HEATING: *M E B.* An Arnott stove will not answer well. Had you not better inquire about the Limerick stove mentioned to-day in a Leading Article? It is far more likely to suit you.

NAMES OF FRUITS: *Occasional Tourist.* Although the seedling Apple may be, as you state, a good bearer and a good cooking Apple, yet its form and size are not such as would render it desirable for general cultivation.‖—*E W W.* The Pear from a tree 80 years' old is one of those called Sanguinole. It has, doubtless, been originally obtained from France, where it has long existed.‖—*Launceswood.* 1, 9, 12, 13, 14, 24, Hawthornden; 2, French Crab; 3, Dumelow's Seedling; 4, 16, Minchall Crab; 5, Scarlet Nonpareil; 8, 36, Sam Young; 10, Golden Pippin; 11, 25, King of the Pippins; 15, 22, Wyken Pippin; 17, 35, Dutch Mignonne; 18, 19, Spice Apple; 20, White Winter Colville; 23, 38, things apparently worthless; 26, Court of Wick; 27, Dutch Codlin; 31, Northern Greening; 32, Red Quarrenden; 33, Scarlet Crofton; 37, Blenheim Pippin.‖—*H R S.* 3, Loan's Pearmain; 4, 8, Yorkshire Greening; 5, 13, Fearn's Pippin; 6, Wormsley Pippin; 9, London Pippin; 11, Hall Door; 15, Lamb Abbey Pearmain; 16, Jargonelle ‖—*A Constant Reader.* 3, Court of Wick; 5, Rhode Island Greening; 7, Fearn's Pippin; 8, Nonpareil; 9, Beauty of Kent; 11, Downton; 12, Yellow Ingestrie; 16, 27, Hawthornden; 22, Minchall Crab; 23, French Crab; 24, Hollandburg; 25, Pearson's Plate; 26, Court-pendu Plat; 19, Louise Bonne (of Jersey); 21, Beurré Rance.‖

NAMES OF PLANTS: *A Lover of Plants.* By Rogersia is probably intended Rogeria; but your plant does not belong to that genus. It is rather a Sesamum of some sort, and perhaps S. occidentale.—*Leyton.* Dendrobium chrysanthum.—*A E S.* Cupressus macrocarpa. ¶—*R J G.* Lastrea spinulosa. *S.*—*Erzeroum.* 11, Fritillaria tulipifolia.—*A Sub.* Pavicum miliaceum.—*John Hills.* Torenia concolor, a half-stove plant, to be grown in a warm moist atmosphere during summer, and to be kept cool and rather dry in winter. You cannot give Vines a better soil than good calcareous loam, with the grassy turf chopped up with it and half rotted.—*F H M.* Narthecium ossifragum.—*A Constant Reader, Walmer.* They appear to be young plants of the common Henbane.—*A B.* Tacsonia pinnatistipula. A few inquiries are unanswered.

RINGING FRUIT TREES: *Expertus.* The best season for ringing Pear trees which bear no fruit, is when the bark runs in spring.‡

ROSES: *E G.* We should have no fear of the plants. They cannot have made fine heads without making roots also. The land has suited them well, that is all.—*J W.* Your Roses, with dormant buds, may be removed this autumn with perfect safety, if they do not receiveany check; and in that case may bloom next summer.‡

TOMATO SAUCE: *K.* To make this, when the Tomatoes are quite ripe, cut them in two, press out the pulp, and separate the seeds; then put them in a skillet, with some savoury sauce, and a little salt. When of the thickness of Pea-soup, rub it through a coarse cloth, boil it to the consistence of marmalade, put it into jars, and in a day or two after pour over it lard or butter, and tie it down with oiled paper. For further information, see page 653, vol. 1847.‡

VINES: *R Josling.* If your variegated plant is really a Vine, it shows that Vines may become variegated like other plants. The variety is pretty, and we do not recollect having before seen it.

MISC.: *Sencx.* With much deference to the name you assume, we must be permitted to express our own opinions as well as to publish those of others. It is not worth going again over arguments formerly brought forward, on both sides of the question; we shall, therefore, merely add that we see nothing to cause a change in the view we have taken of a very unimportant matter.

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS, AS THE ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

THE LONDON MANURE COMPANY beg to offer PERUVIAN GUANO, warranted perfectly genuine; Superphosphate of Lime, Wheat Manure, Concentrated Urate, Irish Peat Charcoal, Gypsum, Nitrate of Soda, and every artificial Manure, on the best terms. Also a constant supply of Salt for Agricultural purposes, at a low rate. English and Foreign Linseed Cake, Rape Cake, &c.

EDWARD PURSER, Secretary, Bridge-street, Blackfriars.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Clover Manure, per ton ... ... ... | ... | £11 | 0 0 |
| Turnip Manure, do. ... ... ... | ... | 7 | 0 0 |
| Superphosphate of Lime ... ... | ... | 7 | 0 0 |
| Sulphuric Acid and Coprolites ... | ... | 5 | 0 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per ton, in dock. Sulphate of Ammonia, &c.

HIGHLAND AND AGRICULTURAL SOCIETY. EDINBURGH VETERINARY COLLEGE.

The Committee of the Highland and Agricultural Society of Scotland, appointed to superintend the Veterinary College, hereby intimate that the Session will commence upon Wednesday, the 5th of November. The Course of Study will be conducted as follows:—1. Zoïatrics, including the Anatomy, Physiology, and Pathology of the Horse, Neat Cattle, Sheep, Pig, and Dog, Stable Management, and the Business of the Forge, by Professor Dick. 2. The Principles of Chemistry and Pharmacy, by Dr. George Wilson, F.R.S.E. 3. General Zootomy and Demonstrations, by Mr. Barlow, V.S. 4. Zootherapeutics, comprising Veterinary Materia Medica, and Dietetics, by Mr. Dun, V.S. 5. Practical Pharmacy, by Mr. Worthington, V.S. By order of the Committee,

Edinburgh, Sept. 27, 1851. JN. HALL MAXWELL, Sec.

SMITHFIELD CLUB, 1851.—CHRISTMAS FAT CATTLE SHOW.—Prize Sheets and Blank printed Forms of Certificate may now be obtained on application to the Honorary Secretary.

The last day for receiving Entries is SATURDAY, THE 15TH NOVEMBER, 1851.

The ANNIVERSARY DINNER of the CLUB will take place at the FREEMASONS' TAVERN on the WEDNESDAY of the Show Week, instead of the Friday, as heretofore.

B. T. BRANDRETH GIBBS, Hon. Sec.,
Corner of Half Moon-street, Piccadilly, London.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description; but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected on the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

DURABLE OUT-DOOR PAINT.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the Nobility, Gentry, and Clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Wood, Iron, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice. Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON and SON, No. 9, Great Winchester-street, Old Broad-street, Royal Exchange, London. No Agents.—All orders are particularly requested to be sent direct.

BAKER'S PHEASANTRY, Beaufort-street, Kings'-road, Chelsea, by special appointment to her Majesty and H.R.H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street, London.

PURVEYOR TO HER MAJESTY, H.R.H. PRINCE ALBERT, AND THE KING OF THE NETHERLANDS.

JOHN BAILY, 113, Mount-street, Grosvenor-square, London, Dealer in all sorts of USEFUL AND ORNAMENTAL POULTRY; Domesticated Wild Fowl; Gold, Silver, and common Pheasant Eggs for Hatching; all sorts of Fancy Fowls' Eggs, large Aylesbury Ducks, &c.

BAILY'S registered PHEASANT AND POULTRY FOUNTAINS, by which Birds are ensured a supply of clean and wholesome water, and the lives of thousands of Chickens and Pheasant Poults saved—14 quarts, 17s. 6d.; 7 quarts, 15s. 6d; 3 quarts, 13s. 6d. Drawings and particulars forwarded by post on application.

BAILY'S "Hints for the Management and Fatting of the Dorking Fowls for the Table," price 1s. 6d.

MR. J. C. NESBIT, F.C.S., F.G.S., Consulting and Analytical Chemist, Laboratories, 38, Kennington-lane, London.—PRIVATE INSTRUCTIONS in Chemical Analysis, and the most approved methods of making ARTIFICIAL MANURES. Analysis of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

PERMANENT PASTURE.

HENRY ROGER SMITHE, of Eastling, Faversham, Kent, informs the public that his mixtures of the NATURAL GRASSES and small CLOVERS, gathered under his own superintendence, including every sort necessary to form a Permanent Pasture, on various soils, are now ready; delivered on the South-Eastern Railway, at 1l. per acre, allowing three bushels per acre. Also Seeds for Lawns, and for renovating old pastures; the nature of the soil to be sown should be particularly stated. Instructions for sowing will be sent with each parcel. Seeds are this year comparatively scarce; the Advertiser has, however, determined not to raise his prices, considering the ruinous effects of free trade on Agriculture, and depending on the extension of his business for a return of his outlay.

IRISH FARMS TO LET.

MR. THOMAS MILLER, STOCK AND SHARE BROKER and LAND AGENT, will forward the list of Irish Farms which he has to Let, upon receipt of TWO POSTAGE STAMPS. He will give letters to view the Farms, and makes no charge whatever to parties who take Farms through him. For greater convenience he will immediately open an office in Dublin.

Mr. MILLER having been sanctioned by the Commissioners of the Irish Incumbered Estates Court, to register properties for sale in that Court, parties wishing to purchase properties either publicly or privately, may make application to him.

6, St. Andrew-square, Edinburgh.

BIRMINGHAM CATTLE SHOW, 1851.—The Certificates of Entry for Cattle, Sheep, Pigs, and Poultry, are now ready, and, with the Prize Lists, may be had on application to Mr. EDWARD LATHBURY, at the Office, No. 2, Insurance-buildings, Union-passage, Birmingham. Intending Exhibitors are particularly requested to mention the nature of the Stock for which they require Certificates, as a separate form is necessary for each Entry.

Birmingham, Oct. 4, 1851. T. B. WRIGHT, Hon Sec

The Agricultural Gazette.

*SATURDAY, OCTOBER* 4, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

THURSDAY, Oct. 9—Agricultural Imp. Soc. of Ireland.
THURSDAY, — 16—Agricultural Imp. Soc. of Ireland.

NEVER at any time or in any country has agriculture afforded a wider or more important range of subjects for discussion than it does in this, at the present moment. It is economic, social, and political; scientific, practical, moral and educational: it is talked from the castle to the cottage, from the palace to the workhouse. It is clerical and yet secular; provincial, and yet fashionable. It has become common ground, on which all men meet. There seems to be but one thing which agriculture is *not*: it is not yet *statistical*: true to its old habit, it *keeps no accounts*. The national character follows the individual. But this may mend perhaps; when Farming Balance-sheets are as "plenty as Blackberries," it is just possible that some green member may startle the House, by moving for 'a Return of the amount of Wheat grown in England, Wales, and Scotland, respectively, in the year eighteen hundred and fifty' something: a very natural thing to wish to know, a very proper thing that 'the House' *should* know: but what a consternation it would make, this green member's motion! Who could supply it? who answer it? who give even a decent guess at it? 'On your oath' Mr. CHANCELLOR of the EXCHEQUER, was the Wheat grown in this kingdom, in the said year, *under* 12 millions of Quarters, or *over* 24!

What a shame this is. While all sorts of absurdly incompatible opinions stare each other boldly in the face, while anybody may say anything, without the least fear of contradiction, or may be contradicted point blank without the least possibility of reply, resource, or reference, upon a subject of such importance in this empire, and in every empire; what a shame this is, that you may cry 'doubles or quits' or give even a wider range of guess-room; and not the cleverest minister of the Crown can put you right—or prove you wrong!

For years that may be counted by hundreds—and you shall hardly know where to stop—this country has been governed by its Landlords: nor do we know any particular reason why it should not be; but look at the result. 'Charity begins at home," but not statistics. We know every bale of Cotton that comes in, every ton of Coals or Iron that goes out; every pound avoirdupois of Tea or Coffee, Sugar or Tobacco that is consumed: but as for Bread or Wheat! we literally know no more what proportion the four millions of quarters we imported last year bore to our home supply, and our average consumption, than we do of the ratio between the Atlantic gales we breathe in November to the Siberian blasts that chafe our lungs in March. Is it not too bad, that up in arms as we are about Protection and Free trade, busy with arguments, earnest in assertion on one side and the other—we are ignorant of the first elements of our lesson. With an import of four millions of quarters in Wheat alone, staring us in the face, we have some of us the hardihood to say that with 'Farming as it should be' we ought to be able to *export*: and this we say, as utterly in the dark as to what may be called the *major premiss* of the whole question, namely the actual ratio of our own produce to our consumption' as if Wheat were one of those immensurable commodities, like air or water, whose value, the economists tell us, lies not in the exchange, but in the use alone.

Yet it takes some trouble to grow our four or five quarters of Wheat on an acre of land; and if we find it so difficult and sometimes so provoking to count the cost, we might at least take the trouble to count *the acres!* Is it so very difficult? Is there any motive for concealment? There once may have been, perhaps. It is just possible that when Wheat was a kind of premium article, selling at a premium price, it might not have been quite so convenient, all things considered, to have a local 'enumerator' poking his nose and his note-book over the farm, jotting down the number of acres and the probable yield, once, or even twice perhaps, in every season. But that time seems gone by: a terrible indifference in this respect has come upon us. The reasons for wishing to know the truth remain; those for concealing it have departed.

It was stated in the Corn-trade reports, not three months ago, that the price of flour in Paris had suddenly risen eight francs per sack. Whence came this sudden convulsion upon the price of Flour in France? France, until within the last three or four years, was a country little heard of in the Corn-trade; for more than a generation it had been, one year with another, an importing country, drawing considerable quantities of corn from Belgium, Westphalia, and the Rhenish provinces on the north-east; and on the south from the nearest Italian Ports, and occasionally appearing even in the markets of England as a buyer. How strange to find it in the year 1850 contributing *one-fourth part* of the whole of the Wheat or Flour imported into this kingdom from abroad. This has been a consummation which Protectionists had not vaticinated, and for which Free-traders were not prepared. It stands by itself, and requires a separate explanation. It has had no small part in producing the longest-continued depression in the price of Corn in England that has been experienced during this century. It has filled with dismay our oldest Corn-dealers in the Baltic, has made the merchants of Dantsic, Stettin and Hamburg anathematise 'Free trade' as vigorously as our own farmers, and submit reluctantly to ship Corn to England at lower prices for a longer period than they had ever done before. It has turned the whole trade topsy-turvy, has puzzled its oldest oracles, destroyed all prospective judgment, and with it all speculation, and added a most provokingly unexpected reality to the forebodings even of the mournfullest prophets. The ghostly figure has arisen that the witch invoked but never expected to appear in such faithful and formidable reality, much less in that particular quarter. It has been one of the most curious episodes which the history of the Corn-trade has ever afforded.

The Revolution in France, in February, 1848, and the expiration of the Corn-laws in England in the same month of the following year, 1849, (both events probably connected with the general scarcity of the year 1847,) have produced consequences upon the Corn-market of Europe, and perhaps of the whole world, the entire features of which have not yet been seen, nor the tale fully told out. It is some years before the *reimbursement*, so to speak, of even a single year of severe scarcity is paid off, in the compensatory balance of natural season; but it is longer still before affrighted Industry is reseated at her manifold task throughout the length and breadth of a country that has been shaken in every joint, and the ramifying and interdependent relations of Trade dislocated by such a course of events as have existed in France for the last three years. Three abundant harvests alighting upon a country in which political circumstances had broken down the market for consumption even of its average produce, and drifting its superabundance into the neighbouring ports of this kingdom newly opened to the world, have placed the agriculture, both of France and England, under a cycle of trial and suffering, such as it may be hoped can scarcely, in the nature of things, occur again. On our side the channel there are no more Corn-laws to abolish; on the other the bitter experience of Revolution has been pretty well drained to the dregs; and if it have not, yet successive years of abundant harvests won't pipe for ever to their dancing.

It has been a peculiar time, of peculiar trial. That it carries, like a long rainy-season or a protracted drought, some ulterior good purpose within itself, may be not the less true, because we are not able at once to see it. Shape their measures as politicians may, or let 'accidents' or coincidences fall out or fall in, as they list, a Higher Hand is at work all the time, and broader and deeper purposes are being accomplished than we are able to read with the mere cotemporary eye. The quick sensitive-

ness of political feeling adds to the confusion and the difficulty; for it operates like a passion, distorting or exaggerating things which, contemplated with a calmer eye, would gradually resolve themselves into more intelligible attitudes of cause and effect, and become clear, at least, to those who had no object to serve in keeping the dust flying, and no aim but to arrive at practical truth.

How long the present depressed state of trade in France may go on, or how soon its cycle of abundant harvests may come to an end, it is impossible to say; but one thing is evident, that her close proximity to our shores, and her hand-to-mouth system, arising both from the total want of corn speculators in that country, and the small-scale farming which is carried on, render her a neighbour whose influence upon our corn market will become more and more important, and whose character in that regard it is very desirable to understand. A country in which the subdivision of the soil is such that the number of its landowners verges upon *six millions*; while in this they scarcely amount to two hundred thousand,—a country in which the principles of commerce are so little understood, that to this day a corn merchant is looked upon as a public enemy, and liable to popular outrage—a country nearer to us than Ireland, and containing six-and-thirty millions of inhabitants, of whom a much larger proportion are engaged in agriculture than in this, and are, both for this cause and many others, liable to much greater fluctuations of cereal produce, and, consequently, of price, than ourselves—must exercise an influence upon our markets, under an open trade, which throws upon us a double reason—as it is difficult to speculate very far-sightedly upon her resources—for ascertaining something about our own.

Never was this necessity more impressive than in the present season. Our harvest weather, and our harvest itself, have been such as to produce all the temporary appearance and effects of a glut. Needy sellers are, as usual, rushing to market, and rushing back again with pale faces, scared at the prices they have themselves produced. They come home bleating out the dismal figures at which corn was offered, as if there was a harvest every month in the year, and the country growing more than it could consume.

But the corn trade has everything yet to learn; the enormous consumption of this country, augmented by a severe winter, may make matters look very different a month or two the other side of Christmas. The late harvests of the north have yet to be reported, and the effects of another diseased Potato-crop yet to be experienced, more severely on the Continent, it appears, than even here. A 'deficient Rye-Crop' is a phrase of portentous meaning, upon that vast area of central Europe which English talkers, but no other, call 'Germany;' and which English dreamers, who dream at home, picture as a *Wheat*-growing soil like their own.

Black-Sea cargoes, freighted for England, have already been turned off, while afloat, for Hamburg, and the Dutch and Belgian Ports. It is pleasant to see how independent our own good harvest has made us, before September is well out, and the winter months began. But the sickle is a tool that requires twelve months' rest, whilst the nether-jaws of our well-employed millions have a way of wagging daily through the year with unabated zeal. The September sellers of new-grown Wheat are scarcely the best appointers of a market-price, or the trustworthiest interpreters or exponents of the future. There may be yet a further lesson for those two-tooth prophets who, forgetful, or never having heard, of the experience of the last century, have set it down impregnably for certain, that 'Free-trade' and the 'curse of over-plenty' are convertible terms. *C. W. H.*

---

Among the articles sent to the Crystal Palace, too late to be brought under the notice of the jurors, was a set of samples of agricultural produce, to which we would draw the attention of our readers. It must have been obvious to all country visitors that the Agriculture of Great Britain is scarcely represented in this great industrial meeting, except by implements. Messrs. Lawson's admirable exhibition of Scotch produce is a curious and instructive museum; of Messrs. Gibbs' wooden bowls, the less said the better; and there's an end, with the exception of some fine samples from his Royal Highness Prince Albert, and a few other exhibitors, and some most curious hybrid productions from Mr. Maund and Mr. Raynbird. We are therefore justified in repeating that our own field crops are hardly represented.

Messrs. Wrench have, however, in part supplied the deficiency, by placing on the tables some very beautiful samples of the kinds of Corn, Pulse, &c., which are most important to English growers. As a representation of British wants and capabilities, this leaves little to be desired, the samples showing what can be done by first-class growers with the materials now at their command. If, for instance, a visitor would desire to know what is the best April spring Wheat that England can furnish, he will see it in the sample furnished by Mr. Rowland, of Coulsdon; in like manner the Golden Drop Wheat from Mr. John Killick, of Cranley; the Chidham from Mr. Henry Currie; the Red Kent Oats, the Fullard's Tick Beans from Mr. Fullard, of Thorney Fen, demonstrate, each for itself, what the peculiarities are of every separate kind.

There can be no doubt that this collection, if produced in time, would have met with the most favourable consideration of the jury. As it is, we can only record the names of the articles, of which the following is, we believe, a correct list.

1. Winter Russian Beans, grown in Surrey.
2. Fullard's Tick Bean, grown by Mr. Fullard, Thorney Fen.
3. Dun, or clay Peas, by J. Lewin, jun., Hollesley, Suffolk.
4. Early Haysell grey Peas, grown by the same.
5. Old English Beans.
6. Early Mazagan Beans, grown in Kent.
7. Large grey field Peas.
8. Maple, or Partridge Peas.
9. Sandy Oats, by A. Murray, Esq., Kirkton Boundrie.
10. Potato Oats, grown by Alex. Murray, Hap, Banff.
11. Early Birley Oats, by Jas. Longmore, Esq., Hilton, Banff.
12. Black Tartarian Oats, from Perth.
13. Red Kent Oats, by T. Knight, Esq. Bobbing, Sittingbourne.
14. Poland Oats, from Lincolnshire.
15. Hopetown Oats, by A. Longmore, Esq., Rettie, Banff.
16. Winter Oats.
17. Chevalier Barley, by Wynn Ellis, Esq., St. Ann's Farm.
18. Naked Barley, by Sam. Newcome, Esq, Orsett, Essex.
19. Black Barley, from Surrey.
20. Rye, grown in Kent.
21. Old Kent Wheat, red Burwell, grown by M. Stigwood, Esq., Exning, near Burwell, Cambridge.
22. Wellington white Wheat, by Mr. Fullard, Thorney Fen.
23. Talavera Wheat, by Mr. S. Mitchell, Raynham, Essex.
24. Hoary rough-chaffed, or velvet Wheat, grown by Mr. Goodwin, Coalwood Farm, Herne, Kent.
25. Breton Wheat, grown in Berks.
26. Chiddam Wheat, by H. Currie, Esq., M.P., near Horsley-park.
27. Taunton Dean Wheat, by Mr. D. Knapping, Shoebury.
28. Hunter's Wheat, by Mr. E. Campion, Barking side.
29. April Spring Wheat, by H. Rowland, Esq., Coulsdon.
30. Clover's Wheat, by T. Gardener, Esq., Moulton, Cambridgeshire.
31. White Chaff Red Wheat, grown by Mr. W. Challen, Wisboro' Green, near Horsham.
32. Red Lammas Wheat.
33. Golden Drop Wheat, grown by Mr. John Killick, Cranley.
34. Spalding Wheat, by Mr. Thomas Nicholas, Mountnessing.
35. Rape.—36. Canary grown in Isle of Sheppy.—37. Flax grown in Yorkshire.—38. Trifolium incarnatum.—39. Trefoil.
40. Red Clover.—41. White Clover.—42. Large grey Field Peas.—43. Maple or Partridge Peas.

## THE POTATO CROP.

Whatever the case may be in other places, here certainly the disease in the tuber has progressed with a rapidity and to an extent much exceeding that of the last three or four years; and from a fact I shall presently state, I fear there is some reason to apprehend, after they shall be stored, as great a destruction to the tubers as in the first year of the disease, if they do not, as in the second year, become very generally diseased before they are dug. It is true I have only an isolated fact to state; but the mention of it will draw attention, and may lead to examinations, which, if they corroborate my observation, will give us very serious cause of alarm for the Potatoes that on the digging appear sound. At all events it is one of those curious facts which "Falcon" so judiciously calls for, in page 566 of the *Gardeners' Chronicle*, of this year's volume.

We, who here see the crop perishing before our eyes, find it very difficult to credit the favourable accounts given in other places; and, indeed, are disposed to give them very limited credence. The provincial accounts are most conflicting, but they have always been very much so, which very possibly, and in the end it has generally so proved, arise more from other causes than really from the facts being various. Many take upon them to write from the appearance of the Potatoes at market, from which, as they would injure the sale, the diseased ones have been picked out; and as the people have now a great many more swine than in the earlier years, they find a more beneficial use for them than they did in those years, and when they were consequently glad to sell them at any price in the markets; others give their opinion from having confined their observations to certain sorts of Potatoes and certain descriptions of soils; and this, from the limited location which falls under the observation of each, must necessarily very often occur; and others, again, colour their reports with the temperaments of their authorities. The only facts to be relied on are those founded on the narrow limits of ocular observation, and the still narrower of actual possession. There can be no dispute that in some soils and localities the crop is far safer than in others, so far as the tuber is concerned, or the plague spots on the stems, or in the latter retaining more or less verdure; yet neither the same soils nor the same sorts of Potatoes that have escaped in one year are to be trusted to in another with unlimited confidence; for in the second year of the disease the bog or peat soils were comparatively safe, in the third year these soils did not so generally escape. In after years they were more commonly free, but this year the first instance I heard of some extensive disease was in the neighbouring bog land, and I am told this is not very uncommon in other localities. So in the Potatoes themselves, some kinds are much more seriously affected than others; thus in Donegal a very delicious and universally planted Potato called Cuffs (not Cups) and Downs suffered so much in the first years as to be all but totally destroyed, and were thrown out of culture; while the Rattlers, a despised and ill-flavoured Potato, if ever so slightly exposed to the air after being stored, were so little susceptible of disease as to have become the common crop of the country. In Longford the Cup, a fine hardy Potato, has suffered so severely in the last two or three years that it has nearly gone out of cultivation, and last year and this has been very much superseded by a kind hitherto not known here, called Scotch Downs, the seed being obtained from Connaught, in which province it appears to have obtained some little time previous, and which as yet has been so very little affected with disease; indeed, this was so much the case, that while the Cup seed sold in our markets last spring for 4*d.* a stone, the Scotch Downs fetched from 7*d.* to 9*d.* Indeed common report said (the first time I heard of them) that last year the Scotch Downs had escaped the disease, while many suffered severely by having grown Cups. I was disposed to regard rather too lightly this report, as, from the Cup being a late Potato, I considered the loss to have arisen from their immature state at the period when the disease came on. I am now perfectly satisfied that their loss is to be attributed to their present greater susceptibility; for not only is it everywhere said that the Cups are suffering to an extent equal to the worst years of the disease, but I have positive proof in my own. In the same field, manured in the same way, and in a continuous cropping, I have half an acre of Scotch Downs and half an acre of Cups; the withering of the leaves commenced at the same time, about five weeks back, but the stems of the Scotch Downs are still green and free from spots; they are also a full crop, while those of the Cups are completely mildewed. Of the tubers of the former very few, if any, are diseased, while of those of the Cups not one-half are sound; this I have repeatedly ascertained, by separation of the sound and unsound, as they were daily dug for use; at the same time there is not of sound and unsound more than half a crop of Cups in the ground. I learn this is very generally the case, and that the Lumper is also very severely diseased. Of my Ash-leaved Kidneys about one-third are diseased.

The very general withering of the leaves may with some plausibility be attributed to the absence of terrestrial electricity, or to the greater or less activity of any universal principle which in its excessive or diminished action, may affect the vital principle, which prevents or delays chemical decompositions; but how Dr. Turley (p. 566 *Gardeners' Chronicle*) can reconcile the various and apparently contradictory phenomena, local and particular, that attend the disease, to the unity of action and of effect which so universal a pervading fluid as electricity—the *anima mundi*—must produce, unless he also give it that property which we usually ascribe to pure spiritual essence, of electing by the will, I know not.

In my ignorance, I cannot understand an absence of terrestrial electricity, material or unmaterial; it is so subtle and all pervading a fluid, so necessarily present, as an agent of all life, &c., that its absence must prove fatal, not only to the Potato, but to everything earthly. In my younger days I was taught that it might lie dormant, as in the galvanic battery, but its absence I cannot comprehend, while our telegraphic lines convey our notices, and the magnetic needle guides the mariner. We must indeed advance very far in German mysticism ere we abandon the material deductions which led Bacon and Newton on to truth, for more sublime modes of inquiry into the disease of the Potato or the causes of mortality.

Hardy and Sons, I see, again recommend "cutting off the shaws or tops as soon as they are infected, with the view of saving the tubers." This has been done with doubtful effect by many; and although they may think, and ought to think rightly, that "Every year's experience convinces us of the utility of this practice," yet I think it questionable. When it was first proposed I expressed an opinion that it was too late to cut off the tops when the disease became visible in them, as the circulation of the sap must, before the fungus showed itself in the stalks, have carried the infection through the whole plant and into the tuber; unless, indeed, the external appearance preceded the disease, and which I thought very unlikely, since, in the very first year of the disease, the tops showed none, or very little indication of the disease, it was not observed, and almost the whole crop perished from it after being stored. A fact which has just now occurred confirms very much this opinion, and leads me to dread that we shall suffer to a very great extent this year when we come to store them. The end of last December I planted, for an early crop, about a rood of ground with rough Kemps. I had dug out about half of them before there was any appearance of disease; when the leaves began to exhibit some of the usual withering, I continued to dig for daily use, and had dug the whole with scarcely any indication of disease in the stems, and with only three diseased tubers. In levelling a part of the ground, on the 10th instant, several tubers were found (three or four pounds) of which more than half were badly diseased; these were on a part of the ground which was not dug out till after the leaves had begun to wither. In the part of the ground which had been previously dug out, before there was indication of infection, the tubers found were perfectly sound. I have more of this rood of ground to level, and will give the future result hereafter. *J. M. Goodiff, Granard, Sept.* 16.

P.S. In my paper of the 29th August I stated that the amount of this year's poor-rate in the electoral division of Scrably, was 17*s.* in the pound, and in Mullahoran 9*s.*; at a subsequent meeting of guardians this rate has been revised and very much reduced.

## AGRICULTURE IN SOUTH AUSTRALIA.

In answer to your inquiries respecting the farming operations of South Australia, though I have made inquiries wherever I could, I seem to have learnt nothing worth writing about. From the extreme dryness of last winter, the crops are failures in almost all cases. Wheat has risen to 6*s.* 1*d.* per bushel. The bakers have raised the price of bread from 3*d.* to 4*d.* the 2 lb. loaf, and they say it will be higher still. The average price of Wheat here is 3*s.* 6*d.* per bushel. Hay is now 5*l.* per ton, though half that is the usual price. Meat is now 4*d.* per lb., instead of 3*d.*, for the best joints. I do not at all wonder at the latter article rising, if there are many such tracts of land as we passed over from Adelaide to here—the wonder is how animals are kept alive. You see wretched brutes snuffing with their noses in the dusty ground, and appearing to look in vain for a blade of Grass; but further in the country, and amongst the hills, I am told there is more food than could have been expected from the dryness of the season. My husband told me last night about the daily increasing number of bullocks which were dying from sheer want. The rainy season is anxiously looked forward to, but many think that the fresh Grass will at first kill both sheep and oxen. You see there will be none of the old left to counteract the effect of the new. The last time I went to Adelaide in the car, a farmer's wife gave me an account of their farming. She had been several years in Adelaide, but two of her children died, and they resolved to try a country life. She took a section about three miles from Gawler Town, which had a Pine hut upon it; bought half-a-dozen cows, a dray and four bullocks, and hoped to do well. She said she had built grand castles in the air about her cows, how she would bring butter and milk into Gawler Town. She intended to keep the family with cows and poultry, and all that the farm made was to be saved.

The husband, by working early and late, prepared a dozen acres of land, and sowed it with Wheat. Thirty bushels per acre are considered a good Australian crop on fresh land, but if they had got 20 bushels they would have been satisfied; but in consequence of the drought, the north winds had such an effect on the crop that they did not reap 30 bushels from the whole of the land; and from the cows she had for four months past she had got just sufficient milk from the half dozen to put in her tea night and morning. She said both bullocks and cows must have died from want of water if they had not got it by sinking a well in the bed of the river. I asked her how they had managed to live, and she said her husband had worked with his bullocks and dray whenever he could get employment, and she had been able to rear some poultry. The farmer's wife was just the sort of woman to come here—a strong, hard-working woman, and by no means nervous. A few days before I saw her she told me she was sitting at the door of her hut with her baby, when she heard a rustling close to her, and looking she espied a snake gliding amongst the withered Grass; she dropped the child, and with a wood chopper ran after the reptile, and managed to cut it into five pieces. She said she was terribly frightened at the time, but she knew if it was not killed she dared not stay in the place afterwards. When her son came home he put the pieces together, and found the serpent measured nearly 6 feet.

I was much amused at the opinion of one gentleman who came to Australia determined to be either a sheep or corn farmer. After he had made an inspection of the country in the neighbourhood of Adelaide, he said "Each sheep would require to be mounted on the back of a pony to be conveyed from one blade of Grass to another." The driver of the car told me that the reason there were so many thousands of acres unoccupied between here and Adelaide, was from the exposure of the plains to the hot north winds, which scorch everything up. There is as yet no system of cropping adopted, except taking as many crops of Wheat off the land as it will produce, and then it is fallowed. The first crop after the fallow is generally hay, consisting of Grass and Oats mixed (for the Oats do not ripen here), and then begin again with Wheat. Potatoes are not much grown. We are mostly supplied from New Zealand; the price at present is 6*l.* to 7*l.* per ton. I had just got this far when in came Mrs. K——, the farmer's wife above-mentioned; she could talk of nothing else but the cattle dying. One of her best cows died yesterday, literally of starvation; and a neighbour has lost 14 head of cattle from the same cause. Her husband has been at the Burra mine, and he said that within a stone's throw of one of the water-holes, he counted 100 dead bullocks! Is it not horrible? Every one is looking anxiously for rain, but the weather only seems too settled. To-night there was a most gorgeous sunset; you cannot conceive anything half so beautiful—I wish I could describe it. Fancy all along the western horizon the sky of an exquisite pale green—not blue; then above that, and stretching their arms over towards the eastern horizon, were light fleecy clouds, like branches of trees, of a reddish orange colour, and behind and between these clouds was the deepest blue;—but a description only spoils such a scene. Even the children were delighted, and I could only induce them to come into the house, by promising to hold their hands to enable them to write a letter to England.

The Government price of land is 20*s.* per acre; but as poor people cannot afford to pay, capitalists think it a safe investment to purchase outright, letting the land, on condition of purchase, at 30*s.* per acre in five years; and by this means they will sometimes get 15 per cent. on the outlay. Others again let the land for three years, and for a remuneration get it fenced. Mr. Agges, the Independent minister, has just been in; he has been out on a begging expedition for an Independent chapel, and he spoke with great admiration of the Mount Barker District, the agricultural country of South Australia: it lies about 30 to 40 miles from here. One farmer, with whom he stayed all night, told him that this year he had taken his tenth successive crop of Wheat off the same land, without even putting in a shovelful of manure, and he had got this year above 30 bushels per acre. Another told him that three years ago he bought a section which had been some time in cultivation, for which he had to pay 400*l.*, the payments stretching over three years. From the profits of the Wheat, he has been enabled to pay all off. I fancy these are unusually fortunate cases.

Badly as we have done, I never for one moment wish we had taken a farm, as I think there is as much risk in that as in any other thing. Certainly we hear often about Germans in particular, who, after working and living like slaves for three or four years, have been enabled to become possessors of a section of land; but in most cases father and sons have been able to do all the work, and they have been accustomed to hard work and privations from their cradles.

Just imagine what distress the death of all these bullocks must have caused. Probably many of them belonged to small farmers, who, to make up for failing crops, worked upon the roads, and between the Burra and Adelaide for hire; and what will they do when their bullocks are gone? The price of a working bullock runs from 3*l.* to 5*l.*

My husband was down at the Post-office last night, where he met the emigrant whose wife assisted me with the children during a portion of the voyage. They had made some money at first, but had since been unfortunate; but notwithstanding this, the good woman had actually adopted a poor orphan girl.

I am afraid my letter will be of little service to you, though I hope it will interest you as a practical farmer. I will write to you from time to time, whenever I can gather as much as will fill a letter. *Gawler Town, South Australia, 25th March*, 1851.

## THE CULTURE OF THE TURNIP.

The Turnip plant is most usually inclined to grow on light loams and sandy lands: but the growth of it has been gradually extended to soils of a heavier sort, that have been rendered more friable by the processes of cultivation. The use of it in the fields began in Norfolk, where the soils are favourable, and where the ploughing of land with two horses, yoked abreast, was observed by Mr. Dawson, the son of a Scotch border farmer, who went there for the purpose of acquiring general knowledge. He had seen Jethro Tull's book, in which was propounded the theory of sowing all crops in rows or drills, and he hence conceived the idea of forming drills or ridgelets by the common plough. Mr. Dawson's first attempt near Kelso was unsuccessful on a harsh clay land. But having soon afterwards removed to a very favourable soil of sharp gravelly loam, on the north slope of the Cheviot hills, his success was unbounded, and Turnip farming in the hands of the border farmers, on the very favourable soils of that country, soon raised the cultivation of the plant to the present just pre-eminence which it has there attained. The general field culture of the Turnip may be dated about the year 1760.

Turnips form the second crop in the most approved rotations on light lands, and thrive best after Oats, which are most generally the first crop after Grass, which begins the course. From whatever cause it may arise, the fact is certain, that Turnips thrive better after a crop of Oats than after any other plant, either culmiferous or leguminous. So soon as the harvest is completed, the Oat stubble is ploughed to the depth of 6 to 8 inches, so soon as the early winter rains will have moistened the soil. In this state the land lies till March, or till the dry weather allows it to be cross-ploughed, when the harrows and roll, used alternately, crush the clods and raise the weeds, which are picked by hand, and removed from the field. A similar process of ploughing and harrowing is done in about 14 days after the first operation, when the weeds and stones are again removed. Four clear earths are, at an average, reckoned sufficient to clean lands, and to bring them into a proper state of pulverisation. Lands intended to be sown with Swedish Turnips in May should have received two clear earths by the first of that month, and must get another about a week before the sowing commences; the lands to be sown with common Turnips in June should get two or three earths by the beginning of that month. The ploughing before the drilling of the land should be done across the field, as the drill plough is always inclined to slide into, and follow the longitudinal furrow, and lose the proper direction. By crossing the last done ploughing, it has no inducement to any lateral direction.

The dung from the farm-yard must have been laid in oblong heaps on the headland or near the gateway, and turned over, in order to commence the fermentation about 10 days before the use of the dung is intended. Upon this fermentation being produced at the proper time, and upon its going on briskly at the moment when the dung is deposited in the drills, and the seed placed within the reach of the exhalations and combinations that are happening during the fermentative process, and the recent movement of the soil, the success of the Turnip crop very much depends while in its embryo state of existence. The drills are laid in a direction which will be at an angle with the ploughing of the land for the succeeding grain crop, though in many cases both processes are done in the same direction. On deep light loams the drills are made by a double mould-board plough, which makes a ridgelet by travelling the length of the field, forming two drills in going and returning. This plough is of somewhat difficult management, owing to the double-feathered share gliding upon and not penetrating the bottom of the land, and the two wings or mould-boards resisting a downward tendency, and heaving the plough upwards. The common plough is used in forming drills by going twice in one furrow; and though double time is consumed, the mode is much the most preferable. In the quicker operations of modern times, drills are formed by one furrow of the common plough, and the dung is covered by two; which, however, implies that the soil is a good Turnip loam. In the majority of cases, the common plough is preferable to the double mould-board, especially where the surface of the ground is formed of some number of crumbling clay clods, and when the bottom is clayey, gravelly, or a hard concreted earth. The double mould-board plough is unable to penetrate the stiff bottom, and the wings push together the clods of the surface, which form the top of the drill, and afford to the Turnip seed a bed of dry clods, without moisture or loamy adhesion. The common plough, with the angular pointed share, penetrates the ground, and throws to the surface a fresh moisture raised from beneath, in which the Turnip seed vegetates, and grows rapidly. This superiority is now most decisively established.

Farms of 400 acres and upwards admit the largest arrangement—of two ploughs, forming drills with one furrow, at the average rate of eight acres daily; five or six one-horse carts will bring forward and deposit the dung, three or four men are engaged in filling the dung at the heap, four boys drive the carts to and from the field and the heap, one lad leads the cart, being emptied, along the three drills that receive the dung, a very steady man pulls the dung from the carts into regular heaps of a small size, a man separates the heaps into three parts into the three drills, three women or stout lads provided with light three-pronged forks, spread the dung evenly along the furrow; a very careful man follows the spreaders, places any neglect in the proper place, calls and corrects the spreaders, and sees the work properly done. Three common ploughs follow closely after the spreaders, and cover the dung with two furrows to each drill, and finish one ridgelet in going and returning. The ploughs are provided with main trees of five feet in length, which stretch over two drills, and enables the left hand horse to walk on the top of the drill on the near side, which prevents the feet of the animal from removing or pushing about the dung lying in the hollow, if the horse walked in the interval. In returning, the horses walk in two hollows, with one between, in which the plough moves and throws the earth over the right hand drill, which was covered from the left side by the first cleaving of the ridgelet. The double Turnip drill sower follows closely the covering ploughs, and deposits the seed on the freshly moved soil. Eight acres can be finished in a day by this arrangement.

If the season of Turnip sowing be dry, and the land cloddy, rolling of the drills is very necessary on the day after being sown. In damp weather, and on moist soils, the light roll attached to the sower may be sufficient, or the rut of the coulter may be left entire, as the sides of it protect the young plants which grow in the hollow. But in the case of cloddy soils and a dry season, the quick rolling of the drills is most essential; it breaks the clods, presses the seeds close to the dung, and in imbibing and retaining moisture it acts as a lock and key. Without that operation the seeds lie among dry clods or parched dust, and in many cases never vegetate at all from the want of moisture, and of that degree of pressure which is necessary to attach the tender germination to the soil or future bed.

The most indispensable and essential requisite in sowing Turnips is dispatch or quickness of execution in getting the different processes performed, so as to keep in store for the use of the young plant the moisture that may be in the soil, and to prevent it from escaping. The time of the year is the driest in the whole cycle—the sun is generally hot and parching, and rains are unfrequent, and fall at distant intervals. In such cases—and they are very general, the moisture in the land forms the only dependence, and in order to retain it for the uses of the young plant, a very considerable exertion becomes necessary. After the beginning, the drills must be opened only half an hour before they are closed again, in order to prevent the exposure of the land to drought; the dung-carts must be close upon the drilling ploughs; the covering ploughs working within three drills of the dung being spread, and the seed sowing machine finishes the process of depositing the seed upon every two drills immediately as the ploughs leave them. The multitudinous number of farming implements yet wants a roll for the purpose of pressing the bottom, sides, and top of the drills, and present a very beautiful finish of sowing Turnips on the finer kind of loams. A log of wood must be hollowed into the shape of the drill, and secured by iron hoops at the ends and thick parts. Cast iron has been attempted, but the bottom and sides are not properly pressed. During the want of such an implement, the drills are rolled by a cast-iron cylinder of 6 cwt.

Turnips must be sown thickly, not under 3 to 4 lbs.

an acre, according to the humidity or dryness of the season. When the tender plants stand singly and distant, they grow slowly, and are more exposed to the attacks of enemies. When growing thick together, the plants shoot up much more rapidly, get sooner beyond harm's reach, and attain the fit state for being hoed or singled out. In ordinary seasons, the Turnip plants will have attained a good size in the course of six weeks from the time of being sown, and will show an abundance of large rough leaves. The horse hoes, drawn by one horse, must be first employed to cut the bottoms and sides of the intervals between the drills, and the hoers can enter on the work immediately. Each worker is provided with a hoe made of thin iron, about 9 inches long and 4 inches wide, on the middle of which an eye is attached on the upper edge, into which is fitted a rounded wooden shaft of such a length as allows the wielder of it to stand upright when the hoe rests upon the ground. A steady person is appointed to lead, or go foremost, and the others follow in close succession. Each person stands with a foot on either side of a drill, and hoes or thins the one immediately before him, and the drill which he bestrides is hoed by the person immediately behind. The operation is performed by "drawing and pushing;" the hoe is pulled through the the row of growing plants, and leaves one plant, at the distance of 9 inches, or the length of the blade of the hoe; it is next pushed through the row, and leaves another growing plant as before. The drill is thus formed into a narrow comb with the growing plants attached to the top by a single thread of root, lying on their side, from which position they quickly rise and stand upright. The earth, weeds, and superfluous plants are thrust into the interval of the drills, where the action of the scuffler, two or three times repeated during the summer, kills every vegetation, and pulverises the soil. A second hoeing after the Turnips are grown in the half size, pulls any weeds that have escaped the horse hoe, and any Turnip plants that form two together, from the neglect of the first hoeing. The horse hoes continue the scuffling of the intervals so long as the leaves of the plants, in meeting over the intervals, allow the passage of the implement. Earthing up the drills of Turnips by the double mould-board plough is not now practised, as the contact of earth encourages the shooting of lateral fibres, which render the bulb very bitter and coarse. The crop is left to grow till required in October or November.

The growing of Turnips by artificial manures requires the lands to be prepared as above explained, by the soil being finely pulverised, and the weeds and stones removed. The drills are best formed by a deep heavy furrow of the common plough, at the distance of 27 inches, on which Hornsby's drop drill deposits the manure and seed in mixture, in bulbs, at the distance of 9 inches, which are let go from a cylinder with valves that are opened by a spring. This method saves both manure and seed that are wasted in a continuous stream, and the vegetation of the seed is stimulated and very much assisted by being mixed with the manure, and thus having the food in the readiest preparation, as in the case of bones, which are now heated, fermented, reduced by acids, or prepared by steaming. The intervals of the drills are scuffled, and the plants thinned to one in the distance of 9 inches, as before explained.

The raising of Turnips on the flat ground is practised with much success on the royal farms at Windsor, which are under the management of Major-General Wemyss, a gentleman of a very acute and enlightened mind. The soils are harsh loams, lying on the junction of the clunch clay with the Bagshot sand, and intermixed with the chalk. The finer loams are ploughed with the dung into ridges of 14 feet in width, on which the Turnip seed is sown by the corn drill, and the crop managed as before directed. On the more clayey lands, which are hardly Turnip soils, the land is gathered with the dung into stitches of 6 or 8 feet in width, which are harrowed fine on the surface, and the seed is sown in rows by a machine with lengthened coulters, which covers the narrow ridge by one operation. The crop is managed as before explained. The land is kept dry in winter by the frequency of furrows, which may lose ground for the crop, but renders more safe the ridges that bear it.

As a corollary from this solution of the problem of growing Turnips on harsh clayey loams, it may be supposed that the practice can be extended to clay lands that are thought to be beyond the reach of being used in any way for the growth of Turnips. The land may be reduced as much as possible till the time of sowing—the land ridged with the dung into breadths of 6 to 10 feet—the surface harrowed as fine as possible by horses walking in the furrows and drawing the harrows, which cover the ridge, and which are attached to a tree which stretches over it. The seed is then sown in rows by coulters, and the crop managed in the usual way. It may be doubted if Turnips could be grown in this mode on the clays of marine formation, but the alluvial deposit of that earth will admit a much more extended cultivation.

The only objection to sowing Turnips on the flat ground arises from there being no hollow interval in which the scuffler can move for the purpose of killing the weeds, and pulverising the ground. There is the usual width of interval, but being on a level with the plants, there is wanting the same freedom as is afforded by the hollows of the drill system. But this deficiency is very amply compensated by the advantages that have been mentioned.

Turnips are yet in some places grown broadcast, and on good clean lands very fair crops are produced. But the system is most miserably deficient on weedy lands, and in moist climates.

On pared and burned lands, Turnips are sown in broadcast, as the land being only once ploughed, does not admit the drill by the plough or lengthened coulter. The finely harrowed surface over the ashes receives the seeds, and good crops are obtained. In the case of loamy lands, the ground is wrought and fallowed, and drilled by the common plough. The ashes are thus well mixed with the soil, and produce large crops of roots. Ashes have been spread on pared land where the burning was not done, and little benefit was derived from the application, which shows that the chief benefit arises from the temperature that is given to the land by the heat of the fires, and which remains in the land a longer or shorter time, as the land is constitutionally formed for imbibing and retaining caloric. Hence the very great differences that have been observed from the process of paring and burning.

Turnips are required for use in the end of the month of October, and almost universally by the 1st of November. The fibres and tops are cut by hand-sickle from the bulbs on the ground; the tops are given to young cattle in the yards, or to store sheep on a lea or stubble ground. The bulbs are carried to the homestead, and given to feeding and store cattle, in an entire state, or cut into slices, and placed in cribs, which are best made of wood, having latticed bottoms.

The lambs of the year will require the first use of the Turnip crop, and the most forward growth of the White Globe variety. The whole crop may be consumed by the sheep, or the one-half, one-third, or any part, may be carried away, and the remainder used on the ground.

The most useful varieties of the Turnip are, the White Globe, the Green Globe, and the Aberdeen Yellow. The Swedish Turnip, or Ruta-baga, is the most useful of all, as it resists the hardest frosts without injury. It requires the best lands and heavy manuring, and to be early sown—from the 10th to the end of May. The White Globe is used for consumption from October to January; the Green Globe from January to March, when the Swedes and Yellows come into use, and extend to June, when properly stored.

The chief disease or enemy to which the Turnip is exposed is the fly (the Altica nemorum of entomology), a little insect belonging to the order Coleoptera; they are bred from larvæ deposited in the fields, and there are five or six broods in the summer; they love sunshine, and eat most voraciously the first smooth leaves or cotyledons of the Turnip. No remedy has yet been found against this most destructive insect. The only plausible one consists in having the land and manure in a prime state of preparation, so as to push the young plant into the rough or second leaf, when it is beyond the power of its enemy.

The introduction and the successfully extended cultivation of the Turnip very soon most completely revolutionised the entire circle of British husbandry, by increasing both the quantity and quality of animal and vegetable food, and by insuring a steadier supply of the necessaries of life at all seasons of the year. *J. D.*

## Home Correspondence.

*Drainage.*—After all that has been written on draining, it seems not a little singular to meet with such views as those expressed by Mr. Gill, in the *Gazette* of to-day (Sept. 27). Referring to stiff clay, he says, "If water will sink through 1 foot, why not through 5 feet? for gravity extends deeper." The question would be sensible enough, if the subsoil were equally tenacious above and below, and gravity the only influence required to make it porous and friable; but evaporation or drought is the chief agent in effecting porosity, and all authorities admit that it must operate effectually on clay, before water can sink properly into the drains. Hence the question arises, how deep will its power extend, and what will its effect be at the sides of each drain? This is, in fact, what the whole argument, when divested of verbiage, resolves itself into; yet Mr. Gill, and others, see fit to avoid this point, although the only one now requiring consideration, and the principal one by which the proper depth and distance of drains in clay must be determined. Do they suppose that stiff clay is as porous below as at the surface, or if it were that evaporation would act on it to an unlimited, or even to a considerable depth? If they do, I will only say they have studied and experimented to little purpose, and must be incompetent to judge as to the merits of an argument on this question. The argument, it should be observed again, refers merely to stiff clay soils, for as regards porous soils, all good drainers give in their adherence, not indeed to any particular depth, but to depths of from 3 to 20 feet or more, as the case may require. The point at issue, thus limited, can be understood, and I have been expecting to see Mr. Wilkins grapple more closely with it, so as to bring it to a satisfactory termination, which he must know cannot be done by mere general assertions and truisms. His remarks, as yet, are far from proving to my mind the propriety of draining five feet deep, in tenacious soils. It is very true, as he says, that an acquaintance with caloric, hydraulics, hydrostatics, and geology, is necessary to show why and how land should be drained, and he might have added at least two other conditions, viz., an idea of the depth and distance to which a drain will enable drought to operate; and a sound judgment to bring all these branches of knowledge to bear in the best manner upon any given case, whatever its nature may be. If he had done this, and then shown how he applies the whole to guide his practice, we might have seen how far he is warranted in recommending universal deep drainage, or the treatment of all cases alike. Science, in the abstract, is very good; but what we require is science applied in all its bearings on this case, to found a theory which practice will sanction—one about which there can be neither doubt nor cavil. When this is done the result may perhaps not be as Mr. Wilkins anticipates, for it is quite clear that he and others are not looking at this question in all its bearings, and until they do so I think it quite possible that they may reason falsely and practise imperfectly or uselessly in cases differing from those to which their experience has extended. There is one particular twaddle about water sinking as deep as drought will operate. Most people know that with proper management all the rain will and ought to sink at once through at least 18 inches of any soil, but there are soils respecting which an opinion is entertained, that no management will cause the water to sink much deeper than 18 inches between the drains; and let me assure Mr. Wilkins and those who think with him, that this opinion rests on a basis which all their philosophy will not overturn. It is true the results of experience are not complete, but they are quite sufficient at any rate to show that stiff clay beyond a very limited depth will not be changed from an impervious mass to a fine open filter, merely because a man chooses to cut drains in it at conventional distances, even although the drains be filled with porous matter. Mr. Gill appeals to practice, and says, "Let a 5 foot drain be cut in clay and observe its effect." Very well, let it be cut by all means, and if the subsoil should happen to be a really stiff clay, tilly or indurated in any way, or containing iron or stones to bind it together, or prevent its being readily contracted, the result will be as I have observed many times, that the drain, after reaching the depth of 3 feet, merely affects a few inches of the clay at each side, and procures no additional shrinkage of the mass above, neither extending its width nor increasing its depth, so as to enable water to sink deeper into it. This will be the result of the trial in every instance where the subsoil is a stiff clay, and Mr. Gill will excuse my hinting that he himself might learn a lesson from it with advantage before he again recommends it to others as if it were new. This brings me to say a few words on bottom water, respecting which curious ideas are entertained. These ideas are set forth in the most complete manner in the Quarterly Reviewer's pamphlet, where we have two diagrams, representing the subsoil below the level of the drains as a semifluid mass, or, at least, containing much water. Now, I would ask, is this a common case? Is it the rule, or the exception, or either of them, in well-drained land? Did any drainer ever meet with a case in which, after cutting to the proper depth, he was under the necessity of laying his tiles on a body of water? Doubtless, there are cases where water is retained and fills the subsoil to a considerable depth, but then it is usual to cut to the bottom of the water, if not to carry it off more perfectly at that place, at least to prevent its bursting out somewhere else. Let drainers banish all such ideas from their minds, and endeavour to look at the case as it is; for if a man is not correct in his views and principles, what assurance is there that his practice will be right? I would almost as soon trust a man who works by rule of thumb and can give no reason at all for his operations, as one who founds a system on false philosophy and obstinately insists on applying it under all circumstances however dissimilar. The one has no proper idea either of the object to be attained, or the best means of attaining it. He merely imitates what he has seen, and produces a work more or less deteriorated from the original. The other, it is true, has an idea that a certain effect is to be realised under certain circumstances, and he argues rightly enough as to what the effect should if possible be, but shows great ignorance of the circumstances; consequently the plan he lays down is not more certain or trustworthy than in the other case. *James Donald.*

*Potatoes and Beer.*—Will "J. D.," who has furnished us with a few good articles, give us his experience on Potato culture. Mr. Cuthill, in his teaching, gives us two opposite practices in preparing sets. In his pamphlet, as I understand it, he advises the Ash-leaf Kidney to be planted entire, with its cluster of eyes; but by the process of Messrs. Fitch, which he encloses in his papers on "Market Gardening," we are taught to exterminate all the eyes but one. What I desire to know is, whether, for the early Potato, it is better to have a multiplicity of shoots or stems, or only a single one, resulting from one eye? "Cerevicus," who writes on brewing, perhaps can tell me, whether, in carrying on brewing in hot weather, it would do to take only half of the extract of double strength, and after boiling it, to mix with it cold water? or by adding ice, in order to reduce the heat for fermentation thus:—Suppose I desire to obtain 12 gallons per bushel, I take but 6, and add 6 of cold water to the extract. *A. B.*

*Chicory.*—As the duty upon roasted Chicory is so much higher than upon kiln dried, care is, of course, taken by the foreign growers or preparers that the kiln-drying process is never carried on so far as to char or colour the root so much as to raise a question as to whether it was roasted or merely kiln dried. In preparing home-grown Chicory for the market, the object should be to get it as nearly as practicable into the state and appearance of the foreign kiln dried. There may be trouble in effecting this at first. Experiments on a small scale are easily effected before a kitchen-fire with a Dutch

oven, or something of the kind; and the loss on desiccation is easily ascertainable. The loss on desiccation depends very much on the method that is used; for example, in the common way of roasting coffee, there is a loss of 3 lbs. in 14 lbs. raw. By the improved machinery, the loss is only 9 lbs. in 112 lbs.—

As 14 : 3 :: 100 : 21.4
As 112 : 9 :: 100 : 8.

P.S. Since the preceding notes were written, the whole of the crop of Chicory has been dug out. The season was so dry and unpropitious after sowing, that fears were entertained of the seeds not growing; there has been, nevertheless, a very fair crop. Several roots brought in weighed 15 oz. each. In agricultural products the possible and the probable are to be considered and weighed. Roots in 3 drills to the yard and 5 roots in each drill, might attain 1 lb. each, that is 15 lbs. to the square yard. And calling desiccation 5 raw to 1 kiln dried—which is a full allowance—there would be 3 lbs. of kiln dried from the square yard, and—

| sq. yds. | lbs. | | lbs. | | cwt. | qrs. | lbs. |
|---|---|---|---|---|---|---|---|
| 4840 | × 3 | = | 14,520 | ÷ 112 = | 129 | 2 | 16; |

which, at 30*s.* per cwt., will come to 194*l.* 9*s.* 3*d.*, a possible produce from 1 acre. My gardener is of opinion that the finest roots are produced in strong stiff ground—that is in the comparatively stiff ground which we have here—very different, however, from the stiff clays of England; and as the larger, heavier roots go very deep into the ground, of course it must be important to have the ground well prepared. The leaves from the crop just taken up were in fine full vigour to the last, and very abundant. *W., Ravenswell.*

*Manufacture of Manure.* — In this busy time of harvest, in our late northern climate, and at our high elevation, I have not till now had time to advert to a discussion which took place recently at the Yorkshire Agricultural Society, on the management and application of home-made manure—H. S. Thompson, Esq., being the principal speaker. It is certainly to be regretted that Mr. Thompson publicly reiterates his objections to roofed receptacles for the preservation of farm-yard manure from the vicissitudes of the weather; alternately drenched by heavy falls of rain and snow, and the scorching heats of the noon-day sun. It is true that Mr. Thompson advocates its cartage into the fields, and to be there coated over with soil, until required for use; but we may ask, What protection for preserving its essence from the pernicious effects of the weather had it experienced before being so carted out? and even when deposited in heaps in the fields, how often has Mr. Thompson seen the operation of coating with soil effectually executed? has he not, on the contrary, more frequently observed what is, or rather ought to be, the farmer's main-stay for producing remunerating crops, recklessly permitted to

"Waste its fragrance on the desert air?"

as mentioned above, its ammonia and other fertilising properties evaporated in turns by the heat of the sun, and neutralised by pelting rains, the precious liquid finding its way to the next running stream or stagnant uncovered pond; and if carted out, in this almost worthless state, as recommended by Mr. Thompson, how can the fertilising qualities be restored to it, by undergoing the tedious and expensive operation of coating over with soil, even allowing that this is properly done? This would, indeed, be locking the stable door after the steed is stolen. It is, however, difficult to imagine what Mr. Thompson exactly means by expressing himself so decidedly opposed to protecting manure by a roof, when he in the same discussion strongly advocates the propriety of roofing over the whole farm-yard. In this discussion, Mr. Thompson, in addition to what he asserted on former occasions on the same subject, is reported to have said, "No man can be more alive than I am to the great loss arising from manure being wasted by rain; but I am, nevertheless, opposed to covered manure pits, under ordinary circumstances, because I am persuaded that great solidity is indispensable to the preservation of manure;" and a little below he adds, "In very moist climates, such as hilly districts of the west of England, where two or three times as much rain falls as with us, it becomes a choice of difficulties, and the only way of escaping them appears to me by having fold-yards entirely roofed over. I feel persuaded that those who live 10 years longer will see buildings of this kind more numerous than is now thought profitable." Here is a palpable blowing hot and cold in the same breath. Mr. Thompson recommends the non-roofing of manure heaps, and the next moment advocates the propriety of adopting the opposite plan. In admitting that rain, or too much of it, is prejudicial to manure, does it not occur to Mr. Thompson that exposure to the rays of the sun is injurious? In my opinion they are more so than rain. In the one case, the redundant liquid can be arrested by the tank; but where does the valuable exhalations caused by the sun go? Mr. Thompson speaks favourably of the system of box-feeding, as a means of producing excellent manure; in which opinion I must cordially join him. What is that which is called a box but a roofed receptacle, so far as manure is concerned, which Mr. Thompson himself admits is so conducive to the formation of good manure. True, Mr. Thompson attributes this excellence to the treading of the cattle confined in them; and this to a certain extent may be correct; but when he adds "that great solidity is indispensable for the preservation of manure, and that a manure heap must be trodden as much as possible," I must beg leave to demur, though no chemist, to this doctrine, particularly when the manure is but in an incipient state. That a certain state of consolidation is necessary, cannot be denied; but that the absolute exclusion of any air, from the several appliances which go to the formation of a perfect manure heap, I should be rather inclined to think an agricultural chemist would object to, as detrimental to their decomposition, so essentially deemed necessary, both by theorists and practical men. Mr. Thompson is, doubtless, a great authority, and as he appears desirous of imparting his agricultural knowledge to the cultivators of the soil, it is the more to be deplored, if he be a medium in leading them to wrong conclusions, and addressing them in language which, in the present low scale of education pervading our farmers, ninety-nine out of a hundred of them do not understand. If Mr. Thompson, in place of learnedly speaking to them of the merits of hydrated sesquicarbonate of ammonia, and such other technical phrases, advised them, in plain homely English, to endeavour to persuade their landlords to erect roofs over their manure heaps and stack-yards, and also to sink tanks for the preservation of the liquid manure, to be pumped as occasion required over the general mass, and to erect other necessary appurtenances now much wanted, for the proper management of a farm, the farmer paying even 10 per cent. on the outlay, and the landlords keeping them in repair, he would, it is submitted, be doing a much more essential service, not only to both landlords and tenants, but to the nation at large. If these suggestions were fully carried out in all their details, farming might then be found more remunerating than it is, during the low prices of the present time; and cultivators, whether chemists or not, would find out that hydrated sesqui-carbonate of ammonia, and other chemical combinations, generated by manure so prepared, would unconsciously, whilst they slept—poor innocent souls!—be doing duty to their crops, and that their corn-stacks were secured from the destructive ravages of weather and vermin. I can myself most truly assert, that from a strict adherence to the processes I so strongly urge on the attention of the farming community, I have been enabled, for a series of years, to produce such crops from an ungenial and proverbially sterile soil, situate, some of it, at a no less elevation from the sea than 700 feet, and none of it less than 600 feet, as have much surprised all those best acquainted with the locality. I repeat, I am far from thinking that a certain consolidation is not necessary for the retention of the fertilising substances in farm-yard manure; but I would wish to be understood in saying, that the daily wheeling of it on the roofed heap, from the stables, cow-houses, piggeries, not boxed, together with the sundry ingredients, such as the scouring of ditches, clippings and dressings of hedges, saw-dust, &c., and regularly stratified on its surface, as it accumulates, will in practice be found sufficient compression, admitting just so much air as is necessary to encourage decomposition, but no more. Salt has also been applied for a long time to the manure heaps at Gilgarran, and the contents of the liquid manure tanks regularly pumped over them; these tanks being in existence long before their use was publicly advocated by the press. Mr. Thompson, in recommending covered farm-yards, shrewdly predicts, "that those who live ten years longer will see buildings of this kind more numerous than is now thought profitable." Should Mr. Thompson ever honour this part of the country with a visit, I could show him such a building which has existed nearly since he was ten years younger; and I could also show him covered sheds in grazing fields, affording shelter to outlying cattle in summer from flies and the heat of the sun, in winter from the inclemency of the weather, which, being regularly littered, afford abundance of rich trodden manure, and which would otherwise in a great measure be lost. In conclusion, I beg to take the liberty of recommending Mr. Thompson to call the attention of his agricultural friends to the general adoption of such sheds. *Jas. Robertson Walker, Gilgarran, Cumberland, Sept.* 27.

## Societies.

HIGHLAND AND AGRICULTURAL, *July* 9: *The Chemical Department.*—Mr. MACONOCHIE said:

I am sure that every gentleman that has been in the direction—every gentleman that has had occasion to employ a practical chemist—every gentleman that has witnessed the extreme diligence and activity with which Dr. Anderson has performed the duties entrusted to him, must be satisfied that, perhaps among the whole list of practical chemists in this country, the directors and the Society could not have selected a gentleman more completely fitted for his situation. I am quite sure of this, that there is not a person that has availed himself of the opportunity that has been afforded him for having analyses of the soils of his lands, and of the manures which he employs in their cultivation, that has not been completely satisfied. That these have been of infinite importance to himself in a pecuniary point of view, I speak on that subject with very inadequate means of information, so far as my own experience is concerned. I still, however, have had some experience on the subject, and from that experience, as well as from my general knowledge, I am quite sure that if the farmers of the country, and the landed proprietors, would avail themselves of the opportunity which has been thus afforded them, and at so cheap a rate, of obtaining analyses of their soils, and their various uses, they would secure a hundred times more money in their pockets than what they expend in procuring such analyses. But it does not appear that the proprietary of Scotland are yet thoroughly aware of this, because, from a list in my hand, I can state that the total number of subscribers throughout Scotland to the chemical department of the Society is only 217. I am not exactly right in this statement, for I perceive that 37 of them are not even proprietors; so that of the whole landowners of Scotland there are only 180 who subscribe to this most important branch of the Society's operations. That is the condition of matters throughout the length and breadth of Scotland, as regards the landed proprietors. I believe it is a fact, that many of the gentlemen who are in the habit of practising agriculture are, to a great extent, as ignorant of the nature of the soil they cultivate, and of the manures which they use in that cultivation, as if they had lived 300 years ago, instead of in the middle of the 19th century. That, in short, is the state of the chemical department, in so far as it has hitherto, in a great measure, been supported. The whole amount subscribed amounts to a sum much less than that which the Society has guaranteed to Dr. Anderson; and the question is, whether, in such a state of matters, we are to go on expending this sum out of the funds of the Society—a large sum as regards the finances of the Society, but a sum which I take leave to say is far from adequate to pay the salary of Dr. Anderson as he ought to be paid. I would therefore urge on the proprietary of Scotland who do not subscribe to this department, the great importance of doing so. The directors, after the fullest consideration of the matter, have come to the following resolution, which I have now to propose to the meeting:—"That it is necessary to adopt measures for obtaining increased and more adequate means in support of the Society's Chemical Department, and that, for this purpose, an application should be addressed by the treasurer and honorary secretary to those landed proprietors who have not yet subscribed."—Dr. ANDERSON said he had, at the general meeting of the Society in January, reported so fully as to the state of the laboratory, that perhaps a short report would serve the purpose at present. Since January the laboratory had gone on in the ordinary way; and nothing new or of great importance had occurred to report to the Society. During that period of time the ordinary amount of analyses on general subjects had been made. They had also been engaged with certain investigations, at the instance of the Society, and some of these had advanced to a very considerable extent. One of them—that of the investigation of Turnips—had been partially published in the Society's Transactions; and a larger portion would have been published in the July number had there been space for that purpose; but, of course, what was not inserted would be reserved for another number. He had also published in the Transactions of the Society, several other short investigations; and he might mention that the committee had under consideration an additional series of investigations, namely, in reference to the hay crop under different circumstances, and also in reference to the Clover crop. The analytical part of these investigations had not yet been commenced, although the preliminary steps in connection with them had been taken of growing crops in the proper quantities, and with the proper manures. Another investigation in progress, had reference to the feeding value of different kinds of food for cattle. This investigation was advanced to some extent, but he had not as yet published any part of it, as he considered it preferable to wait until a sufficient number of analysis had been accumulated, to make each determination the average of several, by doing which the table of feeding values would obtain a much greater value, than if it were founded only on single analysis of the different sorts of food.

## Reviews.

*Blaine's Canine Pathology.* Fifth Edition.

THE author of the work before us has been justly regarded as the father of canine medicine. Educated, in the first instance, as a surgeon, and a sportsman from taste and opportunity, he was peculiarly fitted for the study of the diseases of the canine race, and thus he was enabled, after a while, to add the treatment of the diseases of dogs to his general practice as a veterinary surgeon. It may, perhaps, be thought that a man of science and education, like Mr. Blaine, somewhat reduced his *status* by thus directing his attention to the pathological study of an inferior race of animals. We wholly dissent from such an opinion; for, independent of the striking analogy which exists between many of the diseases of the dog and those of the human subject, there was one malady more particularly, viz., "Hydrophobia, or Rabies," the investigation of which was demanded by the interests of humanity, and if no other effects had attended the labours of Delabere Blaine and his partner and successor, William Youatt, that the light they had succeeded in throwing on this dreadful malady, the description of the early symptoms by which it may be known, and the best means for obviating its justly dreaded horrors, these results would have entitled their exertions to the utmost consideration. It was in the earlier editions of the work before us that the correct views of the author on this horrid malady were made public, and which succeeded not only in saving from a dreadful death very many individuals who might have been bitten by a rabid dog, but in saving them likewise from those ordeals which it was the custom to go hrough, under the idea of preventing the supervention of the disease. It was formerly the custom for parties to come long distances to the seaside, and there to undergo the practice of dipping, which indeed was carried to the extent almost of drowning the unfortunate individual. It was in great measure owing to Blaine and Youatt that these vulgar errors were exploded; and to them, and the former more particularly, not only the veterinary but the medical profession and the public at large are greatly indebted for having thrown the mantle of science around the previously neglected study of canine pathology, and rescued it from the clutches of ignorance and prejudice. The respected author of the work has been gathered to his fathers, but his works will long survive him; and now that a new edition of the one before us is demanded, Mr. Thomas Walton Mayer has undertaken the task, and well has he acquitted himself of it. The editor is very favourably known to the veterinary profession and the public, in connection with his late respected father; and he modestly states in his Preface: "In discharging the duty that has devolved upon us in revising this edition, we have been desirous of contributing our mite to the well-being of the canine race, regretting that our literary and professional experience has not enabled us to do greater justice to our subject. We have not, however, been so much desirous of adding new, and possibly, but at best crude ideas of our own, as we have been to give effect to the work of Mr. Blaine, by re-arranging his matter, compressing his facts, with the addition of such improved classification and methods of treatment, as the advanced state of veterinary science has enabled us to supply." The plan here suggested has been very well carried out, and we cordially recommend the work to all interested in the subject.

## Miscellaneous.

*Quantity of Milk a Cow should give in a year.*—In your Paper of August 1st I notice a letter from the clerk to the Carrick-on-Suir Board of Guardians, in which he assumes that 23 cows will yield 140,160 quarts of milk in the year, or over 6000 quarts for each cow. Experienced farmers have informed me, that about 2000 quarts are fair produce from a cow. I have the care of a dairy farm, on which the cows are fed principally on green crops; the average ground for each cow was 1½ acre, and I annex a statement of the milk from each cow in one year.

MILK IN ONE YEAR,

Measured in the cow-house, from the cows; as the weeks closed on Saturday night, some months contain five weeks' account.

* This storm came from the south-west, and from a warmer latitude; its approach, therefore, produced a warmer afternoon, but having passed over this island to the eastward, the body of the storm being in a colder latitude, the back current caused frost.

As the season is approaching in which frosts occasionally occur, it will be interesting to observe to what extent they coincide with a *rising* barometer; *should this coincidence be found generally to hold good, it may be taken as a confirmation of the theory of rotatory and progressive storms.*

† This storm came from the westward, and passed away to the eastward; but it lay a long way to the northward, or must have been but of small extent.

‡ A storm coming also from the westward, and passing away to the eastward, over the south of England. The central storm's-eye was passing over London about 4 P.M. of the 30th.

Dorchester [Oct. 2]. *F. P. B. M.*

(*To be continued.*)

## Calendar of Operations.

SEPTEMBER.

Dorset Farm, *Sept.* 29.—We have now got the harvest all in, and throughout we have had the weather as favourable as we could have wished; and if we may judge from the appearance of the crops, we must set them down as greatly above an average. But as prices have fallen so much, there is little inducement to bring them to the proper test (the threshing-machine). But whatever the quantity may be, there is no room for doubting that the quality is good. And in looking back on the past five months (to farmers the most important), we must put them down as the best that any one here remembers having seen. The only drawback is the Turnip crop, which is not so good as last year; and under ordinary circumstances, we cannot expect to come up to an average crop. But as there is abundance of good hay, we are not altogether unprepared to weather a storm. We have not yet been able to do much in the way of ploughing for Wheat, as the land is so dry and hard. The general work now is taking up Potatoes, and although they are all a little diseased, yet there are a great many good; and on the whole, they are better than they have been for some years. Grass is beginning to get short, but the price of stock does not fall much, even with little prospect of a heavy Turnip crop Lean pigs have lately fallen in price, which is no doubt owing to the price of Barley keeping up. For with all the Barley good, and selling from 26*s.* to 28*s.*, there is no inducement to buy lean pigs to fat on good Barley, and then fetch only 7*s.* 6*d.* or 8*s.* per score. And we may expect that fat pork will rise a little in price. We have just finished eating the last year's crop of Mangold, on which all our store pigs have fed entirely, and they kept good up to the last. And as the season for taking up the new crop is now approaching, we would urge upon all not to allow the tops to be cut off when they are taken up, but have them twisted off; as we are convinced that the wounds inflicted on them in cutting off the tops are one chief cause of their rotting when stored in heaps. *G. S.*

## Notices to Correspondents.

Peas: *A Ainslie.* Many thanks for your note about our correspondents, by which we shall profit hereafter.—We know of no new winter Pea. Any seedsman here, in the south of England, will provide you with a perfectly safe winter Pea.

Poultry: *E C Hall.* There is no difficulty in breeding between the Muscovy drake and Aylesbury ducks. The produce is a large and rather awkward bird; it requires to be killed younger than other ducks, on account of the strong flavour natural to the drake, which is unpleasant to most palates, if the bird is full grown.—*J J.* Where there is no local market for surplus stock, the best method of disposing of it is to send it to a respectable salesman in Leadenhall market. The difference between buying and selling is always great, and appears greater than it is in reality. A dealer will always buy that of which he stands in need; but in buying live birds he has to calculate the cost of keep, the uncertainty of sale, and the chances of death. Mr. Sorigens, of Leadenhall market, is a very respectable and good salesman *J. Baily*, 113 *Mount street.—R H.* Some of the perfectly true Sebright bantam cocks may be procured, say six or seven, by applying to Mr. Wisbey, Boreham, near Chelmsford, Essex. They are the gold, tipped with black on the feathers.—The Sebright Bantam: *W P.* We cannot tell you the *exact* weight that the thorough bred hens ought to be. We have one, *very* small (thorough bred), and her weight is just ¾ of a lb. We have had her in our possession several years, but can procure none others like her. *W. K.—J O L.* You have been deceived in the strain. If the cock you have purchased has the "flying feather," he is *not* what you represent him to be. *W. K. – S W.* Yes; these birds, if bred "in and in," are very hardy. Ours winter as well as, if not better than, any of the so-called "hardy fowl." We very rarely have a death in the family. *W. K.*

Sea-sand: *D E.* You may store Carrots in dry sea-sand—or without any sand at all. We pile them in heaps, just as we do our Beets and Turnips, and they keep perfectly. We should pit Potatoes in small quantities in a dry place; a dry floor, if secured from frost, is perfect of its kind. But the more laborious methods of Mr. Cuthill will produce a stronger plant.

## Markets.

COVENT GARDEN, Oct. 4.

Peaches are nearly over. Pines and Grapes are abundant. A few West Indian Pines still make their appearance. Damsons are scarce, as are also Oranges and Lemons. Nuts remain nearly the same as quoted last week. Carrots, Turnips, Cabbages, &c., are sufficient for the demand. Potatoes are generally good in quality. Lettuces and other salading are sufficient for the demand. Mushrooms (bushels) appear but slowly. Cut flowers consist of Heaths, Pelargoniums, Mignonette, Heliotropes, Stephanotis, Bignonia venusta, and Provins Roses.

FRUIT.

Duty 115,000*l.*

SMITHFIELD, Monday, Sept. 29.

We have a large supply of Beasts, notwithstanding a considerable number of foreign cattle expected for this market have not arrived in time. However, the choicest descriptions are not plentiful, and we are therefore enabled to quote 3*s.* 6*d.* for them. The number of Sheep is much smaller; the demand is not extensive, this being Michaelmas week; the trade on the average is rather better. Calves are not so numerous, and good qualities are rather dearer. From Holland and Germany there are 1800 Beasts, 4210 Sheep, and 188 Calves; from Scotland, 30 Beasts; and 2750 from the northern and midland counties.

| Per st. of 8 lbs.— | s | d | s | d | Per st. of 8 lbs.— | s | d | s | d |
|---|---|---|---|---|---|---|---|---|---|
| Best Scots, Hereford, &c. ... | 3 | 4 | to 3 | 6 | Best Long-wools . | 3 | 6 | to 3 | 8 |
| Best Short-horns | 3 | 0 | — 3 | 4 | Ditto Shorn ... | | ... | | |
| 2d quality Beasts | 2 | 0 | — 2 | 8 | Ewes & 2d quality | 3 | 0 | — 3 | 4 |
| Best Downs and Half-breds ... | 3 | 10 | — 4 | 0 | Ditto Shorn ... | | ... | | |
| Ditto Shorn ... ... | | | | | Lambs ... ... | 3 | 8 | — 4 | 4 |
| | | | | | Calves ... ... | 2 | 6 | — 3 | 8 |
| | | | | | Pigs ... ... | 3 | 4 | — 3 | 0 |

Beasts, 5148; Sheep and Lambs, 27,320; Calves, 249; Pigs, 300.

Friday, Oct. 3.

The number of Beasts is again large; but it chiefly consists of foreign and inferior quality, and including a large number left over from Monday last. There being only few fresh good Beasts on offer, these are readily sold at a slight reduction. Our top quotation is exceeded in a few instances. Purchasers are scarce for inferior kinds, although there is a disposition to sell at reduced rates. The supply of Sheep is small; there is no quotable advance in price. Trade on the average is better for Calves. From Germany and Holland we have 623 Beasts, 2290 Sheep, and 227 Calves; from Spain, 100 Sheep; from Leicester and Northampton, 300 Beasts; and 113 milch cows from the home counties.

| Best Scots, Hereford, &c. ... | 3 | 2 | to 3 | 4 | Best Long-wools . | 3 | 6 | — 3 | 8 |
|---|---|---|---|---|---|---|---|---|---|
| Best Short-horns | 3 | 0 | — 3 | 2 | Ditto Shorn ... | | ... | | |
| 2d quality Beasts | 2 | 0 | — 2 | 6 | Ewes & 2d quality | 3 | 0 | — 3 | 4 |
| Best Downs and Half-breds ... | 3 | 10 | — 4 | 0 | Ditto Shorn ... | | ... | | |
| Ditto Shorn ... ... | | | | | Lambs ... ... | 0 | 0 | — 0 | 0 |
| | | | | | Calves ... ... | 2 | 8 | — 3 | 10 |
| | | | | | Pigs ... ... | 3 | 4 | — 4 | 0 |

Beasts, 1222; Sheep and Lambs, 6790; Calves, 395; Pigs, 460.

MARK LANE.

Monday, Sept. 29.—The supply of Wheat from Essex to this morning's market was small, from Kent fair, with but little offering from the eastern counties: the whole was sold early on the terms of this day se'nnight. Foreign is held firmly, there being a little more inquiry, but sales are still limited, at former prices. Polish Odessa afloat is in good demand at 29*s.* to 30*s.* per qr. cost, freight, and insurance.—Picked samples of English Barley sell at last week's prices; secondary sorts are neglected, and fully 2*s.* per qr. cheaper. Foreign must also be written 1*s.* per qr. lower.—White Peas are 1*s.* per qr. more money; other descriptions unaltered in value.—Beans are 1*s.* to 2*s.* per qr. cheaper.—Oats are a slow sale, and new English declined 6*d.* to 1*s* per. qr.—In Flour, no alteration.

Friday, Oct. 3.—There has been an increase in the arrival of French Flour this week; of Wheat, English or foreign, the supply is good, but moderate of other articles. This morning's market was badly attended, and we observe no alteration in the value of English Wheat. Foreign met with some inquiry, but holders were firm, and there was little done.—In the value of Barley, Beans, and Peas there is no alteration.—Oats are a slow sale, and new rather cheaper.—Flour meets a good inquiry at full prices.

Arrivals this Week.

Liverpool, Tuesday, Sept. 30.—The arrivals into this port for the week ending yesterday contain a fair quantity of Oats and Oatmeal, with a few small parcels of Wheat and other produce from Ireland and coastwise. At our Corn Exchange this morning we experienced but a moderate demand for good English and foreign old Wheats, and a limited sale only for other descriptions; holders, nevertheless, refused to accept lower terms, and the quotations of this day week stand unvaried. Of farmers' new Wheat, samples were numerous, and the quality and condition being excellent, attracted the attention of millers in preference to the old. Barley, Beans, and Peas were taken slowly at late rates, except Egyptian Beans, which declined 6*d.* per qr. In Malt, no variation. Oats and Oatmeal were a trifle cheaper. Indian Corn on the spot supported former rates. —— Friday, Sept. 26.—We had a tolerable number of home and country millers at our market this morning, and the demand for old Wheats, both English and foreign, was upon a moderate scale. We have a moderate demand for new Wheats at nearly last week's prices. Barley, Malt, Beans, and Peas were without alteration in value. Oats were in slow request at a decline of 1*d.* per 45 lbs., and Oatmeal receded further again to-day 6*d.* per qr. Cargoes of Indian Corn afloat still command attention; on the spot little business was done to-day, but full prices were paid.

GLASS.

THOMAS MILLINGTON'S FOREIGN SHEET GLASS is far superior to any other manufacture, as well as cheaper. In 100 feet boxes packed for immediate delivery.

| | | | | | |

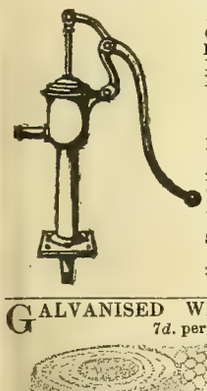
Milk Pans, 2s. to 6s. each; Metal Hand-frames, Glass Tiles and Slates; Cucumber, Propagating, and Bee Glasses; Wasp Traps, Glass Shades, and Plate Glass, at 87, Bishopsgate-street Without, same side as Eastern Counties Railway.—Established 100 years.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

J. WEEKS AND Co., King's-road, Chelsea, HORTICULTURAL, ARCHITECTS, ENGINEERS, and BUILDERS. These Boilers are very powerful, durable, and economical. The fire warranted to last 15 hours without attention. The Furnace Bars are Hollow Tubes, through which the return water passes before entering the upper part of the Boiler, thereby causing a very rapid circulation, and producing double the effect from the same quantity of fuel.

J. WEEKS and Co., King's-road, Chelsea, CHALLENGE the whole world to make a Boiler that will produce anything like the same effect, with the same quantity of Fuel, in a given time. It is one of these Boilers that warms the water of their VICTORIA REGIA Tank, which contains 9000 gallons, and also heats several large Forcing-houses and ranges of Pits, with a small consumption of fuel.



Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

GREEN AND HOTHOUSE BUILDER.—Green and Hothouses made by Machinery, sent to all parts of the United Kingdom. These Horticultural Buildings are warranted to be made of the best materials, and the cheapest in England. Lists of prices post free. 1½ in. greenhouse lights, 2¾d.; 1¾ in. ditto, 3d.; 2 in. ditto, 3¼d. per foot; if glazed with 16 oz. sheet-glass of a large size, 4d. per foot extra. J. LEWIS, Horticultural Works, Stamford-hill, Middlesex.

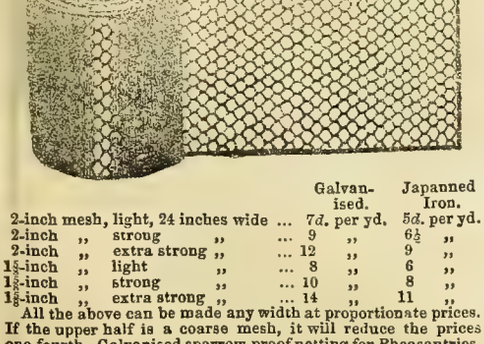
GREENHOUSE.—Must be cleared in a few days, a Greenhouse nearly new, with hot water apparatus—to be sold for half-price, with an excellent assortment of Flowers, Camellias, Azaleas, Cactus, Geraniums, &c.; may be seen by applying to Mr. PELLING, Hornsey-road, or Mr. LANG, 7, Haymarket, London. The Greenhouse is of first-class make, and heated with BURBIDGE and HEALEY'S hot water apparatus, with Vines of the very best sorts in full bearing; a flower stage and a quantity of slate shelving.

WARMING AND VENTILATING FOR CHURCHES. CONSERVATORIES, AND OTHER BUILDINGS.—The most efficient and economical Hot-water Apparatus, supplied and erected for the above purposes, fitted with improved boilers, requiring no brick-work, capable of working 14 hours without attention. Also the THERMANTERION, a cheaper and simpler apparatus, especially adapted for buildings only used occasionally.—Apply to SPILLER and TAYLER, Battersea, near London.

FARM AND COTTAGE PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

| | |
|---|---|
| Patent Pump ... | ... £1 16 0 |
| Patent Pump, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing ... | ... ... 2 12 0 |



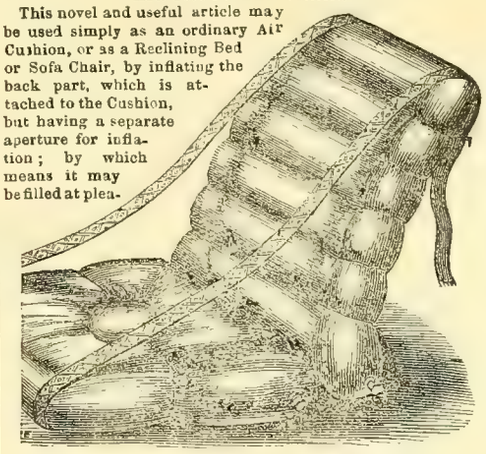
Larger sizes if required.

May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers.

JOHN WARNER & SONS, 8, Crescent, Jewin-street, London.

Every description of Machinery for Raising Water, Fire Engines, &c. The usual allowance to the Trade.

GALVANISED WIRE GAME NETTING.—7d. per yard, 2 feet wide.



| | | Galvanised. | Japanned Iron. |
|---|---|---|---|
| 2-inch mesh, light, 24 inches wide | ... | 7d. per yd. | 5d. per yd. |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised sparrow-proof netting for Pheasantries, 3d. per square foot. Patterns forwarded post free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

THE GREAT EXHIBITION, HYDE PARK.
North-west Gallery—Class 28, No 83.

J. L. HANCOCK'S INFLATED INDIA-RUBBER AIR-PROOF BED-CHAIR.

This novel and useful article may be used simply as an ordinary Air Cushion, or as a Reclining Bed or Sofa Chair, by inflating the back part, which is attached to the Cushion, but having a separate aperture for inflation; by which means it may be filled at pleasure to any degree of tightness, and set to any angle. Invalids will find this article admirably adapted for great ease and comfort, either on a bed or sofa.

VULCANISED INDIA RUBBER HOSE PIPES for Breweries, Fire-Engines, Watering Gardens, and Flexible Gas Tubing of various kinds.

Portable India-Rubber Shower and Sponging Baths, Waterproof Fishing Boots, Air Cushions and Beds, made any size to order.

All orders addressed to JAMES LYNE HANCOCK, India-Rubber Manufactory, Goswell-road, London, will meet with immediate attention.

GEOLOGICAL MINERALOGY.—KING'S COLLEGE, London.—Professor TENNANT, F.G.S., will commence a COURSE of LECTURES on MINERALOGY, with a view to facilitate the study of Geology and of the application of mineral substances in the Arts. The Lecture will be illustrated by an extensive Collection of Specimens, and will begin on Wednesday next, October 8th, at 9 o'clock A.M. They will be continued on each succeeding Wednesday.

October 4. R. W. JELF, D.D., Principal.

THE GREAT EXHIBITION.—HINTS TO VISITORS.—Among the tens of thousands who will grace the Industrial Fair, every nation will contribute bright samples of its youth, beauty, and fashion. The frequenters of the Ball, the Public Assembly, and the Promenade, will find both personal comfort and attraction promoted by the use of ROWLAND and SONS' valuable aids; and what better mark of esteem can be offered to friends on their return home, as a memento of the Great Exhibition, than a packet of "ROWLANDS' UNIQUE DISCOVERIES."

ROWLANDS' MACASSAR OIL,
For the growth, and for preserving, improving, and beautifying the Human Hair.

ROWLANDS' KALYDOR,
For improving and beautifying the Skin and Complexion, eradicating all Cutaneous Eruptions, Sunburn, Freckles, and Discolorations, and for rendering the Skin soft, clear, and fair.

ROWLANDS' ODONTO,
Or PEARL DENTIFRICE, for preserving and beautifying the Teeth, strengthening the Gums, and for rendering the Breath sweet and pure. Price 2s. 9d. per box.

BEWARE OF SPURIOUS IMITATIONS.

The only GENUINE of each bears the name of "ROWLANDS'," preceding that of the article on the Wrapper or Label.

Sold by A. ROWLAND and SONS, 20, Hatton-garden, London; and all Chemists and Perfumers.

THE GREAT EXHIBITION.—A valuable, newly invented, very small, powerful Waistcoat-pocket Glass, the size of a Walnut, to discern minute objects at a distance of from four or five miles, which is found to be invaluable at the Exhibition, and to SPORTSMEN, GENTLEMEN, and GAMEKEEPERS. TELESCOPES.—A new and most important INVENTION in TELESCOPES, possessing such extraordinary powers, that some, 3½ inches, with an extra eye-piece, will show distinctly Jupiter's moons, Saturn's ring, and the double stars. They supersede every other kind, and are of all sizes—for the Waistcoat-pocket, Shooting, Military purposes, &c. Opera and Race-course Glasses, with wonderful powers; a minute object can be clearly seen, from 10 to 12 miles distant.—Invaluable newly-invented preserving Spectacles, invisible and all kinds of acoustic instruments for relief of extreme deafness. Messrs. S. and B. SOLOMONS, Opticians and Aurists, 39, Albemarle-street, Piccadilly, opposite the York Hotel, London.

HOUSE FURNISHING AND INTERIOR DECORATIVE ESTABLISHMENT, 451, OXFORD-STREET, LONDON.—Cabinet Furniture of every description at marked prices—Brussels Carpet, 2s. 6d. per yard.—Damask Curtains, 10d. per yard and upwards; Ditto, in Silk and Worsted (French fabric), nearly two yards wide, at 8s. per yard.—The best Floor Cloths that can be made, cut to any dimensions, 2s. 3d. per yard. The largest Manufactory in London for Paper Hangings, English and French Decorations, adapted either to the Cottage or the Mansion, fitted up, showing the side of a room finished for occupation.

"FRIGI DOMO."—A Canvas, made of prepared Hair and Wool, a perfect non-conductor of Heat and adapted to many Horticultural and Floricultural purposes for covering over frames where a fixed temperature is required. It is 2½ yards wide, and of any required length, at 1s. 4d. per yard run.—Manufactured only by E. T. ARCHER, Carpet Manufacturer, 451, New Oxford-street, London.

METCALFE AND Co.'s NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1s. An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY and Co.'s, Sole Establishment, 130 B, Oxford-street, one door from Holles-street.

METCALFE'S ALKALINE TOOTH POWDER. 2s. per box.

CAUTION.—Beware of the words "From METCALFE'S," adopted by some houses.

PRICE FOURPENCE OF ANY BOOKSELLER.

**Order the Athenæum** of any Bookseller.

THE HAIR.—LOST AND RESTORED.—"Newport, Isle of Wight, Sept. 6, 1848.

"Gentlemen,—Some three months since, finding my hair falling off by nearly handsful, and my head approaching baldness; in fact, being quite bald at the crown and on the sides, I was induced, through my hairdresser, Mr. Beach, of this place, to try your BALM OF COLUMBIA, and after persevering with four bottles, according to your directions, I found a new crop produced, which has now restored my head to its former appearance. As I had apprehended a total loss of my hair, I feel it due to the virtues of your Balm of Columbia thus publicly to bear my testimony. Mr. Beach, who recommended me, is the same who used it successfully in Mr. Wilson's case, whose testimony you have lately published. Mr. B. is a Lymington man; I am also a native of that place, though for the last ten years in practice here as a solicitor.—Yours, &c. H. RICE.

"To Messrs. C. & A Oldridge."

For the strengthening of weak hair, its restoration when thinly scattered, or falling off and consequent general improvement and embellishment, the powers of OLDRIDGE'S BALM OF COLUMBIA are known by the continually increasing numbers who are testing its merits, as powerfully and unfailingly efficient.—Price 3s. 6d., 6s., and 11s. per bottle. No other prices are genuine. Ask for OLDRIDGE'S BALM, and never be persuaded to use any other article as a substitute.

13, Wellington-street North, seven doors north of the Strand.

NEW SHOW ROOMS FOR BEDSTEADS.

HEAL AND SON have erected some extensive Warerooms for the purpose of keeping every description of Bedsteads. In Iron their stock will include every sort manufactured, from the cheap Stump, for servants' use, to the handsomely ornamented tubular-pillared Canopy, as well as Brass Bedsteads of every shape and pattern; and in wooden Bedsteads their Rooms are sufficiently extensive to allow them to fit up a variety, both in Polished Birch and Mahogany, of Fourpost, Canopy, and French, and also of Japanned Bedsteads—in fact, to keep in Stock every sort of Bedstead that is made; and they have also a general assortment of Furniture, Chintzes, Damasks, and Dimities, so as to render their Stock complete for the Furnishing of Bedsteads as well as Bedding. And without attempting to compete with the prices at which the lowest class of Furniture is sold, and which is fit for no useful purpose, their new Stock will be found to be priced on the same principle by which their Bedding trade has, during the last 30 years, been so successfully extended, and the goods, whether of a plain and simple pattern, or of a handsomer and more expensive character, are of well-seasoned materials, sound workmanship, and warranted.

HEAL and SON'S list of Bedding, containing full particulars of Weight, Sizes, and Prices of every description of Bedding, sent free by post, on application at their Factory,

196 (opposite the Chapel), Tottenham Court Road, London.

GOOD NEWS FOR THE AFFLICTED.

DR. ROBERTS'S CELEBRATED OINTMENT, called the "POOR MAN'S FRIEND," is confidently recommended to the Public as an unfailing remedy for Wounds of every description, a certain cure for Ulcerated Sore Legs, if of 20 years' standing; Cuts, Burns, Scalds, Bruises, Chilblains, Scorbutic Eruptions and Pimples in the Face, Sore and Inflamed Eyes, Sore Heads, Sore Breasts, Piles, Fistula, and Cancerous Humours, and is a specific for those afflicting Eruptions that sometimes follow Vaccination. Sold in pots, at 1s. 1½d., and 2s. 9d. Also, his PILULÆ ANTISCROPHULÆ, confirmed by more than 40 years' experience, to be without exception one of the best alterative medicines ever compounded for purifying the blood, and assisting Nature in all her operations. Hence they are useful in Scrofula, Scorbutic Complaints, Glandular Swellings, particularly those of the Neck, &c. They form a mild and superior family Aperient, that may be taken at all times without confinement or change of diet. Sold in boxes at 1s. 1½d., 2s. 9d., 4s. 6d., 11s., and 22s. each. Sold wholesale by the proprietors, BEACH AND BARNICOTT, at their Dispensary, Bridport, and by the London houses; retail by all respectable Medicine Vendors in the United Kingdom. Observe—No medicine sold under the above name can possibly be genuine, unless "Beach and Barnicott's, late Dr. Roberts, Bridport," is engraved and printed on the stamp affixed to each package.

PARR'S LIFE PILLS are acknowledged to be the best Medicine in the World. 30,000 boxes sold weekly.—The fine balsamic and invigorating powers of this Medicine are truly wonderful; a trial of a single dose will carry a conviction that they are all that is necessary to invigorate the feeble, restore the invalid to health, and to do good in all cases. The heads of families should always have them in the house, as they may, with the greatest confidence, be resorted to at any time or in any case. BILIOUS DISORDERS.—These Pills are all-powerful in removing the distressing symptoms attendant upon bilious obstructions, disordered state of the stomach and bowels, such as pains in the head, dimness of sight, sickness, oppression of the chest, lowness of spirits, disinclination for active employment, and various other symptoms at all times troublesome, and not unfrequently dangerous. By taking two or three doses of OLD PARR'S LIFE PILLS, the symptoms above described are speedily removed, an unusual degree of serenity pervades the mind, the stomach and bowels are restored to their natural functions, and returning vigour is the result. None are genuine unless the words "PARR'S LIFE PILLS" are in White Letters on a Red Ground, on the Government Stamp, pasted round each box; also the fac-simile of the signature of the Proprietors, "T. ROBERTS and Co., Crane-court, Fleet-street, London," on the Directions. Sold in boxes at 1s. 1d., 2s. 9d., and family packets at 11s. each.

FULHAM.
TO MARKET GARDENERS, FARMERS, AND OTHERS.
MESSRS. PROTHEROE AND MORRIS will sell by Auction, on the premises, Dawes-lane, Walham-green, Fulham, on MONDAY, October 6, at 12 o'clock, by order of the proprietor, in consequence of the land being wanted for other purposes, the whole of the STOCK of a MARKET GARDENER, comprising a large quantity of fine Rhubarb of best sorts, Cauliflower Seed, seven Store Pigs, five Sows and Pigs, 54 3-light Boxes and Lights, 400 Hand-glasses, a useful Black Cart-horse two capital Market Carts, Harness, Chaff-box, Corn-bins, large Water-tub, Iron Tank, Wash-butt on wheels, Wheelbarrows, 36-round Ladder, Water-cans, Baskets, Potato Punnets, and Garden Tools; also a large quantity of Manure, &c.—May be viewed prior to the sale, and Catalogues had, on the premises; of Mr. PRESTON, 2, Rupert-street, Haymarket; Mr. BORTHWICK, 547, New Oxford-street; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

HAYES, MIDDLESEX.
TO GENTLEMEN, NURSERYMEN, FLORISTS, and Others.
MESSRS. PROTHEROE AND MORRIS are directed by the Executors of the late Mr. W. Burdett to sell by Auction, on the premises the "Waggon and Horses," Hayes, Middlesex, about a mile from the Southall Station, on WEDNESDAY, October 8th, at 12 o'clock precisely, the whole of the stock of EVERGREENS, a large quantity of fine Standard ROSES, Gooseberry and Currant Trees, Herbaceous Plants, Box Edging, &c.; together with a 7-light Pit, Hand-glasses, seven Hives of Bees, Wheelbarrows, Carpenter's Bench and Tools, a capital 26-round Ladder, Tent Bedsteads, two Portmanteaus, sundry Harness, Baskets, Garden Pots, Tools, and other effects.—May be viewed, and Catalogues had, prior to the sale, on the premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

ISLINGTON NURSERY.
TO NOBLEMEN, GENTLEMEN, NURSERYMEN, BUILDERS, AND OTHERS.
MESSRS. PROTHEROE AND MORRIS are instructed, by Mr. G. Smith, to offer to public competition by Auction, on the premises, on MONDAY, October 13th, and two following days, in consequence of the Land being let for building, the whole of the valuable NURSERY STOCK, comprising several thousand scarlet white, and Hybrid Rhododendrons, Ghent and other Azaleas, variegated and green Hollies, of various sizes, in considerable quantities, several thousand Aucuba japonica, from 1 to 4 feet; a large quantity of fine Mulberries of different ages, many of which are fine bearing trees, &c. May be viewed prior to the sale.—Catalogues had on the premises, of the principal Seedsmen in London, and of the Auctioneers, American Nursery, Leytonstone, Essex.

STANHOPE NURSERY, GLOUCESTER-ROAD, OLD BROMPTON.
TO NOBLEMEN, GENTLEMEN, NURSERYMEN, BUILDERS, AND OTHERS ENGAGED IN PLANTING.
MR. J. RAWLINGS has received instructions from Mr. Wm. Siggers to submit to public competition, by Auction, on the premises, as above, on MONDAY, October 6, and following days, at 11 o'clock each day (in consequence of the Lease having expired), the whole of the valuable NURSERY STOCK, consisting of many thousands very fine Aucuba japonica, Laurel, Laurustinus, Yew, Arbor Vitæ, Holly, &c.; Fruit and Forest Trees, American Plants; Standard, Dwarf, and Pillar Roses; Irish Ivy, some very large Camellias and Scarlet Rhododendrons in pots, &c. Also a handsome Chesnut Mare, a capital light Spring Van, with top complete, and other effects.—May be viewed prior to the Sale. Catalogues had on the premises, of the principal Seedsmen in London, and of the Auctioneers, American Nursery, Leytonstone, Essex.

FREE TRADE IN BULBS AND FOREIGN PLANTS.—TO NOBLEMEN, GENTLEMEN, NURSERYMEN, FLORISTS, AND OTHERS.
MR. J. RAWLINGS has received large importations of Bulbs, Ghent Azaleas, Rhododendrons, &c. The first portion of which will be submitted to public competition by Auction, at the Mart, Bartholomew-lane, on TUESDAY 14th October, 1851, and following days, at 12 o'clock. The stock comprises the finest double and single Hyacinths, Narcissus, Tulips, Jonquils, Crocus, Snowdrops, Anemone, Ranunculas, Gladiolus, &c. Ghent Azaleas and Rhododendrons, beautifully furnished with bloom buds, and in excellent condition for potting; fine Standard, Dwarf, and Pillar Roses, consisting of all the leading varieties; and a quantity of the Scarlet Moss, fine for potting; also the new kinds of Strawberries, such as Myatt's New Early Prolific and Eleanor, Ridley's Goliah, Wilmott's Prince Arthur, &c. The lots will be arranged for the convenience of large and small purchasers. May be viewed the morning of sale, and Catalogues had at the Mart, and of the Auctioneer, 50 Hoxton-square, and Ebenezer Nursery, Shacklewell, London.

WANDSWORTH COMMON.
TO NOBLEMEN, GENTLEMEN, NURSERYMEN, BUILDERS, AND PUBLIC COMPANIES ENGAGED IN PLANTING.
MR. J. RAWLINGS will submit to public competition, by Auction, on the premises, Wandsworth Common (five minutes' walk from the Clapham station, and a quarter of an hour's walk from the Wandsworth station, on the South-Western Railway), on MONDAY, October 20, 1851, and few following days, at 11 o'clock each day (by order of Mr. Robert Neal, in consequence of the ground being immediately required for other purposes), the whole of the valuable NURSERY STOCK, consisting of a considerable quantity of very fine Evergreens, Fruit and Forest Trees; New, Ornamental, and Deciduous Shrubs, &c.; many thousands of American plants, comprising fine scarlet and other Rhododendrons, Azaleas, Kalmia, Andromeda, Magnolia, &c.; a fine collection of Pines, Standard and Dwarf Roses, and well-established plants in pots, of Clematis azurea grandiflora and flammula, Irish Ivy, Virginian Creeper, Bignonia, Choisia Camellias, Chrysanthemums, &c. Also a large new 17-light Pit, 12 000 Bricks, a quantity of useful Timber, Paving Stones, and excellent Stone for Building, 400 loads of Rich Mould, a quantity of Garden-pots, &c.—May be viewed prior to sale. Catalogues (1s each, returnable to purchasers), may be had on the premises, of the principal Seedsmen, and of the Auctioneer (post paid on application), 50, Hoxton-square, and Ebenezer Nursery, Shacklewell, London.—The whole of the Nursery Stock is in excellent condition, and having been planted within the last three years, may now be removed with the greatest safety.

PARTNERSHIP.—The Proprietors of an old established, extensive, and increasing business in the NURSERY AND SEED TRADE, in the principal town of the South of England, contemplating retirement, are desirous of taking an active partner; one acquainted with the business would be preferred, and from whom a less premium would be expected. Not less than 2000l would be required, for which an immediate return from the proceeds of the business of the forthcoming season would be guaranteed. None but persons of responsibility need apply, or will be treated with.—Apply to T. M. CATTLIN, Esq., 30, Ely-place, Holborn, London.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, AND OTHERS.
MESSRS. PROTHEROE AND MORRIS are instructed, by the proprietor, to sell by public Auction, on the premises, Chester Nursery, Kennington (near Walcot-terrace), on FRIDAY, October 17th, at 11 o'clock, the whole of the valuable GREENHOUSE PLANTS, consisting of the newest varieties of Geraniums, Fuchsias, Chrysanthemums, Roses in pots, Camellias, Genistas, Verbenas, &c.; also five newly-erected Greenhouses, 10 Pits and Boxes, together with about 600 feet of capital 4 inch bore Hot-water pipe, three excellent Boilers, Spring Cart, Garden Pots, Compost, and sundry effects.—May be viewed prior to the sale. Catalogues had (6d. each, returnable to purchasers), on the premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.
Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

WANTED, a new or second-hand Bleached DUCK MARQUEE, suitable for Floricultural Exhibitions; size, about 65 feet by 27, with Poles and Fittings all complete.—Address M. W., *Gazette* Office, York.

Complete in Three handsome Volumes, price Three Guineas,

GREAT EXHIBITION.
HUNT'S HANDBOOK COMPLETE, Price 6s. By ROBERT HUNT, Professor of Mechanical Science, Government School of Mines.
"Every care has been taken to render this compilation a record worthy of preservation, as giving within a limited space a faithful description of certainly one of the most remarkable events which has ever taken place upon this island, or in the world—the gathering together from the ends of the earth, of the products of human history, the efforts of human thought."—*Extract from Preface.*
"The most instructive guide to the Exhibition while it is open—we have no doubt that this 'Hand-Book' will become hereafter one of the most popular mementoes and histories of the actual gathering of the nations."—*Athenæum.*
"The most complete and popular Guide published. Useful in the Exhibition, and agreeable afterwards as a reminiscence of what was seen in the great year of 1851."—*Spectator.*
"Let no one imagine that because the Great Exhibition will shortly be closed, that the 'Handbook' is not therefore needed; on the contrary, it should be read and retained by all as a compact and portable record of what they have seen exhibited."—*Literary Gazette.*
SPICER BROTHERS, Wholesale Stationers.
WM. CLOWES AND SONS, Printers,
29, NEW BRIDGE STREET, BLACKFRIARS, at HYDE PARK, of all Booksellers in Town and Country, and at the Railway Stations.

Now Ready, price 15s. each.
PARTS IV. AND V. OF THE OFFICIAL DESCRIPTIVE and ILLUSTRATED CATALOGUE, containing the Colonies, Foreign States, and full Index of Names and Subjects, completing the Work.
SPICER BROTHERS, Wholesale Stationers.
WM. CLOWES and SONS, Printers.
OFFICIAL CATALOGUE OFFICE, 29, New Bridge-street, Blackfriars, at Hyde Park, and of all Booksellers.

PRACTICAL INSTRUCTIONS ON THE DRAINAGE OF LAND, on Hydraulic and Pneumatic Principles, by SIMON HUTCHINSON, Land Agent, Manthorpe-lodge, Grantham, Lincolnshire. Sixth Edition (10th thousand) illustrated. Price 1s.
To be had of Messrs. GROOMBRIDGE and SONS, London: Messrs. SUTHERLAND and KNOX Edinburgh; at the Railway Stations, of Messrs. SMITH, or Messrs. DAWSON, &c.; or by order of any Bookseller in the Kingdom.

TO ADVERTISERS.—The LEEDS TIMES is now the SECOND most largely circulated Yorkshire Journal. Announcements not inserted in its columns fail to come before a great portion of the community. A copy sent on receipt of five stamps.

Now ready, in demy 8vo., price 1s. 6d., Part V. of
BRITISH POMOLOGY: Or, the History, Description, Classification, and Synonymes of the Fruits and Fruit Trees of Great Britain.
By ROBERT HOGG.
"The four parts of the work which are now before us afford good indication that the prospectus will be ably carried out. So far, the enumeration of Synonymes, with their citations, is certainly the most complete and extensive which has hitherto been published. The works of English and foreign authors, ancient and modern, have been carefully consulted. The work, however, is not a mere compilation, for the author has evidently great practical knowledge of the various subjects. It is abundantly illustrated with well-executed outline woodcuts, and, when complete, will form an interesting, and, to gardeners, most useful volume."—*Gardeners' Chronicle, Sept.* 27.
"We can testify that the work contains fuller information relative to each variety, so far as at present published, than any other English volume. It is a most valuable addition to our garden literature."—*Cottage Gardener, Sept.* 25.
"The best, so far as Apples are concerned, that I have ever seen."—*G. W. Johnson, Esq.*
"We can cordially recommend the work to those of our readers who are interested in the cultivation of Fruits."—*Midland Florist.*
London: GROOMBRIDGE and SONS;
And to be had of all booksellers in the country.

PUNCH'S RECORDS OF THE GREAT EXHIBITION, containing FIFTY ILLUSTRATIONS, and the size of the *Times* Newspaper, is published this day, Oct. 4, price Sixpence.

| ,, Jas. Dickson, of Acre-lane. | |

Signed on behalf of the meeting, S. SANDERS, Chairman.

CAMELLIAS.—Fine healthy Plants of CAMELLIAS, well set with flower buds, may be had at CHANDLER and SON'S Nursery, Wandsworth Road, Surrey, at 30*s.* per dozen; larger size 42*s.* per doz.

The best sorts of CHRYSANTHEMUMS, bushy plants, for flowering this autumn, 12*s.* per dozen.

Post-office orders payable at Kennington Cross.

STANDARD ROSES.—An Amateur has about 500 first-rate sorts, which must be taken off the ground before Christmas. They have been selected with more than ordinary care, are all tallied with zinc and numbered, and vary from 2 to 5 feet high. They would be sold at about half their cost to any gentleman taking the whole, and less than 50 in a lot would not be disposed of.—Address, by letter, S. S. W., 33, Fleet-street, London.

SEEDLING PELARGONIUMS, &c.

NGAINES begs to announce that his Descriptive Catalogue of Seedling Pelargoniums, show varieties; also Fancy Pelargoniums, Calceolarias, Cinerarias, Fuchsias, Azaleas, Rhododendrons, &c., including a miscellaneous collection of Stove and Greenhouse Plants, is now published, and may be had by applying at the Nursery, Surrey Lane, Battersea, near London.

ROSES.

WILLIAM WOOD AND SON will be happy to forward Copies of their New ROSE CATALOGUE GRATIS on application.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

SEED TRADE.

J. G. WAITE begs to inform the Trade generally that he has the largest and best STOCK of SEEDS in the kingdom, which will enable him to supply his friends on better terms than any other house in the trade. Prices to be had on application at the Seed Establishment, 181, High Holborn.

*All Orders above 2l. will be delivered Carriage Free to any Station on the Great Western, Bristol and Exeter, or South Devon Railways, or to Cork, Dublin, or Belfast.*

Apply to WILLIAM E. RENDLE, Union-road, Plymouth, adjoining the terminus of the South Devon Railway.

G. JACKMAN, NURSERYMAN, Woking, Surrey, (1¼ mile from Woking Station, South-Western Railway), begs to announce that he has published a new and complete Catalogue of his American Plants, Ornamental Evergreens, Conifers, Flowering Shrubs, Standard and Dwarf Roses, Fruit and Forest Trees, &c., and may be had on application by enclosing two postage stamps.—Woking Nursery, Oct. 11.

BASS AND BROWN'S AUTUMN CATALOGUE is now ready, containing—

PART I. The New Geraniums, Fuchsias, Petunias, Verbenas, and other new and select Plants, at reduced prices.

PART II. Roses, select Evergreen and Flowering Shrubs, Climbers, Hardy Herbaceous Plants, &c.

PART III. Flower Roots, embracing splendid collections of Ranunculi, Gladioli, Early and Late Tulips, Iris, Lilies, imported Dutch Hyacinths, &c., &c.

Copies supplied on application, published complete with the newspaper stamp, to go free.

Seed and Horticultural Establishment, Sudbury, Suffolk.

PLANTING SEASON.

W. H. ROGERS, NURSERYMAN and LANDSCAPE GARDENER, 130, High-street, Southampton, begs to offer any quantity and description of finely grown and well-rooted NURSERY STOCK, including Forest and Ornamental Trees, Evergreen and Flowering Shrubs, American Plants, Fruit Trees, Roses, Herbaceous Plants, &c., &c., at a very reduced price.

Planting contracted for to any extent, engaging to replace failures. Gardens and Pleasure Grounds laid out and planted in the best taste.—All communications addressed to W. H. ROGERS, as above, will meet with immediate attention.

EDWARD GEORGE HENDERSON is now ready to send out his new CINERARIAS and FANCY GERANIUMS, for which he solicits early orders, as the stock of some of the varieties is very limited.

NEW CINERARIAS.

PRIMA DONNA (HENDERSON'S).—Large dark blue, fine broad petal, good form, and very dwarf habit. 1*s.* 6*d.*

MRS. SIDNEY HERBERT (HENDERSON'S).—White, with narrow carmine margin and carmine disc. A new and distinct colour, of good habit, and a handsome variety. 10*s.* 6*d.*

MARIANNE (HENDERSON'S).—Clear white, with a regular margin of rosy crimson, and black disc; first-rate form; a very handsome and striking variety. First class Certificates have been awarded to this flower. 10*s.* 6*d.*

ROSY MORN (HENDERSON'S).—Rosy crimson, with a white ring round a dark disc; good habit. 7*s.* 6*d.*

ST. CLAIR OF THE ISLES (HENDERSON'S).—White, with medium rosy lilac margin, and of dwarf habit; exquisite form. 7*s.* 6*d.*

MRS. CHARLES KEAN (HENDERSON'S).—White and bright deep rose, light disc; fine form and good habit. 7*s.* 6*d.*

MR. SIDNEY HERBERT (HENDERSON'S.)—Shaded purple, of fine form. 7*s.* 6*d.*

NONSUCH (HENDERSON'S).—Crimson plum; fine large flower; good broad petal. 7*s.* 6*d.*

CATHERINE SEATON (HENDERSON'S).—Bright rosy carmine, with a circle of white round a carmine disc. Gratis to purchasers of the set.

Price of the set, 3*l.* 3*s.*—The usual discount to the Trade.

NEW FANCY GERANIUMS.

BRIDE (HENDERSON'S).—Brilliant rose, with small white margin, and pure white centre; very free bloomer. 10*s.* 6*d.*

BEAUTY OF ST. JOHN'S-WOOD (HENDERSON'S).—Upper petals bright violet carmine, with a regular clear white margin; a regular belting of carmine runs through the under petals; good truss, and an excellent grower. 10*s.* 6*d.*

OTHELLO (HENDERSON'S). — Rich dark maroon upper petals, with smooth light margin; light blush under petals, with a belting of rich crimson in the centre of each; fine form. 10*s.* 6*d.*

PRINCESS ROYAL (HENDERSON'S).—Upper petals bright rosy carmine, with clear white margin; under petals clear white, with regular carmine markings, and clear white centre; good truss, and a very free bloomer. 10*s.* 6*d.*

AMBASSADOR (HENDERSON'S). — Large bright rose self, with a white margin; fine truss, good form and habit. 10*s.* 6*d.*

ANNETTE (HENDERSON'S).—An improvement on "Alboni;" very large truss, and an abundant bloomer. 10*s.* 6*d.*

The set, 3*l.* 3*s.*—The usual discount to the trade.

Wellington-road Nursery, St. John's-wood, London, Oct. 11.

AMBROISE VERSCHAFFELT, NURSERYMAN of Ghent (Belgium), has just published his new List of Plants, and may be had *free* at Mr. R. SILBEBRAD'S, 5 Harp lane, Great Tower-street, London. A. V. begs to offer to the trade fine Camellias and Azalea indica, full of flower buds, and at a very moderate price.

NEW STRAWBERRIES.—Triomphe de Gand, 5*s.* per doz. Merveille de Flandre, 5*s* ditto; Honneur de la Belgique, 2*s.* each; Duc de Brabant, 2*s* each; Comte de Flandre, 2*s.* each.

AURICULAS, ALPINES, POLYANTHUS, PRIMROSES, CARNATIONS, PICOTEES, PINKS, PANSIES, LANCASHIRE SHOW GOOSEBERRY TREES, &c.

JOHN HOLLAND'S CATALOGUES of extensive Collections of the above are now ready, and will be sent on application enclosing a postage stamp. Priced lists are given of every variety worthy of being added to a collection, and his stock was never in more robust health.

Bradshaw Gardens, Middleton, near Manchester.

HOLLYHOCKS, fine, warranted all double varieties, 5*s.* per dozen, 30*s.* per 100. Ditto Seedlings, from named flowers, 20*s.* per 100, 3*s.* per dozen.

LARGE MAJOR WHITE ROCKET, 15*s.* per 100, 2*s.* 6*d.* per dozen.

HERBACEOUS PLANTS, finest collection, 30*s.* per 100, 4*s.* per dozen.

Catalogues of Roses, &c., can be had for one stamp. Excellent assortment of Fruit Trees, Shrubs, &c.

DILLISTONE and Co., Sturmer Nurseries, Halsted, Essex.

TO FLORISTS, AMATEURS, AND GARDENERS.

M. WOOLLARD begs most respectfully to announce her intention to dispose of the entire Stock of FLORIST FLOWERS belonging to her late husband, consisting of a large collection of fine healthy plants of Auriculas; a very valuable collection of Ranunculuses; and all the new and best varieties of Carnations, Picotees, and Pinks.

Royal William Inn, Ipswich, Suffolk.

GOLIATH STRAWBERRY.—A Post-office order for 5*s.* will secure (package free) 100 strong plants of this celebrated Strawberry, or 12 plants, free by post, on receipt of 18 postage stamps. Also TROLLOP'S VICTORIA, 4*l.* per 100, and any of the old varieties at very low prices. The usual allowance to the trade.—JAS. KITLEY, Lyncombe Vale Nursery, Bath.

DUTCH HYACINTHS for Forcing, 3*s.* 6*d.* per dozen; Best do., for Glasses, 6*d.* to 1*s.* each. Double Roman and Paper-white Narcissus, 4*s.* per dozen; Single and Double Due Van Thol Tulips, 2*s.* per dozen. Also Crocus, Iris, Jonquils, Narcissus, Anemones, and Ranunculus, of which a priced List may be had free, per post, from A. CORBETT, Italian and Foreign Warehouse, 18, Pall Mall, London.

PINE PLANTS FOR SALE.—The different varieties of BLACKS and QUEENS, warranted clean and well rooted.—Apply to W. DAVIES, Starch Green, Hammersmith, near London.

FIRST CLASS PELARGONIUMS.—ROSA (Beck).—The best flower of its class. Strong and healthy; per plant, 15*s.*

Or, Rosa (Beck), Major Domo (do.), Silk Mercer (do.), Ajax (Hoyle), May Queen (Hoyle), and Flavia (do.), for 42*s.*

Also Emily, Loveliness, Rosalind (Beck), Constance, Magnificent, Field Marshal, Virgin Queen, Alonzo, Brilliant, Mont Blanc, (No. 2, Gipsy Bride), and Prince of Orange, for 21*s.*

Good old varieties, 9*s* and 12*s.* per dozen.

Choice PANSIES, 12*s.* per dozen.

Superb Border PICOTEES, fine Double CLOVES, &c., 5*s.* per dozen.

The above are strong and healthy, and will be packed in a basket (gratis), and carriage paid to London, or any station of the South Western or South Eastern Railways.

HART and NICKLIN, Florists, Guildford, Surrey.

Royal Pelargonium Nursery, Windsor, Oct. 4.

FIRST CLASS GERANIUMS.—TWO GUINEA SET.

WILLIAM E. RENDLE, Plymouth, FLORIST to her MAJESTY, will supply Twelve of the following first-rate GERANIUMS for 2*l.* 2*s.*, with a plant of Elliott's Surprise over.

RUNDLE'S BEAUTY OF MONTPELLIER; May Queen (Hoyle); Nectar Cup (Hoyle); Ajax (Hoyle); Rubiola (Hoyle); Isis (Hoyle); Flavia (Hoyle); Generalissimo (Hoyle); Gaiety (Foster); Corinne (Hoyle); General Jung Bahadour (Gaines); Lady Peel (Paley's, first time sending out); Candidate; Boule de feu; Village Maid; Cardinal (Hoyle); and Heartsease.

*Descriptions of* ELLIOT'S SURPRISE, *and* RUNDLE'S BEAUTY OF MONTPELLIER, *will be found in the* Gardeners' Chronicle, *Sept.* 13*th*, *page* 578.

| | s. d. |
|---|---|
| Twelve excellent GERANIUMS ... ... ... | 12 0 |
| Twelve excellent Fancy do. ... ... ... | 20 0 |
| Twelve excellent Scarlet do. ... ... ... | 15 0 |
| Twelve excellent CINERARIAS ... ... ... | 10 0 |

*For names of the varieties, see page* 578, *Sept.* 13.

*All Orders above* 2*l. will be delivered Carriage Free to any Station on the Great Western, Bristol and Exeter, or South Devon Railway, or to Cork, Dublin, or Belfast. All Orders attended to in strict rotation.*

*A large Collection of BULBS has just arrived from Holland, which will be offered at very reduced prices.—Catalogues on application.*

Apply to WILLIAM E. RENDLE, Union Road, Plymouth, adjoining the Terminus of the South Devon Railway.

SANGSTER'S NEW EARLY NO. 1 PEA.

HAY, SANGSTER, AND CO., in submitting the above valuable PEA to the public, can recommend it with the greatest confidence, as the largest podded and best Early Pea known, and of first-rate quality; height, 2 feet. Price 2*s.* 6*d.* per quart.

York Regent Potatoes, from prepared cuttings, 6*s.* per bush. Cambridge Radical do. (a first-rate second early) 6*s.* do. Early Oxford do., 10*s.* 6*d.* do. Early Ebrington Kidney do., 10*s.* 6*d.* do. Early Ash-leaf Kidney do., 10*s.* 6*d.* do.

Post-office orders to be made payable at the Borough Post-office to HAY, SANGSTER, and Co., Nursery and Seedsmen, Newington Butts, London. One-bushel hampers and booking, 1*s.* 6*d.*; two-bushel, 2*s.* 6*d.* Sacks, 2*s.* 6*d.* each.

VIOLETS.

TILEY'S VIOLA ARBOREA, OR PERPETUAL TREE VIOLET (TRUE).—In answer to numerous inquiries for the above, and great satisfaction given by the plants sent out last season, by EDWARD TILEY, he begs to state that he has this year a fine stock of the above beautiful Double Violet now to dispose of, which he can highly recommend, this being the proper time for making beds or potting. They are beautifully scented; the blooms are as large as the Double Blue Hepatica; they bloom freely from August till the end of May, and are perfectly hardy. Twelve of these plants grown in pots will scent a large greenhouse; and a small bed, 9 feet long by 3 feet wide, will be sufficient to furnish a family with bouquets, the whole of the winter and the spring. They should be planted in rather a dry situation and a loose soil, as the Violet will thrive and bloom finer than in wet or clay borders.

E. T. has been informed by the gentleman that introduced it into this country, that he has seen them growing in the thickets of Persia to the height of 4 feet, with large bushy heads to them, and hundreds of blooms on them at the same time. Large bushy plants, 6*s.* per dozen; smaller ditto, 3*s.* per dozen, or 1*l.* per 100. Any quantity of the above will be sent postage and package free.

STRAWBERRY PLANTS.

The undermentioned first-rate varieties are now ready to send out:—
Myatt's Surprise, sent out first time last season, 1*l.* per 100, or 3*s* per dozen.
Prince Arthur, do. do, 1*l.* per 100, or 3*s.* per dozen.
Myatt's Eleanor, the best and latest bearing Strawberry in cultivation, 5*s.* per 100.
Goliah, very fine ... ... ... ... 3*s.* per 100.
British Queen, do. ... ... ... ... 5*s.* ,,
Alice Maud, do. ... ... ... ... 3*s.* ,,
Black Prince, very early ... ... ... 5*s.* ,,
Prolific, very fine and early ... ... ... 5*s.* ,,
Cremont's Perpetual, or double-bearing Strawberry, 12*s.* per dozen, or 4*l.* per 100.
Trollop's Victoria, 12*s.* per dozen, or 4*l.* per 100.
The above are strong and well-rooted plants, such as will insure satisfaction. Any of the Strawberries that are priced, per dozen, can be sent free by post; also those priced, per 100, will be sent package free.
Fine Giant Scarlet Brompton Stocks, Plants that have been all pricked out, 2*s.* 6*d* per 100.
Also, some fine Antirrhinums, all saved from striped and spotted varieties, such as will give every satisfaction, and bloom early next spring, 5*s.* per 100.
Fine Sweet Williams, such as will bloom next season, saved from 50 distinct varieties (the plants are strong and good), 5*s.* per 100, or 1*s.* per dozen. Can be sent by post with any of the above.

WINTER CUCUMBER.

Lord Keynon's Favourite, the best variety for winter cultivation, 2*s.* 6*d* per packet.
A remittance is expected by Post-office order, or the amount in penny postage stamps.
EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Churchyard, Bath, Somersetshire.

EARLY CABBAGE.—Stout Bedded Plants of superior true sorts, 4*s.* 6*d* per 1000, package included, delivered free of carriage to the Edenbridge station of the South-Eastern Railway.—Address, JOHN CATTELL, Westerham, Kent. Cash or stamps must accompany orders from unknown correspondents.

NEW STRAWBERRY PLANTS.—

| | | |
|---|---|---|
| MYATT'S EARLY SURPRISE | ... | 18*s.* per 100. |
| ,, ELEANOR ... ... | ... | 4*s.* ,, |
| KITLEY'S GOLIAH ... | ... | 5*s.* ,, |
| WILMOT'S PRINCE ARTHUR ... | ... | 40*s.* ,, |
| HOLLYHOCKS, Splendid Double Varieties ... | | 40*s.* ,, |

With every other variety in cultivation. Can be had at J. G. WAITE'S Seed Establishment, 181, High Holborn.

SEEDLING CINERARIAS.

W. IVERY begs to offer the following new varieties, which are now ready.
CINERARIA "BEAUTY," pure white ground, edged with lavender; form extra fine. Recommended by the National Floricultural Society. Price 7*s* 6*d.*
CINERARIA "HAMMERSMITH BEAUTY," blue, with white centre, very dwarf habit; most showy and distinct variety ever offered. Price 5*s.*
W. I. can also supply good plants of the undernamed fine varieties: Blue Perfection (Ivery's), 3*s.* 6*d.*; Empress (do.), 2*s.*; Electra (do), 3*s.* 6*d.*; Fearless (do.), 2*s.* 6*d.*; Little Wonder (do), 2*s.* 6*d*; Madame Miellez (do.), 3*s.* 6*d.*; Madame Castellan (do.), 2*s.* 6*d.*; Monarch (do.), 2*s.*; Bessy (Henderson), 2*s.*; Effie Deans (do.), 3*s.* 6*d.*; Flora M'Ivor (do.), 2*s.*; Lady Araminta (do.), 2*s.* 6*d.*; Lady Hume Campbell (do.), 5*s.*; Pauline (do.), 2*s.* 6*d.*; Wellington (do.), 2*s.* 6*d.*; Alboni (do), 1*s.* 6*d.*; Privateer (Ambrose), 2*s.* 6*d.*; Mademoiselle Parodi (Henderson), 2*s.* 6*d.* Selection left to W. I., 12*s.*, 18*s.*, to 24*s.* per doz.
Select Catalogue of Show and Fancy Geraniums, Fuchsias, Verbenas, Cinerarias, Antirrhinums, Choice Plants, Phloxes, and Chrysanthemums, may be had on application.
Hanover Nursery, Peckham, near London.

ABRAHAM HARDY AND SON, SEED GROWERS and SEEDSMEN, Maldon, Essex, beg to inform their friends that Autumn, Winter, and Early Spring are proper seasons for Sowing or Planting the HERACLEUM GIGANTEUM and HERACLEUM SPHONDYLIUM. The former is a magnificent hardy and ornamental Plant from Siberia, grows 14 feet high, with flowers 12 feet in circumference, and leaves 5 feet wide. Seeds, 6*d.* per packet; large plants 1*s.* each. The latter is a British plant, which improves by cultivation, very useful and proper for cattle, especially for pigs and rabbits in large towns, growing abundance of food on a small space of ground; cultivated Seeds for one rod, 6*d.*; for ¼ acre, 7*s.*; directions, &c. All free by post.
HARDY'S selected early varieties of Potatoes for autumn planting, 5*s.* per bushel, sacks included, and carriage to London. Treatise on Potato Culture, 6*d.* Remittances requested.

EXOTIC NURSERY, KING'S-ROAD, CHELSEA.
We have a fine stock of ARAUCARIA IMBRICATA, CEDRUS DEODARA, RHODODENDRON PONTICUM, in remarkably well-grown plants, of various sizes. This being the best time of the whole year for planting them, we beg respectfully to recommend them in an especial manner, to those who intend embellishing their estates and gardens by ornamental planting, and shall be happy to furnish size and price when applied for. KNIGHT and PERRY.

THE MOUNTAIN OF LIGHT, a new variegated GERANIUM, of dwarf habit, and free growth. The centre of the leaf is deep green, with a broad margin of pure white. The truss is of medium size, the pips very round, and the colour the most intense scarlet. It is a very free bloomer.
First-class Certificates have been awarded to it by the National Floricultural Society, and the South London.
JOHN AND CHARLES LEE intend sending out this desirable variety (which eclipses all former introductions in this class), on the 31st instant. Price 10*s.* 6*d.* each. Early orders are requested, as the stock is limited.
Nursery, Hammersmith.

SEEDLING FANCY PELARGONIUMS.

W. P. AYRES begs to announce that his SEEDLING FANCY PELARGONIUMS, as fully described in the *Gardeners' Chronicle* of October 4, p. 626, will be ready to send out as under. The usual discount to the trade, and a plant of one of the Guinea kinds over in every set ordered.

On the 20th October, the following—

| | | | |
|---|---|---|---|
| Alboni Superb ... | 10*s.* 6*d.* | Formosissimum ... | 31*s.* 6*d.* |
| Caliban ... ... | 21 0 | Gipsy Queen ... | 21 0 |
| Celestial ... ... | 21 0 | Miranda ... ... | 21 0 |
| Sambo ... ... | 7*s.* 6*d.* | | |

At the end of March, or early in April, 1852, the following—

| | | | |
|---|---|---|---|
| Advancer ... ... | 31*s.* 6*d.* | Conspicuum ... | 21*s.* 0*d.* |
| Brunette ... ... | 10 6 | Kentish Beauty ... | 21 0 |
| Painted Pet ... ... | 25*s.* 0*d.* | | |

In relation to the Silver Cups offered as Prizes in June and July for the best six plants selected from the above list, W. P. A. begs to state that those growers who signify their intention to compete before the 1st November, will receive strong plants of "Advancer" and the other kinds to be sent out in April, in the middle of February. Nurserymen, as well as Amateurs, will be allowed to compete.
W. P. A. having a stock of nearly 5000 plants of the leading named Fancy varieties, can supply fine established plants in vigorous health at 12*s.*, 18*s.*, 24*s.*, 30*s.*, to 100*s.* per dozen, the selection being left to himself. Purchasers are advised to send a list of the varieties they already possess, so that duplicates may be avoided.

| | | |
|---|---|---|
| 12 fine and distinct Exhibition varieties | ... | 31*s.* 6*d.* |
| 12 very superior ditto | ... ... | 42 0 |

FANCY PELARGONIUMS.—Alboni, Admirable, Anais, Beauty, Belle d'Epiney, Bouquet tout fait, Defiance, Duchesse d'Aumale, Empress, Esmeralda, Evangeline, Fairy Queen, Fellowsiaaum, Formosa, Gaity, Garland, Hero of Surrey, Ibrahim Pacha, Ioliuskii, Jehu, Jehu Superbum, Jenny Lind, Katty Hayes, La Belle d'Africana, Lady Rivers, Lady Louisa Cornwallis, Lady St. Germain, Lilacina, Lizzey Lindsey, Lucy Neal, Madame Miellez, Magnifica, Mazeppa Superb, Minerva, Modesta, Modesta Superb, Orestes, Odorata, Magnifica, Parodii, Perfection, Pilot, Purity, Princess Maria Galitzen, Picturata, Pencillatum, Queen Superb, Queen Victoria, Quercifolrum Superbum, Reine des Francais, Statiaskii, Village Maid, Wintonia, and Wizard.
W. P. A. has also many thousands of the leading Show Pelargoniums, fine vigorous plants, which he can supply as under:
12 selected from the following, 42*s.*, or 6 for 21*s.*
Beauty of Montpelier, Ajax, May Queen, Ocellatum, Nectar Cup, Isis, Flavia, Cardinal, Generalissimo, Corinne, Prince Arthur (Pontey), Fairy Queen (Seedling), Alderman, Constance, Prince of Orange, Magnificent, Conspicuum, Rowena, Christabel, and Virgin Queen.

| | | |
|---|---|---|
| 12 Pelargoniums, all show kinds of this season | | 15*s.* 0*d.* |
| 12 ditto superior ditto ... | | 21 0 |
| 12 First-rate show kinds, including Ocellatum, May Queen, and Flavia ... ... ... | ... | 30 0 |

Carriage free to London, and plants to compensate for package and long carriage.
*** When cash or a Post-office order accompanies the order, a discount in plants of 10 per cent. will be allowed. Post-office orders payable at Greenwich to WILLIAM PORT AYRES.
Brooklands Nursery, Blackheath, Oct. 11.

WILLIAM HAMILTON, SEEDSMAN, &c, 156, Cheapside, London, will forward his CATALOGUE of BULBOUS ROOTS (of which he has a large collection), on application.

| | s. d. |
|---|---|
| Hyacinths, superior sorts, named, per doz. ... | 6s. and 9 0 |
| Narcissus, very fine large roots, each ... | 4d. to 0 8 |
| Tulips, for early forcing, per doz. ... ... ... | 1 0 |
| Crocus, mixed, for border, per 100 ... ... ... | 1 6 |
| ,, very fine named, per 100 ... ... ... | 2 6 |
| Snowdrops, single or double, per 100 ... ... ... | 2 6 |
| Ixias, of sorts, named, per doz. ... ... | 2s. to 4 0 |
| ,, very fine, mixed, per doz. ... ... ... | 2 6 |

Gladiolus, Lilies, Jonquils, Amaryllis, Ranunculus, Anemones, and a number of other roots for which see his Catalogue.

RENDLE'S LIST OF NEW GERANIUMS will be found in the columns of this Paper, page 578, in the Number for September 13, 1851.

WILLIAM E. RENDLE, Florist to her Majesty, Plymouth.

FANCY PELARGONIUMS.

W. P. AYRES begs to announce that his Descriptive Catalogue of Seedling Fancy and other PELARGONIUMS, CINERARIAS, CALCEOLARIAS &c., will be published in a few days, and will be forwarded upon prepaid application. His Seedling Fancy Pelargoniums will be ready for delivery on and after the 20th of October, but the stock of some of the kinds being limited, early orders are indispensable to insure the collection.

Brooklands Nursery, Blackheath, Oct. 11.

RED LODGE NURSERY GROUNDS, North Stoneham; SEED WAREHOUSE and FLORICULTURAL GARDENS, No. 181, High-street, near the Bar Gate, Southampton.

W. ROGERS, SEN., NURSERYMAN and CONTRACTING PLANTER, begs to inform the Public and those interested in Planting that he intends selling at very reduced prices, the fine Stock of FRUIT, FOREST, ORNAMENTAL TREES and SHRUBS (extending over 60 acres of land) in the forthcoming planting season, priced catalogues of which may be had, wherein will be enumerated all the newly-introduced hardy CALIFORNIAN and CHINESE SHRUBS, CONIFERÆ, RHODODENDRONS, and ROSES, which are added to the stock and cultivated as soon as they appear, it being his determination that these old-established nursery grounds shall continue to merit the patronage of the nobility and gentry so liberally conferred upon him for the last 40 years.

A Gardeners' and Land Stewards' Registry is kept at his office in the town, where men of experience and ability may be always obtained.

The following will be found particularly fine, and in great abundance:—Larch, Scotch Spruce, Pineaster, and Sea Pine, Fir, Hazel, Oak Quicksets, Mahonia (for cover), and Rhododendrons of all sizes, from 4 inches, 40s. per 1000, to 2, 3, and 4 feet, 10s. to 30s. and 40s. per 100; Abies Douglasii, 2 feet, 30s. per dozen, and 2 to 3 inches, 5l. per 100, or 18s. per dozen. Double Camellias, 12s. per dozen; Single Camellias, fit for working, 30s. to 40s. per 100; Dwarf Boursault Rose stocks (strong), 6s. per 100.

SUPERB HOLLYHOCKS.

R. B. BIRCHAM, Hedenham Rosary, Bungay, Suffolk, begs to state that his Descriptive CATALOGUE of the above splendid flowers is now ready, containing all the best in cultivation, and including some first-rate Seedlings.

R. B. B. begs to offer strong ground roots, selected when in bloom, from some thousands of seedlings; these are fine double flowers and splendid colours, and will prove a superior class of flowers for the border and shrubbery; 9s. per dozen.

A Descriptive Catalogue of the best Roses in cultivation, including upwards of 300 of the best hardy varieties. R. B. B. will be happy to forward the above lists on prepaid application. Package carefully attended to; extra plants included, to compensate for distant carriage. Carriage paid to London per Norfolk railway.

DUTCH FLOWER ROOTS.

RENDLE'S LIST OF DUTCH BULBS will be found in the columns of this Paper, front page, in the number for September 27, 1851. The prices are very low. Descriptive Catalogues on application to WILLIAM E. RENDLE, Florist to her Majesty, Plymouth.

*The Hyacinths are particularly large and handsome. Most excellent kinds can be had at 6s. per dozen.*

The Gardeners' Chronicle.

*SATURDAY, OCTOBER* 11, 1851.

IT is some consolation to know that one enemy to the gardener is thoroughly subdued. If we cannot manage the Potato disease, at least we can defy the VINE MILDEW. An exhibitor of excellent mildewed Grapes declared, at the last horticultural meeting, that he cared no more for egg-mildew in a Vinery than for green-fly in a Cucumber bed. And he was right. What tobacco will do in one place, sulphur will do in another. Smoke your green-fly, brimstone the egg-mildew. Black Hamburgh Grapes were produced by Mr. FRY, and Black Prince Grapes, from the Garden of the Horticultural Society, as well grown, and as well coloured, and as well flavoured, in the midst of mildew, as if no such malady were known. Nevertheless A B and C declare that they have killed their Vines instead of curing them, while E F and G maintain that sulphur is of no more use to a Vine than homœopathic pills to an ass.

The cause of the failures that have taken place is not determinable, the *modus operandi* not being traceable by those who are not witnesses of it. A B and C, however, have no doubt fired their sulphur, an ingenious process, by means of which they have scorched their Vines, and if we may say so, burnt their fingers. On the other hand, E F and G may be suspected of having been frightened at powdering Vines with absolute brimstone, and may have delicately preferred water in which it has been steeped; in doing which they are not unlike the folks who content themselves with having been absent from the Crystal Palace, by reflecting, that at any rate they have seen people who have been there. Others, may be, have waited till the evil was incurable, and some may have been deterred from the true method of cure from fear that the Grapes will eventually smell of sulphur.

At all events, it is certain, that if flower of sulphur is powdered over the *dry* leaves and berries of Vines when first attacked, the mildew will be stopped; and that if it reappears, it may be stopped again by the same means, till at last it disappears, and the Grapes ripen. There is no fact more certain than this. But the sulphur must be left on the leaves and berries, not dusted on and washed off again like plate powder on a silver fork. It must remain, and be allowed to act. Left alone it will do no harm, washed off it will do no good. It may remain on the berries till they are ripe and wanted for table. Fine folks need not be alarmed at this; they will never know that their Grapes have been brimstoned. It is only necessary to syringe the bunches with a very fine rose, so that the water falls on the berries like heavy mist, and in a short time every particle of sulphur will be washed off; or they may be plunged in water, and drawn gently through it. After this, then, neither taste nor smell remains, for the sulphur is wholly gone.

A difficulty has been found by some people in dusting their Vines with sulphur; and as dredging-boxes and powder-puffs are apt to act upon the dresser, as well as the dressee, ingenious mechanicians have provided, and even patented, their "sulphurators." But there is no need of an elephant to drag a dog-cart. A pair of bellows fitted with a tin box communicating by holes in the bottom with a long tube instead of the usual pipe of the bellows is as good as anything. The sulphur drops into the tube through the holes, and is driven forward by the blast. But as flower of sulphur is apt to clog, and refuse to fall through the holes in the bottom of the box, an ingenious Frenchman thought of a plan for patting, or, if you will, rapping the box, so as to displace the sulphur at every puff of the bellows. For this purpose, he attached a long, weak, steel spring to the under-side of the bellows, and secured to the free end of the spring, next the sulphur-box, a hammer-head, which constantly strikes the tube of the bellows, as the bellows are moved in the act of blowing. The result is, that while the bellows say, "Puff, puff, puff," the hammer strikes, "Pat, pat, pat;" and between puffing and patting, a constant cloud of sulphur is directed to every place where it is wanted.

WE must again invite the attention of our readers to Mr. LAWES' long and laborious series of experiments on the Chemistry of Vegetation, which, as we recently observed, are characterised by LIEBIG as being of no practical value for the foundation of general conclusions; a remark probably made in a moment of haste and ill-humour, perhaps even without being thoroughly aware of the true nature and aim of the experiments there condemned. In order to explain the matter fully, it will be necessary to advert once more to the so-called mineral theory of LIEBIG, which is in fact the foundation of the whole discussion, and to which its author appears inclined to adhere with a good deal of tenacity, in spite of all that may be urged against it.

It is perhaps hardly to be wondered at, that the small quantity of inorganic matter which plants contain was formerly considered as being accidental, or at least of no real value, and not in any way essential to their growth and prosperity; at all events, such was certainly the case, and even after the minute and laborious investigations of SAUSSURE, it appears that very little attention was paid to the subject, for DAVY evidently thought them of little or no importance, when he wrote his celebrated lectures on agricultural chemistry. Isolated writers have now and then drawn attention to the existence of these substances in plants, and have indeed pointed out the necessity of their being present in those plants which serve as the food of animals. Thus, for example, it has been long known and admitted that cattle derive a large portion of phosphate and carbonate of lime, the earthy matter of their bones, from the Grass and other plants on which they feed. LIEBIG was the first to insist on the paramount importance of these inorganic substances to plants, which he asserted were absolutely essential to their growth; and indeed he went so far as to say that vegetation was healthy and luxuriant just in proportion to the supply of these substances. In accordance with this view he put forth his theory of exhaustion and fallowing, asserting that the sole reason why a plant could not be cultivated year after year on the same soil, was, that the supply of soluble inorganic matter necessary for the plant soon became exhausted, and that this loss must be remedied either by leaving the soil for a year or two to recover itself under the agency of atmospheric influence, or by the addition of suitable mineral manures. It is often stated that LIEBIG discovered the real office performed in the nutrition of plants by these inorganic matters, and hence threw a good deal of light on the subject; but this is not really the case; for of the true use of the inorganic constituents of plants very little indeed is even now understood. We know that they are essential to vegetation, but we do not know why, or in what manner they act; this still remains to be discovered.

The two great facts which LIEBIG brought forward in a prominent manner, were, the necessity of these substances being present in a fertile soil, and the fact that different tribes of plants require the presence of different inorganic matters; some requiring phosphate of lime, some needing alkali, and some requiring silica. These facts are certainly of the very first importance; but it is obviously impossible to arrive at any very satisfactory conclusion as to the mode in which these substances influence vegetation, until we fully understand the office which they perform, and the effects which they produce. It is quite plain that these inorganic matters cannot in any way serve as food, or at least cannot directly contribute to the supply of carbon, nitrogen, &c.; but at the same time there is no doubt some very simple relation between the absorption of these earthy and saline compounds, and the absorption or assimilation of carbonic acid, ammonia, and water. The practical problem to be solved was, is it most important to supply inorganic matter, or ammonia, to plants? or in other words, must we give plants ammonia, and will that enable them to absorb enough inorganic matter from an exhausted soil, or must we give them inorganic manures; and will they then be able to absorb from the air and soil all the ammonia which they require?

The answer which LIEBIG gave to this important question was, that inorganic manures were of far more value than those which merely contained ammonia; an assertion based solely on hypothetical conclusions, and therefore, especially when we bear in mind how little is really known of the action of these substances, one which ought to be viewed with the greatest caution and circumspection. A great many persons were at once satisfied that LIEBIG's view of the subject must be correct, but there were some who wished to have proofs before they admitted it, and Mr. LAWES was one of those; he accordingly instituted, in conjunction with Dr. GILBERT, a very careful series of experiments, and the result of these experiments is now published, in the Journal of the Royal Agricultural Society. These investigations of Mr. LAWES, as far as they go, are very satisfactory; and whilst we should be the last to admit them for more than they are worth, we feel that the manner in which they have been arranged and conducted is such as to render them wholly trustworthy. They plainly lead to certain conclusions, which we may safely adopt, without fear of being misled.

At an early period in his experiments, Mr. LAWES was led to the conclusion, that very little real information can be derived from the analysis of a soil; because our chemical tests are not delicate enough to detect the less abundant constituents; or to render evident those changes in its composition, which the growth of one or two crops could possibly produce. The soil of an acre of ground, supposing it to be 6 inches in depth, would weigh about 1,344,000 lbs., and consequently the subtraction of a hundred weight of any one ingredient would only amount to about one 13,000th part of the whole, a quantity far too minute to be satisfactorily determined by analysis. Mr. LAWES, in his experiments, therefore, proceeded on a plan in which this difficulty was obviated; he took a field, the soil of which was thoroughly exhausted by heavy cropping, so that without manure it would only produce a poor crop, showing, therefore, that something was deficient; and dividing it into several portions he manured each separately, giving to some ammoniacal manure, to some inorganic ones, and to others a mixture of the two. These experiments were continued on the same fields, and with the same manures, for seven years; so that the value of each class of manure was fairly tested with different plants; and the whole of these results are now before us. The paper is well worthy of careful study, and though we shall mention briefly some of the conclusions to be drawn from them, yet we would recommend every one to read the original account of the experiments, and to judge for himself of their value.

Mr. LAWES found that the ashes of farm-yard manure did not increase the yield of Wheat on exhausted land at all, whilst a small dressing of sulphate of ammonia increased it 5 bushels per acre; and when a mixture of inorganic matter and ammoniacal salts was contrasted with the effects of either taken singly, it was evident that the restoring influence of the latter was far higher than that of the former alone. The practical conclusion, therefore, to which Mr. LAWES arrives is, that in this country the soil becomes exhausted of its ammoni-

cal salts much sooner than of its soluble inorganic components; and, therefore, that ammoniacal manures are more important than mineral or inorganic ones in the cultivation of Wheat. In considering these results, one important fact must be borne in mind; the land on which these experiments were made is by no means a poor soil, for, even though exhausted at the commencement, it bore successively for seven years, without any manure, an average crop of 17½ bushels of Wheat per acre; it is plain, then, that it would not be expedient to deduce from such experiments any general conclusion for all soils. Mr. Lawes denies that inorganic manure is all-important for Wheat, in all situations; but he does not deny that there may be poor soils and peculiar circumstances, in which the supply of ammonia is greater than that of inorganic matter; and which, therefore, the nitrogen being in excess, relatively to the mineral constituents of Wheat, would be less easily exhausted. Under such circumstances a mineral manure would be more useful than an ammoniacal one. We must be careful in rejecting the assertion of Liebig, that we do not fall into the opposite extreme. After having found that mineral manures are not the best in all cases, we must not conclude that ammoniacal ones are always best; neither would be true, as a generalisation.

## VINE MILDEW.—No. II.

Up to the present time there are but two opinions respecting the disease of Vines: the one generally adopted, which attributes it to the development of the Botrytis* and my own, for I am in point of fact the only person who considers the fungus as one of the consequences of the disease. This divergency of opinion induces of necessity another, in the treatment of the malady, with a view to its cure.

M. Duchartre, Professor of the Agronomic Institute of Versailles, in a report addressed to the Minister of Agriculture, on the means of combating the effects of the fungus which attacks the Vines, said, "I am to-day happy in being able to announce to you that the treatment to which the diseased Vines have been submitted has given excellent results, and that henceforth we may flatter ourselves with being able to combat it with success whenever it may appear."

The remedy employed by M. Duchartre consists in dashing over the diseased Vines, by help of a garden syringe pierced with rather large holes, water in which flowers of sulphur are held in suspension.† This simple, inexpensive mean, by common consent, has been most successful. The employment of sulphur in this form had already been recommended by Mr. Kyle, an English agriculturist, who had discovered its properties. These advantages cannot be called in question, and I have no thought of doing so; I have myself witnessed them, but I have witnessed those also which I have myself obtained in the month of July by syringing with water in which was dissolved a small quantity of common salt, or sulphate of iron. My own treatment has only served to wash off the fungus as fast as it appeared. When the disease was over everywhere, I have compared the results obtained in plants which had been experimented upon with those which I had left to their unhappy lot. I then saw no difference, the bunches were completely dry, or only retained a small number of berries. Amongst these some were small, cracked, and deformed; others appeared not to have been affected.

The experiments which I made were commenced too late; they would have been more successful at the commencement of the malady, as I have assured myself from late bunches which did not blossom till the end of July. In these the berries presented no trace of disease. I have made but one experiment with sulphur, and my Vine, at the time of maturity, did not appear to me in better condition than the others.

I conclude from my researches that the malady which raged amongst Vines in 1850, and principally in the Chasselas in the neighbourhood of Paris, and in many other parts of France, is not epidemic but endemic; that it is due to a primitive, special, unknown corruption of the young branches, leaves, stalks, and berries; and that Oidium Tuckeri, instead of being the cause, is only one of its consequences.

That if we wish to prevent, not the ravages, but the development of this fungus, we must not allow ourselves to be taken by surprise, as we did through the summer of last year, but commence from the beginning at the moment of flowering, on the first symptoms of the disease, and not when it is generally dispersed, for then it has produced its effects, and it is difficult to appreciate the advantage of the means which have been employed.

That if, as I believe, the disease does not come from without, but that it is inherent, and belongs to the tissues and juices of the Vine, we must seek the cause and means of counteraction in some accidental circumstance or the mode of cultivation. What seems to prove this is, that the disease has been more virulent in white than in black Grapes, and that the Vineyards have been spared while the trellises have suffered.

I shall terminate these remarks by a final observation on the mode of propagation of Oidium Tuckeri. Professor Brongniart told me lately that some persons thought they had remarked that the fungus appeared first in stoves where the Vine is cultivated to obtain early Grapes, and that by degrees it was communicated to the surrounding trellises. This point of origin, if it were well established, would militate strongly in favour of contagion, but in truth it proves nothing. In fact, if the malady is endemic, if it is connected with a particular condition of the Vines, it is very natural that those which are enclosed in stoves should be more diseased than those which are in the open air, since their vegetation is earlier than that of the others. The fungus cannot be developed at the same time on plants which are placed in very different circumstances. I am well aware that it may be objected that the one prepares and preserves the elements of contagion till the others are in a fit condition for being infected, but why then this preference for white Grapes, and repugnance for those that are black! In this case the Vines, whether staked or on trellises, should be diseased, and we see the malady rage principally in Vines attached to walls, or surrounded by inclosures. There is then something in this question which belongs evidently to aspect and cultivation. If contagion exists, the malady cannot cease to prevail in stoves, and in Vineyards it ought to take place as well in the month of September as in the month of June or July, which is exactly the contrary to what really does take place. If, on the contrary, the Vine itself is affected in the first instance, we see the Oidium prevail as long as the disease lasts. When the points which were diseased are cicatrised or dry, it disappears naturally, and does not invest, as it ought to do, the surrounding surfaces which are sound. The moulds are great gluttons; they are to vegetable what insects are to animal substances. They do not abandon their prey, or rather cease to vegetate, except when there is nothing left to feed upon. They could then be propagated in the months of September and October, because at this time atmospheric momenta are certainly as favourable for their development as in the months of June or July. But they are not propagated, because the vital conditions of the Vines are not the same.

Let us admit for the moment that Oidium Tuckeri grows in stoves, and that it spreads from thence into the surrounding districts. By what means ought we to attack it? There is but one. The focus of infection is known; it is necessary in consequence to root up the plant. In doing so the proprietor will not make a great sacrifice, since the Grapes which he cultivates are not saleable when diseased, and he will not have to regret being the involuntary cause of greater mischief."

The importance of the foregoing memoir cannot be denied, though written under very strong views with regard to the effects of fungi on living vegetables, and as it seems to me chargeable in parts with what the Germans call inconsequence. The fungal theory of the Potato disease, as it is termed, was nowhere more strongly opposed or even ridiculed than in France, insomuch that more than one botanist who commenced with it, was forced to yield to the pressure from without. It is extraordinary, however, that of all the theories that were broached, none has been retained by their several advocates except the fungal theory, which not only is as ardently retained as ever by its first adherents, but is daily gaining ground, and has been eventually adopted by some who were at first the strongest in their opposition. I am not, however, going to discuss again a subject which has been so much canvassed, or which has lost its interest with most readers. My opinions were fully stated in the first number of this Journal, and I have never yet seen reason to alter them.

It is curious that with respect to the Vine disease, the majority are in favour of the fungal theory, and my friend Dr. Léveillé is almost alone on the other side. It is not to be denied that his arguments are extremely plausible, and that there is much in his observations that is worth attentive consideration, but I cannot always admit his data. It may be very true that neither he nor M. Decaisne, of whom no botanist will speak without the greatest respect and self-distrust, have been able to detect mycelium within any part of the plant; but it is no less true that myself and Mr. G. Hoffman have seen it most distinctly, and that the figure given in the *Gardeners' Chronicle* in November, 1847, was drawn from specimens lying on the field of the microscope, in which the growth through the stomata was as evident as that of Botrytis infestans, through the stomata of the Potato. The disease, far from disappearing early, as related in Dr. Léveillé's notes, continued, at least in some instances, in this country as long as the leaves were on the trees, specimens having been forwarded to me from Margate quite late in the year from Vines which I had studied in July; and in November Mr. Hoffman, than whom there are few more careful observers, and who has an excellent microscope, with very great powers of manipulation, assured me that he then distinctly traced the mycelium in the buds when the leaves had fallen.

The same excellent observer witnessed its propagation from the Vine on plants of Chrysanthemum indicum placed purposely beneath, and which were in consequence materially injured. I do not for a moment doubt the correctness of a single observation of Dr. Léveillé, as far as it goes, but the circumstances under which disease of all kinds is generated [illegible] that it is impossible to come to any conclusions from the simple fact of certain individuals escaping where others are attacked, and it is very easy to conceive that where the attack proceeded from within the tissues, as in this case, if I am correct in my observations, the injury would be greater than where the fungus was propagated secondarily on external surfaces from fallen spores. It is very possible, that while superficial it may do no further harm than clogging up the superficial spores, and hindering the due access of light and air, and that it is only directly destructive where it enters the tissue through the stomata; but this, of course, is mere conjecture. The great point is to attend to facts. The disease was observed in England about two years previously to 1847, and till Mr. Tucker, after whom the mould was named, employed the same remedy, or at least a form of it, which has long been efficacious in the case of Peach mildew, the destruction was complete. Mr. John Boys, an eminent solicitor and magistrate at Margate, who has long paid especial attention to the cultivation of the Vine, has informed me that one of his own Vines, and another which he had an opportunity of examining, were completely killed by it, and that in his case even the pith of the branches was affected. He has told me, besides, that 30 plants of the Constantia Grape, raised from eyes received directly from the Cape, were all strongly affected, though there was not the slightest reason to believe that the plants from which the eyes were taken were diseased. Though the destruction was at first complete, as regarded the crop, and, as stated above, in two instances the disease was fatal to the Vines themselves, since he has adopted the system of washing the flues when warm, but not too hot, with black sulphur and quicklime, in the proportion of four ounces of each to sufficient rain-water to make the mixture of the consistence of cream, with frequent syringing with pure water, though the disease has shown itself again and again, his crop has not suffered.* In this case there was no question of the mildew ceasing after the disease had been established, as mentioned by Dr. Léveillé; but the progress of the malady was completely arrested, which would not probably have been the case had the Grapes suffered from some inherent corruption of the tissues themselves.† And the experience of Mr. Boys is borne out by the testimony of the great body of Grape growers in the south of England. As the sulphur is the well-ascertained cure of the fungus to which Peach mildew is due, it is more than natural to conclude that the cause is somewhat similar in Grape mildew, where the effect is equally beneficial. Salt was not found efficacious in England; and where sulphur is used, except in the form of vapour, it must be used in substance, as it is insoluble in water. How it acts upon the mould is not known, but doubtless some decomposition takes place, and where used in combination with lime the sulphate of lime may act as a stimulant to the vegetative powers. Possibly, a combination of quick-lime and Glauber's salts, as recommended with such great benefit in the case of Bunt, might be an improvement on the methods hitherto practised.

It is curious that the Grape mildew has taken a course nearly contrary to that of the Potato disease. It appeared in Kent about 1845, and is at this time prevalent on the opposite coast of Essex, and has now extended southward as far as Naples. At Genoa scarce a Vine is free, and the black Grapes appear to be attacked quite as much as the white varieties, even the Vitis Labrusca suffering from its ravages. In the north and midland counties of England I believe the disease is unknown, and I have not heard of its appearance in Germany.

Where the mind can be brought to adopt the notion of spontaneous or equivocal generation, there is little difficulty in these matters, or at least the difficulty is thrown aside; but as all patient investigation, and one which will not submit to jump hastily to conclusions from imperfect data, is against such notions, we must be content to treat the propagation of even such minute bodies as Oidium Tuckeri as we do those of phenogamous plants. When a large crop of white Clover makes its appearance on lands recovered from the sea, it is an easy solution of the difficulty to say that the plants have been generated spontaneously from the soil. It may not be easy to account for their presence, but yet the lover of truth will not readily solve the difficulty by such an unwarranted conclusion. In the case of the Potato disease and of the Grape mildew it appears

* This is probably a slip of the pen for Oidium, a true Botrytis of the same section with Botrytis infestans, but far more beautiful, and highly developed, and, like all the allied species preying on the parenchym, occurs in South Carolina on the Vine leaves. I have not, however, heard that it is injurious. My specimens, which were gathered by Mr. Ravenal, and have been named B. viticola, Berk. and Curt., occurred on Vitis æstivalis, and, I believe, on some other species.

† As the sulphur is not soluble in water, care must be taken that the powdered mineral is held in suspension. This remark is necessary, as some authorities have recommended the water to be drawn off clear. *M. J. B.*

* It is obvious that great caution must be exercised in this kind of fumigation, and that a gentle current of air should be allowed to run from the bottom to the top of the house (not, however, suffering the temperature to get at first below 65°), as soon as the fumes have been allowed sufficient time, which should never exceed an hour, even in the most virulent cases. Indeed, under any mode of treatment, thorough ventilation is a most important element. The mixture of lime and black sulphur was used where the flues were not of iron; in the case of iron flues, it is recommended simply to dredge them with sulphur; the heat, however, must not be such as to ignite the sulphur.

† It is but fair that I should state that Mr. Boys does not attribute the disease to the Oidium, but to some disturbance of the electric currents of the earth—an opinion to which he has been led from constant observation of a thermometer plunged 20 inches below the surface of the soil. The disease, he states, first appeared with him in 1846, in remarkably fine and dry weather, subsequent to a cold and wet spring. The roots of his Vines, in consequence of the drought, had been kept wet with liquid manure, the temperature of the earth being comparatively low. In regard to the use of remedies, he recommends cultivators to watch for the very first indications of the white bloom which constitutes the Oidium, and then, in four or five days, the cure is certain. A few days' neglect will require greater perseverance in the use of the remedy; but if the young Grapes once split and become deformed, it may

pretty clear that the parasites were not previously known. The conclusion is, then, as Morren well remarked respecting the former, that they must have been imported, and there is no more difficulty in this notion, nor indeed so much, as that of the introduction of such a quantity of white Clover seed into the tracts recovered from the sea. In every branch of natural history there are difficulties enough, and it would be surprising indeed if there were none where such minute productions are concerned. The reflective mind will often observe with combined wonder and admiration how the Almighty produces effects of great magnitude and importance, which are at the first view altogether incommensurate with the causes from whence they are derived.

## ORCHIDS FOR THE MILLION.—No. XIX.

By B. S. Williams, gr. to C. B. Warner, Esq. Hoddesdon.

Climate Hot and Damp.—Plants which are Grown in Baskets with Peat, or Moss and Potsherds.

*Coryanthes macrantha.*—This extraordinary plant comes from the Caraccas, and flowers in May and June, the lip is red, the rest of the flower orange-yellow, spotted with dull purple. It remains but three or four days in perfection. It will grow on a block, but thrives best in a basket, with moss and peat, and potsherds, broken very small. It should be suspended from that part of the roof where there is plenty of light and moisture in the growing season.

*Coryanthes speciosa.*—This is another singular Orchid, which comes from Demerara; it flowers in May and June, and remains but three or four days in bloom. It requires the same treatment as the former.

*Camarotis purpurea*, comes from Sylhet; it flowers from March to May, and lasts in bloom two or three weeks. This is best grown in a basket, with sphagnum, peat, and potsherds, suspended from the roof. In the growing season, it should have a good supply of heat and moisture; afterwards it may be kept rather dry.

*Houlletia Brocklehurstiana*, comes from Brazil; it flowers in October, and remains a long time in perfection. It does well in a basket with sphagnum, and peat, and potsherds, suspended from the roof, where there is a good supply of heat and moisture during the growing season; afterwards it may be kept rather dry.

*Oncidium Lanceanum.*—This fine species, from Surinam, will grow on a block, but it does best in a basket with sphagnum, peat, and broken potsherds, suspended from the roof, where it can have plenty of heat and moisture during the growing season; its flowers remain four or five weeks in perfection.

*Oncidium flexuosum.*—A very neat and handsome flowering species, from Brazil; the blossoms are yellow, slightly spotted with brown; it will last in bloom from four to five weeks.

*Oncidium flexuosum majus.*—This is much finer than the former one. It flowers in July, and remains long in perfection.

*Oncidium bifolium.*—An interesting species, from Monte Video; the labellum is large, and of a beautiful rich yellow, the sepals and petals being small and brownish; the flowers remain long in perfection. It will succeed on a block, but does best in a basket, with sphagnum, and peat, and potsherds, suspended from the roof, in a shady part of the house, where there is plenty of heat and moisture during the growing season; afterwards it may be kept rather dry.

*Oncidium longifolium*, from Mexico. The flowers are yellow, blotched with brown, and the labellum entirely yellow. It will remain two or three weeks in bloom. It will grow on a block; but it does best in a basket with moss, peat, and potsherds.

*Brassia maculata major*, from Jamaica, flowers in May and June; it remains long in perfection, and requires the same treatment as the last.

*Acineta Humboldti*, comes from La Guayra, and flowers in May and June. It grows well in moss and peat in a basket, suspended from the roof.

*Acineta Barkeri*, from Mexico, flowers in June and July. It will succeed on a block, but also does well in a basket with moss and peat, suspended from the roof, where it can receive a liberal supply of heat and moisture during the growing season; afterwards it should be kept rather dry.

*Angræcum caudatum*, comes from Sierra Leone, and flowers in July and August. The blossoms are of a greenish yellow, mixed with brown; the labellum is pure white, from which proceeds a tail about nine inches long, of a pale green colour. The flowers remain long in perfection. The plant succeeds well in a basket with moss, peat, and potsherds, suspended from the roof of the house, where there is plenty of heat and moisture during the growing season.

## BRITISH SONG BIRDS.

(Cage Birds, No. 33.)

No. XLIX.—Having now disposed of a variety of interesting matters, particularly relating to the season of autumn, and the time for the migration of our summer visitors, we will return anon to the consideration of the more weighty topics, as promised. Previous to this, however, we will resume the subject already introduced of a bird's early education.

The most remarkable instance I ever remember to have met with, of a young pupil not only imitating but far surpassing his tutor, was about nine years ago, in Jermyn-street, Haymarket. At that period, I revelled in the undisturbed enjoyment of a large aviary, numbering no fewer than 366 inhabitants, all first-rate songsters; and my fame as an amateur had spread widely. Among the multitude of my visitors was a gentleman, who informed me that a friend of his was possessed of a most wonderful bird, that he should much like me to see and hear. I took the address, and went at an early day to view the prodigy.

On entering the house referred to, and on presenting my card, I was at once ushered into the drawing-room. I there saw two cages—nightingale cages—suspended on the wall. One of them, with a nightingale in it, had an open front; the other had a green curtain drawn down over the front, concealing the inmate. After a little discourse on the subject of ornithology, my host asked me—if I should like to hear one of his nightingales sing? Of course, I was all expectation. Placing me beneath the cage, and drawing up the curtain before alluded to, the bird above, at a whistle from his master, broke out in a succession of strains that I never heard surpassed by *any* nightingale. They were indeed surprisingly eloquent. "*What* a nightingale!" ejaculated I.

The rapid utterance of the bird, his perfect *abandon* to the inspiration of his muse, and his indifference to all around him, caused me to involuntarily exclaim with Coleridge:—

"———*That* strain again!!
Full fain it would delay me."

And so it did. I stood riveted to the spot, knowing how seldom nightingales in a cage so deported themselves.

After listening some time, and expressing my astonishment at the long repeated efforts of the performer—so unusual, I asked to be allowed a sight of him. Permission was granted;—the curtain was raised, and I saw before me,—a *Robin!!* This bird had been brought up under the nightingale from his very earliest infancy; and not only equalled, but very far surpassed, his master in song. Indeed he put him down, and silenced him altogether. This identical bird, I should add, was sold a few weeks afterwards, for nine guineas—he was worth the money. In this case the robin retained no one single note of his own, whereby the finest ear could detect him; and this paves the way to still more singular discoveries hereafter.

The above is one curious fact out of very many others that I could cite, if necessary. All birds whose larynx is large, are capable of similar excellence. Even the house sparrow (Passer domesticus) has been known to rival and to surpass the canary in song. Indeed, if taken very young, and kept in the company of canaries only, he is one of the most apt and ready of pupils. This is no secret to the curious observer. The great difficulty in making these experiments exists in the impossibility, or impracticability, of getting a quiet room, where no other voices than those of master and pupil can be heard. Thus, many are reared in cellars, by gas-light; and kept there till "true" to their song. The "principle," however, is still good, let your birds be educated where they may.

The Hon. Daines Barrington, to whom, as a most valuable authority, I shall often have occasion to refer confirms my observations to the full. One, however, of his remarks, shall suffice for the present. Speaking of the education of young birds, he says, "I have educated nestling linnets under the three best singing larks; viz., the sky-lark, wood-lark, and the tit-lark. Every one of these, instead af adhering to the linnet's song, adhered *entirely* to that of their respective instructors." A very little reflection will show us how natural this is.

I have recently been asked to give my opinion, as to whether young birds, if confined in a cage, and allowed to hear no bird whatever sing to them,—would, or would not, themselves use the note peculiar to their parents? My reply to this question is,—that they would most assuredly "record" the song peculiar to their own tribe, *and none other;* under the circumstances stated. Gilbert White, in an experiment he made with some chaffinches (too long to quote here), sets this question quite at rest, nor can there be any reasonable doubt about it.

If we narrowly watch the ways of Nature in all these matters, our reward will be great. We shall find her on every occasion consistent with herself; and that so far from there being any one thing left to "chance," all is "well ordered and sure." It is only when we mortals interfere, with our (so called) "improvements," that we find "exceptions" from general rules. And in no case do we more offend against Nature's laws than in our "improvement" on the early education of the innocent little creatures about which we are now discoursing.—*William Kidd.*

## Home Correspondence.

*Flower Garden Plants.*—There are few things connected with gardening which require more, or receive less thoughtful attention than the management of flower garden plants, during the winter and spring months. The well-known fact of Verbenas and many other bedding plants being half hardy, has encouraged the idea of a slight protection, only, being necessary for their preservation from frost; and the only provision made to secure this has, in many places, been the erection of ranges of brick pits with glass lights; and as any means of applying artificial heat was considered unnecessary, none have been employed. As I have for several years watched the effect of this treatment, I will just describe what I have seen. About this time, or a little earlier, the cuttings are struck, after a while they are potted singly in small pots, and then placed in the pit, where they enjoy plenty of air and light. For a time they grow most vigorously, but then comes short days and frosty nights; a thick covering is now indispensable. Sometimes a day or two, occasionally a week passes without this covering being removed; when it is, the damp is found to be making sad havoc; a little air is given, which, with the feeble heat of the sun, causes the plants to flag; and well they may, for the soil in the pots is very dry, but no water can be given, it would so fearfully increase the dampness of the pit. The month of February is reached, mildew is spreading in all directions, and continues to do so, in spite of sulphur or any appliance whatever, until at last a third of the plants are found to be dead, and the remainder so much diseased, that half of them at bedding-out time are valueless; in consequence of this, the flower beds are so thinly planted that it is late in the summer before they are covered, and hence arises one of the principal objections to this mode of flower gardening. Now, considering the expense of building these pits, the space of ground they occupy, the cost of mats, the frequent breakage of glass, and the amount of labour involved in their management, with the unsatisfactory result of their use, it must, I think, be admitted that the contrivance is anything but a good one. This being my opinion, I have for the last three years ceased to store flower garden plants of any kind in pits, using in preference a small greenhouse. In this house (the dimensions of which I am unable to furnish, having now left the place), I had a trellis made nearly on a level with the bottom of the front lights, these being hung on hinges were capable of being raised by wedges to admit air, as circumstances might require; this trellis was filled with 5-inch pots, in each of which about 20 cuttings had previously been struck. Now, as 49 of these pots, containing together 980 plants, would stand upon each square yard of trellis, ample means were thus afforded of keeping an immense stock of Verbenas and plants of similar habits, independently of the stage, which was kept for Geraniums and Calceolarias. Under the stage I made a Mushroom bed, and under the trellis I placed, for rooting, the potted bulbs intended for winter forcing. My mode of treatment with the plants thus preserved, was to make the cuttings a little earlier in the season than this, choosing the points of short-jointed healthy shoots; to strike them in a close frame without heat, gradually harden and stop them, then fully expose them to the weather, when at all fine, till the middle of October, the time of housing. After this, I regularly dusted a little sulphur over them once a fortnight, brushing it well about the leaves, and attended very particularly to the watering; for I am convinced that nothing tends more to the increase of mildew and the injury of all plants in pots than dryness at the roots. By strict attention to these points, and by keeping the house both cool and airy, the plants made but little growth, and were always healthy and hardy. About the middle of February the points of all the shoots were taken off and struck in an early Vinery. Early in April all the Verbenas I had wintered were turned out of their pots, carefully separated, and planted deeply in the newly-dug flower beds at once; here, for about six weeks, they made no growth; I did not expect they would. Then why, it may be asked, were they planted so early? Because at that time they were very hardy, and I considered that the longer they remained in-doors the more tender they would become; besides, it made room on the trellis for the newly-struck cuttings, then in small pots, to grow and acquire strength, before they were planted out between the old ones, about the middle of May. By this method, the beds were always well filled, and the house (the like of which any builder could erect and heat for 50*l.*) was available for the cultivation of Fuchsias, and other plants for the conservatory, during the summer and autumn months. *W. Sherwood, Mr. Kendall's Nursery, Stoke Newington.*

*Rhododendron Dalhousiæ and Falconeri.*—Having grown these plants for some time in a late Vinery, I have since removed them to a cool Orchid-house, such as suits Lælias and Cattleyas. A very speedy and marked improvement has taken place in their appearance, and they promise to do well. Is not the plant distributed from Chiswick as Rhododendron cinnabarinum, R. Gibsoni? It does not resemble R. cinnabarinum of Dr. Hooker. It seems a very free grower, in an atmosphere which does not suit the other Himalaya species. What treatment best suits R. javanicum, especially in winter? I find it grows very strongly in a cool Orchid-house, and does not seem excited too soon by the warmth in spring, but it has not flowered with me as yet. Its foliage is remarkable for the enormous size of the stomata, which are visible to the naked eye, and thrips seem to have a special affection for it. *J. R.* [The plants are distributed from Chiswick with the names borne on the seed papers. Until they are older, it is impossible to determine them with accuracy.]

*Carrots and Onions.*—I am obliged to Mr. Steel for his article on Carrots and Lettuces, which appeared at p. 629; and, being interested in the matter, I beg to ask him a few questions respecting early Carrots. Like others, I have been in the habit of sowing Early Horn, and sometimes "Orange" Carrots on a warm, dry border, at times varying from the middle of August to the middle of September; and, in most cases, I have got very good plants for standing the winter, but they invariably run to seed in June. My first impression was, that the seeds might be old or unsuitable, especially as the Carrots never exhibited their proper colour even before they ran to seed, being so white and sticky, that they were useless for all purposes for which young Carrots are wanted. This state of things led me to be more careful another season in procuring good seed, and I saved some myself, and sowed it as above, but with

very little better success. Now I have followed this plan for several years, and have rarely got what could be called useful Carrots. Certainly they do to flavour soup, &c., with: but when young ones are wanted, I sow under glass in a hotbed in the end of January. These become Carrots both in taste and colour, while the autumn ones degenerate into something like what I imagine the original Carrot was before it was brought into cultivation. Now I should like to know if autumn sown Carrots at other places are in the same condition as those I complain of, if so, they cannot be of much use, except for the commonest purposes. While on this subject, I may mention that with me autumn-sown Onions are nearly as important a crop as the spring-sown ones; but these I sow some time between the 12th and 20th of August, and allow them to stand thick all winter. In March they are thinned, and a portion planted out on a well prepared piece of ground; they invariably do well. Taking them as a sample, they are not so uniform in shape as summer ones, but many of them are larger. I have sown several kinds with about the same result. I do not, however, like the one most commonly recommended in gardening works for the purpose, viz., the Tripoli. It is very coarse, and becomes open and scaly. The silver-skinned is, I believe, the hardiest; but it is small, and, for many purposes, not so valuable as some other sorts. It is scarcely necessary to remark that seeds sown at such an unnatural period as August and September ought to be good; and do not pinch quantity. I generally rinse the seed at that period, rejecting all that is doubtful. *An Old Gardener.*

*Oignon de Nocera.*—It is worthy of remark that the Onions produced from seed of this variety, received from the Horticultural Society this season, were attacked with a disease exactly similar to that described in your leading article at p. 595: not on the neck alone, but also on the bulbs. Other Onions in the vicinity, of a different sort, were not affected by the disease. *F. S.*

*Habits of Rooks* (see p. 629.)—The rooks, in a very large rookery within a quarter of a mile of me, always, except in breeding time, roost in a neighbouring wood. *Este.*

*The Maiden Hair Tree* (see p. 614.)—I beg to inform an "Occasional Tourist" that there are two very good specimens of Salisburia adiantifolia in the garden of the Duke of Beaufort, at Badminton. The largest measures 37 feet in height, 18 feet across the branches, and the bole (6 feet from the ground) is 3 feet 8 inches in circumference. This is the largest and finest tree of the kind I have ever seen. *J. T.*——I beg to say that there is a fine tree of Salisburia adiantifolia in the kitchen gardens of Earl Cowper, Panshanger, Herts. *Anon, Sept.* 27.

*Himalayan Vegetation.*—In your report of the proceedings of the British Association it is stated that Dr. Hooker had ascended the Himalaya to the height of 28,000 feet. This is assuredly the highest point ever attained by man. Some 25 or 30 years ago Gerard with great difficulty arrived at an elevation of about 20,000 feet in his futile attempt to reach Laduak, a city which at that period some fabulous reports had given interest to; but the line of perpetual snow was considerably below that point. I think also that Moorcroft by another route accomplished that object a year or two after; but to Webb and Gerard was assigned the merit of having determined the snow line to be much higher than geographers from analogy and other imperfect data had fixed it. The latter had attained an elevation of some few hundred feet above what Humboldt had previously accomplished on the Andes, and which was regarded as the highest point ever ascended by man. Pray does the "Review" of last week mean to say, that Dr. Hooker reached 28,000 feet or even 25,000 feet, or is that only given as the estimated height of the range in the quarter alluded to. Though, perhaps, not strictly within the province of the cultural subjects of a gardening periodical, this question is yet of importance to a class of inquiring minds, who occasionally step out of the beaten track to get a peep at some object in geographical science. The various grades of vegetation from the plains of India to the more elevated regions of Nepaul and Cashmere, have often been treated of, and, beyond the line of profitable cultivation, travellers have described the various families of shrubs diminishing in numbers as a greater height is attained, until only herbaceous plants appear, which again become lost, the limit of vegetation being some Lichens or mosses. Now has not some writer or traveller (which he ought to be) told us, that in some of the elevations of this remarkable range vegetation ceases entirely some considerable distance below the line of perpetual snow, the extreme dryness being such as to extinguish vegetable life, and therefore universal sterility prevails? I think, too, that Moorcroft describes a lake of considerable size at an elevation of some 18,000 feet, which, though receiving the waters of several large rivers, was completely land-locked, the extreme dryness of the atmosphere absorbing all superfluous water as quickly as it was supplied; and though the thermometer indicated an amount of cold many degrees below our freezing point, yet there was neither ice nor any appearance of frost. Now, as it is evident there must be a mistake in the 28,000 feet being attained by any traveller, pray tell us the highest point that has been reached by Europeans on that interesting range, and whether it has ever been exceeded by any similar ascent in the Western hemisphere. These matters are important for gardeners to know, for if we cannot imitate the rarity of the atmosphere which the plants we have from there enjoy in their natural habitats, we may at least glean a little information as to how to treat them in the altered circumstances in which they are placed in this country. *An Old Gardener.*

[You are mistaken in supposing that the *Gardeners' Chronicle*, in reporting the proceedings of the British Association, says that Dr. Hooker ascended the Himalaya chain to either 25,000 or 28,000 feet. The passage misquoted by our querist states that Dr. Hooker "describes the district of the Himalaya in which he travelled as reaching 28,000 feet, whilst that described by Captain Strachy was only 25,000 feet." The greatest elevation attained by man is, if we remember aright, 22,000, and some odd hundreds of feet—by one of the brothers Gerard, who, with a companion and excellent instruments, ascended Purgeool to that height. Purgeool is a mountain in Little Thibet, lat. 31° 50′; long. 78° 40′ E., having a total elevation of 22,600 feet. Humboldt, in his "Aspects of Nature," seems unaware of this ascent. Both brothers had previously ascended the same mountain to upwards of 19,000 feet, and a description of these ascents is given in "Gerard's Account of Kunawur," a work in which our correspondent will find most of the information he requires as to the limits of cultivation, and of the snow-line, and which, with Lloyd and Gerard's Travels, Moorcroft's do., and the works of Royle and Jacquemont, Vigne, Hugel, &c., we would recommend to his perusal. Various plants ascend to upwards of 18,000 feet in the Himalaya, both herbaceous and shrubby. Gramineæ, Cruciferæ, Compositæ, Ericeæ, Ranunculaceæ, and Cryptogamæ (Lichens chiefly), to 19,000. Cultivation of Barley reaches 14—15,000 ft., and Turnips or Radishes on very rare occasions to nearly 16,000. Pasturage may be found, in favoured localities, at 17—18,000 ft., but very scantily. The limit of perpetual snow varies with the humidity of the atmosphere and locality, &c., from 15,000 ft. to 20,000 ft. The position of the greatest amount, and of the lowest level of perpetual snow, does not coincide with that of the greatest elevation to which the mountain mass of the Himalaya rises, but with that of those lower spurs of the mountains, which, being nearest the plains of India (and consequently the ocean) attract and collect all the moisture that would otherwise fall on the much loftier land behind them, in Thibet. Vegetation follows much the same laws, and is hence more luxuriant close to the perpetual snows in the humid regions, where the latter descends to 15,000 ft., than in the arid, where both ascend above 19,000 ft. *H.*]

*Messrs. Wrench's Samples of Seeds.*—I beg to suggest that it might be interesting, and also useful, to the unlearned, if Messrs. Wrench were to sell collections of seeds, such as those exhibited by them, and mentioned in your last week's paper, at p. 634. *Tuesday.*

## Societies.

Horticultural, *Oct. 7.*—Mr. Glendinning in the chair. Sir E. B. Baker, Bart., Sir C. Ricketts, Bart., Sir J. Thorold, Bart., H. Wilson, Esq., and Major-General Fox, were elected Fellows. Messrs. Veitch received a Banksian Medal for a nice specimen of a yellow-flowered shrubby Calceolaria from Peru. Though not quite hardy, even in the climate of Devonshire, it was mentioned that it might be worth while wintering it under protection for the purpose of planting in the shrubbery in spring, where it would probably form a bush, some 2 or 3 feet high, and prove very ornamental in summer. The somewhat ample, shining, bright-green leaves, in which its value in part consists, will no doubt be looked upon with interest by the hybridist who is anxious to improve the foliage of some of the finer flowered kinds.—Messrs. Weeks sent a bloom of the Royal Water Lily (Victoria regia), a bud of Nymphæa cærulea, and a flower and a leaf of N. dentata, from the open heated pond in their nursery, in which such plants have been found to grow and flower successfully. The leaf of N. dentata was certainly as large and fine as it could well be in the best-managed stove aquarium. It was stated that the Victoria had produced 50 blooms in the course of the past summer, and that the plant was still unprotected. A Banksian Medal was awarded.—I. Anderson, Esq., of Maryfield, contributed cut specimens of a seedling Veronica, which, although pretty, was inferior in beauty to V. Andersonii, a charming hybrid, raised by the same gentleman. Mr. Frost, gr. to E. L. Betts, Esq., of Preston-hall, Aylesford, furnished a seedling Begonia, obtained by crossing B. cinnabarina with B. nitida. The result is a freer flowering plant than B. cinnabarina, with even higher coloured flowers than those of that fine kind, while the foliage is very nearly the same as that of nitida. A Certificate of Merit was awarded it.—Mr. Kennedy, of Covent-garden, sent a narrow-leaved variety of Scolopendrium officinale from Yorkshire.—Mr. Stark, of Edinburgh, sent a new purple and lilac-flowered Linaria, called arabida, which looked as if it would make a good rock plant. It was raised from Portuguese seeds collected by Dr. Welwitzsch in 1849.—Messrs. Jackson, of Kingston, sent half-a-dozen nicely-blossomed plants of Odontoglossum grande, which had been flowered in a cool house. It was mentioned that this is one of the hardiest of exotic Orchids, and that it has been even bloomed out of doors during summer under the shade of a Laurel bush.—Mr. Macintosh, nurseryman, Maida-vale, Edgeware-road, received a Certificate of Merit for a very large and fine shrubby specimen of common Mignonette. This was a single plant, pricked out in a small state into a pot last autumn, and shifted on till it had attained its present size. It was remarked that Mignonette is not an annual, as many imagine it to be; but that it will become a woody shrub, and last for years, provided it is well managed, and kept free from frost and damp.—Mr. Rivers, of Sawbridgeworth, contributed some Strawberry plants, illustrative of a new mode of preparing them for forcing. They were in 6-inch pots filled with two-thirds loam and one-third rotten dung. The novelty that attached to them consisted in beating these materials firmly into the pots before the runners were struck, with the view of giving the plants more food than they could possibly obtain under ordinary conditions. It was added that, from experiments he has made, Mr. Rivers entertains a very high opinion of compressed earth for many gardening purposes.—Mr. Fleming, gardener to the Duke of Sutherland at Trentham, furnished four Queen Pine-apples, whose weights were, respectively, 7¼ lbs., 6 lbs. 14 oz., 5 lbs. 15 oz., and 5 lbs. 10 oz. The heaviest, a remarkably fine fruit, was hardly ripe. A Banksian Medal was awarded. Mr. Jones, gr. to Sir J. Guest, Bart., received a Certificate for a Ripley Queen Pine, weighing 6 lbs. 3 oz.; and a similar award was made to Mr. Frost, of Dropmore, for a Black Jamaica, 5½ lbs. A Queen Pine, 5 lbs. 4 oz., was furnished by Mr. Fraser, gr. to the Earl of Radnor; and Mr. Brown, gr. to H. Minton, Esq., had a Ripley Queen weighing 4 lbs. 14 oz. Mr. Elphinstone, gr. to the Speaker, at Heckfield, received a Banksian Medal for bunches of Black Hamburgh Grapes, well swelled and ripened, though not very large, which were cut from Vines raised from eyes that were only struck on the 10th of February last. They were grown in pots, and one of the Vines taken from the pot was submitted to the inspection of the meeting. It was about 4 feet high, stout, and well ripened. It had been topped when about 15 inches high, and had afterwards thrown up a strong shoot which produced the fruit. The young plants—at first placed on a warm Vinery flue—were shifted in April and afterwards forwarded in a bed of leaves. They were topped when 4 feet high, and were shifted into their fruiting pots in May. A dish of Black Hamburgh Grapes was exhibited by Mr. Rust, gr. to J. Maclaren, Esq., of Ticehurst, Sussex; and examples of the same kind of Grape were furnished by Mr. Fry, gr. to Mrs. Dent, Manor House, Lee, Kent, with a view to prove the effect of sulphur in killing the Vine mildew, which has been so prevalent, both in this country and on the continent. When the disease first began to show itself in the Vinery, which it did both last year and this, the temperature was raised, and sulphur vivum was freely applied, by means of Fry's sulphurator. Under this treatment, the mildew disappeared, both from the leaves and fruit, in the course of four or five days. The Vines were afterwards cleared of the sulphur, by syringing them with clean water, through a fine-rosed syringe.—A punnet of round white seedling Potatoes were shown by Mr. Wilmer, of Sunbury. It was reported to be very early and prolific.—From the Garden of the Society came two Orchids, various Achimenes, Tillandsia amœna, a variety of the Japan Anemone, the white Lilium Wallichianum, a Cape Heath, the useful Lyperia pinnatifida, the Siebold Sedum, Torenia asiatica, and Cyrtoceras reflexum, together with fruit of the Late Admirable Peach, Coe's Golden-drop Plum, Gravenstein, and Mère de Ménage Apples, Belle et Bonne and Double Phillips' Pears, and a dish of Black Prince Grapes. The latter were sent to show that Grapes may be kept free from mildew by early and repeated sulphuring over both leaves and fruit. The Grapes were quite free from any smell or appearance of sulphur, although they were stated to have been covered with it the day before the meeting. It may be removed either by plunging the bunch in a vessel of clean water or by syringing it on all sides in a downward direction through a fine-rosed syringe. The garden also furnished a large yellow Gourd weighing 136½ lbs.; specimens of a yellow-striped Mushroom shaped Squash, and a French "sulphurator." The great merit of the latter is its simplicity and cheapness. It consists of a tin box for holding the sulphur, placed on the upper side of the pipe of a pair of common bellows. The sulphur gets into the pipe through small holes made for the purpose in the bottom of the box, and, in order that no stoppage may take place, a small hammer head attached at the end of a slight steel spring is fixed on the under side of the bellows, a gentle tap from which, now and then, keeps up a continuous fall of sulphur into the pipe. These appliances, which may be attached to a pair of bellows for little more than 6*d.*, answer every purpose for which they are intended, equally as well as a more expensive machine.

## Notices of Books.

*The Geological Observer.* By Sir Henry De la Beche, C.B. 8vo, pp. 846; with numerous woodcuts. Longmans.

We scarcely need say that one of the most judicious and successful living investigators of geological phenomena is the present Director-General of the geological survey of the United Kingdom, and author of the work before us. Standing aloof from cabinet speculation, and *à priori* hypotheses, Sir Henry De la Beche has passed his life in the field, examining and classifying facts, and comparing them diligently, until safe conclusions can be formed. The "Geological Observer" may therefore be taken to represent the author himself, expounding the principles which long experience has led him to adopt; and pointing out, from a vast collection of evidence, the grounds upon which his principles are founded.

The work is therefore eminently practical, and will be employed to most advantage by those who have the opportunities of study in the field. "Here, indeed," Sir Henry declares, "is the great source of geological knowledge; however important the cabinet, in its place, may also be. It is there that the observer learns to appreciate the greater problems of geology, and where he may himself so materially assist in obtaining correct views of the modifications which the earth's surface has undergone in past times, and of the causes tending to obliterate its present condition."

The work treats of pure geology only, excluding mineralogy. That is to say, it includes an excellent account of the causes, or supposed causes, which have produced the actual condition of the crust of the earth; but it excludes all details concerning the nature of the mineral and other substances of which the crust is composed. It therefore stands in the same relation to mineralogy as a treatise on physiology would to an account of the genera and species of plants and animals. The subjects themselves are discussed in the following order. 1. Decomposition of rocks and formation of soils; 2. Action of water; 3. Result of that action in forming lacustrine deposits, coast formations, and tidal accumulations; 4. Chemical deposits, bogs, and reefs; 5. Action of ice, icebergs, glaciers, &c.; 6. Caves; 7. Volcanoes and lava inundations; 8. Earthquakes; 9. Rise and subsidence of land; 10. Temperature of the earth; 11. Mode of accumulating rocks, and formation of beds; 12. Igneous rocks, their bending, contortion, and dislocation; 13. Accumulation of metallic substances; 14. And the denudation of rocks.

Our limits preclude extracts; nor indeed could they be made advantageously, so entirely do the several parts of Sir Henry de la Beche's book depend on each other. We, therefore, content ourselves with referring the reader to the work itself, which is abundantly illustrated with good and useful woodcuts, and has a tolerably full index.

## FLORICULTURE.

Awards at Floricultural Exhibitions. — As Societies are now arranging their schedules for next season, it may be well to mention that wherever competition exists with greatest warmth, there is sure to be found that judicious regulation (framed by the late Metropolitan Society) of rewarding at least two-thirds the number of stands staged, and so graduating the value of the prizes, that a small per centage shall alone separate the first from the second, or the 18th from the 19th, as the case may be; the battle is for place, and not for profit. A silver cup fails to induce that display which its cost, judiciously offered, is certain to effect. Taunton, Southampton, Camberwell, Thornbury, have all failed this season in gathering numbers, compared with those at Notting-hill, Highgate, Stoke Newington, Salisbury, Shacklewell, and Slough, &c., localities in which it is universally known the two-third system prevails. Does not this afford a practical lesson, which it would be well for committees and councils to commit to memory? What flower annually maintains the amount of patronage that is bestowed on the Dahlia? Even the Carnation and Picotee fall short, popular though they be. Shall we live to see the day when our summer exhibition tables will give quarters to whole armies of Pelargoniums? A plant infinitely less expensive to cultivate than autumn's king. A few square feet of glass enables the Pelargonium grower to give place and shelter to those marvellous masses of bloom familiar to all who visit our metropolitan exhibitions. How they are produced, few as yet understand; while for Dahlias whole acres are often devoted to their cultivation. But to effect any revolution in flower showing, our warning is, multiply the number of prizes, and lessen the fall in value from first to second, and from second to third, and reward at least two-thirds of the collections staged; then we shall have occasion to remark Pelargoniums for the million, and their production not confined to some three or four, the extent to which their cultivation has for years been limited. *J. E.*

Amateur Tulip Society.—The investigation of the alleged case of non-compliance with the rules on the part of one of the exhibitors, took place on Monday last. The evidence failed to show that any malpractices had been resorted to, and the prize money was tendered to the party, who immediately refused to accept it, and desired that it should be made a gift to the funds of the Gardeners' Benevolent Institution, at the same time withdrawing his name from the lists of the society. The candidate referred to in our last week's notice, seeing the way in which matters were managed, also declined becoming a member, and therefore the ballot for his election was stopped.

Stoke Newington Chrysanthemum Society. — A preliminary meeting will be held at the Society's Rooms, on Thursday, the 16th inst., at 8 o'clock, in order to make the necessary preparations relative to the forthcoming exhibition. *J. E.*

Chesterfield Dahlia Society, *Sept.* 9.—The following are the awards: — 1st Pan of 12 Blooms: Mr. Slack, with Queen of Sheba, Scarlet Gem, Snowflake, Shylock, Elizabeth, Cleopatra, Mrs. Seldon, Fearless, Duke of Wellington, Standard of Perfection, Morgan's King of Dahlias, and Queen of the Isles; 2d, Mr. Barlow, gr. to R. Stephenson, Esq., with Mr. Seldon, Richard Cobden, Beeswing, Berryer, Crocus, Marchioness of Cornwallis, Princess Radziville, Duke of Wellington, Shylock, Magnificent, Sir F. Bathurst, and Queen of Sheba. 1st Pan of 6 Blooms: Mr. Morley, with Essex Triumph, Beeswing, Mr. Seldon, Shylock, Duke of Wellington, and Queen of Yellows; 2d, Mr. E. Morley, with Duke of Wellington, Princess Radziville, Shylock, Mrs. Anderson, Sir F. Bathurst, and Crocus; 3d, Mr. Auckland, with Princess Radziville, Duke of Wellington, Shylock, Sir F. Bathurst, Marchioness of Cornwallis, and Fearless. Classes: A Premier Prize, for the Best Flower in the Classes (given by Mr. Towndrow), was won by Mr. Slack, gr. to E. G. Mayhard, Esq., with Fearless. Dark Class: 1, Mr. Haslam, with Louis Philippe; 2, Mr. Marsden, with Berryer; 3, Mr. Slack, with Admiral Stopford; 4, Mr. Marsden, with Black Eagle; 5, Mr. Slack, with Richard Cobden; 6, Mr. Barlow, with Louis Philippe; 7, Mr. Marsden, with Black Eagle; 8, Mr. Marsden, with Essex Triumph. Crimson Class: 1, Mr. Marsden, with Sir F. Bathurst; 2, Mr. Slack, with Sir F. Bathurst; 3, Mr. Marsden, with Standard of Perfection; 4, Mr. Slack, with Beeswing; 5, Mr. Marsden, with Captain Warner; 6, Mr. Auckland, with Napoleon; 7, Mr. Slack, with Sir Edmund Antrobus; 8, Mr. Marsden, with Morgan's King of Dahlias. Yellow Class: 1, Mr. Slack, with Cleopatra; 2, Mr. Slack, with Crocus; 3, Mr. Slack, with Yellow Standard; 4, Mr. Marsden, with George Glenny; 5, Mr. Slack, with Seedling; 6, Mr. Morley, with Queen of Yellows; 7, Mr. Morley, with Duke of Newcastle; 8, Mr. Morley, with Seedling. Scarlet Class: 1, Mr. Slack, with Shylock; 2, Mr. Marsden, with Shylock; 3, Mr. Morley, with Shylock; 4, Mr. Morley, with Nonpareil; 5, Mr. Slack, with Scarlet Unique; 6, Mr. Auckland, with John Edwards; 7, Mr. Auckland, with Scarlet Gem; 8, Mr. Slack, with Seedling. Orange Class: 1, Mr. Slack, with Duke of Wellington; 2, Mr. Marsden, with Duke of Wellington; 3, Mr. Marsden, with Seraph; 4, Mr. Bacon, with Biondetta; 5, Mr. Marsden, with Toison d'Or; 6, Mr. Marsden, with Earl of Clarendon; 7, Mr. Barlow, with Golden Fleece; 8, Mr. Slack, with Seedling. Blush and White Class: 1, Mr. Slack, with Queen of Sheba; 2, Mr. Marsden, with Queen of the East; 3, Mr. Slack, with Marchioness of Cornwallis; 4, Mr. Barlow, with Queen of Sheba; 5, Mr. Slack, with Snowflake; 6, Mr. Bacon, with Antagonist; 7, Mr. Barlow, with Snowball; 8, Mr. Slack, with Eliza Cook. Tipped Class: 1, Mr. Slack, with Attractive; 2, Mr. Marsden, with Elizabeth; 3, Mr. Slack, with Jenny Lind; 4, Mr. Slack, with Bragg's Star; 5, Mr. Marsden, with Beauty Supreme; 6, Mr. Slack, with Beauty of Hastings; 7, Mr. Slack, with Delight; 8, Mr. Barlow, with Lady Granville. Lilac and Rose Class: 1, Mr. Slack, with Fearless; 2, Mr. Slack, with Fearless; 3, Mr. Marsden, with Mrs. Anderson; 4, Mr. Slack, with Mrs. Shelley; 5, Mr. Morley, with Duke of Cambridge; 6, Mr. Morley, with Elizabeth; 7, Mr. Auckland, with Fame; 8, Mr. Haslam, with Adonis.

Cornwall Royal Horticultural, *Sept.* 9.—Nice collections of florist flowers, as well as of plants and of fruits, were contributed on this occasion. The 1st prize for the best six Fuchsias, consisting of Elegantissima, Kossuth, Orion, Diadem of Flora, Sir J. Falstaff, and Beauty of Stortford, was awarded to Mr. F. H. Earle, Falmouth; 2d (Gem of the South, Gem of the West, Crimson Expansa, Beauty of Leeds, Lord Nelson, and Ignea), Mr. Friend; 3d (Acantha, Crimson Expansa, Gem of the West, Unique, Rosa Quintal, and Ne Plus Ultra), Mr. G. N. Simmons. Best Fuchsia specimen (Purity), Mr. G. N. Simmons; 2d (Gem of the South), Mr. Friend. Best 12 Dahlias (Snowflake, Magnificent, Grenadier, Golden Drop, Fame, Duke of Wellington, Sir Francis Bathurst, Lord Clarendon, Fearless, Cornish Gem, Hector, and Mr. Seldon), Mr. G. Williams; 2d (Duke of Wellington, Grenadier, George Glenny, Mr. Seldon, Cornish Gem, Snowflake, Sir F. Bathurst, Athlete, Beauty of Hastings, Hector, Yellow Standard, and Gasperine), Mr. M. H. Williams; 3d (Purple Standard, Toison d'Or, Mr. Seldon, Duke of Wellington, Captain Warner, Sir E. Antrobus, Elizabeth, Beeswing, Sure-Enough, Florence, Dombey, Princess Alice, and Admiral Stopford), Mr. Friend; 4th (Duke of Wellington, Sir E. Antrobus, Fearless, Snowflake, Seraph, Mr. Seldon, Admiral Stopford, Beauty of Hastings, Marquis of Worcester, Lord Clarendon, Hector, and Beeswing), Mr. M. Williams. Best six ditto (Snowflake, Grenadier, Duke of Wellington, Cornish Gem, Mr. Seldon, and George Glenny), Mr. G. Williams; 2d (Mr. Seldon, Snowflake, Cornish Gem, Grenadier, Beauty of Hastings, and Duke of Wellington), Mr. M. H. Williams; 3d (Marchioness Cornwallis, Duke of Wellington, Captain Warner, Box, Gasperine, and Sir E. Antrobus), Mr. Daubuz; 4th (Beeswing, Captain, Duke of Wellington, Toison d'Or, Purple Standard, and Mr. Seldon), Mr. Friend. Best Roses in pots (La Reine, Devoniensis, Red China, &c.), Mrs. G. C. Fox; 2d (Lady of the Lake, Odorata, Souvenir de la Malmaison, Bougère, &c.), Mr. G. N. Simmons. Best collection of Cut Roses (Souvenir de la Malmaison, Mrs. Elliott, William Jesse, Duchess of Sutherland, Count Robinsky, Queen, Du Petit Thouars, Devoniensis, &c.), Mr. G. Williams; 2d (Souvenir de la Malmaison, Baronne Prevost, Queen, Géant des Battailles, Comte de Paris, &c.), Mr. M. H. Williams. Best Verbenas (Iphigene, Vulcan Superb, Defiance, Lady of the Lake, St. Margaret), Mr. G. N. Simmons.

Cumberland Floral and Horticultural, *Sept.* 16. — Twenty-four Dahlias, Dissimilar Blooms: 1st, Mr. Geddes, gr. to G. Mould, Esq., with Beeswing, Sir F. Bathurst, Mrs. Seldon, Standard of Perfection, Yellow Standard, Mr. Seldon, Purple Standard, Mr. Cobden, Admiration, Lord Mayor, Fearless, Duke of Wellington, Crocus, Capt. Warner, Grenadier, Lady Leicester, Mynn, Princess Radziville, and Scarlet Gem; 2d, Mr. Carruthers, gr. to J. Dixon, Esq. 12 Varieties: 1st, Mr. Geddes, with Beeswing, Box, Capt. Warner, Crocus, Yellow Standard, Mrs. Seldon, Mr. Seldon, Duke of Wellington, Shylock, Sir E. Antrobus, Sir F. Bathurst, and Violet Perfection; 2d, Mr. Carruthers. Six Sorts: 1st, Mr. Geddes, with Beeswing, Sir F. Bathurst, Mr. Seldon, Mrs. Seldon, Fearless, and Shylock. 12 Edged, Tipped, or Shaded: 1st, Mr. Geddes, with Admiration, Boule de Feu, Conspicua, Marchioness of Cornwallis, Princess Radziville, Queen of England, Queen of the Isles, Rainbow, Star, Beauty of Sussex, Mary Jane, Beauty of Hastings, and Turner's Beauty; 2d, Mr. M'Intyre. Six Edged, Tipped, or Shaded: 1st, Mr. Geddes, with Princess Radziville, Turner's Beauty, Admiration, Queen of England, Marquis of Worcester, and Star. 12 Border or Fancy Kinds: 1st, Mr. M'Intyre, with General Cavaignac, Rainbow, Lady Cullen, Jeanette, Empereur de Maroc, Comte de Flandre, Lady Granville, Floral Beauty, Adolphe Dubras, Elizabeth, Madame Wachy, and Miss Stevens. Six Border or Fancy Kinds: 1st, Mr. Geddes, with Empereur de Maroc, Miss Compton, Lady Granville, Rainbow, Lady Cullen, and Jeanette. Three Maroon or Crimson: 1st, Mr. Geddes, with Sir F. Bathurst. Three Scarlet: 1st, Mr. Geddes, with Shylock. Three Rose or Pink: 1st, Mr. Geddes, with Rose d'Amour. Three Lilac: 1st, Mr. Geddes, with Fearless. Three Orange or Buff: 1st, Mr. Geddes, with the Duke of Wellington. Three White: 1st, Mr. Potts, with Antagonist. Three Yellow: 1st, Mr. Potts, with Cleopatra. Six Verbenas: 1st, Mr. Geddes, with Defiance, St. Margaret's, Magnificent, Princess Alice, Boule de Niege, and Heloise. Six Antirrhinums: 1st, Mr. Geddes, with Masterpiece, Snowflake, Crimson King, Delicatissimum, Beauty of Carlisle, and Admiration. In addition to the above, there was an interesting exhibition of plants and fruits.

Scottish Pansy, *Sept.* 2.—The seventh annual Committee Meeting of this Society was held at Falkirk, for the purpose of examining the merits of seedlings raised by members in 1851. There was a numerous display of new flowers, evincing a growing determination to bring the Pansy to the highest state of perfection. The committee awarded first-class certificates to four flowers, three of which were produced by Messrs. Dickson and Co., Edinburgh, and the other by Mr. Finlayson, of Kincardine. "Count de Flahault" (Finlayson), a yellow ground flower, with dark maroon belt and top petals, large, and of a rich velvety texture, very fine form and smooth outline, will be a fine show flower. "Sovereign" (Dickson and Co.), a yellow self, with large and very dark blotch in centre. "Etna" (Dickson and Co.), also a yellow self, with a beautiful blotch of deep maroon; on comparing these with the best of the class (yellow self) in cultivation, they were unanimously considered far superior. "Miss Talbot" (Dickson and Co.), a pure white ground flower, with deep purple belting and top petals, blotch large and dark, fine form and texture. There was another flower, named "Miriam," in Dickson and Co.'s stands particularly noticed, and doubtless very fine, but being in bad condition, the committee delayed giving a decisive opinion of it till seen in a good state. There were a number of seedlings sent by Mr. Wilkinson, Arbroath, but unfortunately so much injured in carriage that no decided opinion could be given. One variety in Mr. Whamond's collection, named "Jane," attracted the particular notice of the committee, and which they unanimously recommended to be brought forward again. Amongst other flowers forwarded by Mr. Gowanlock, of Perth, but also much injured in carriage through post, there was a white ground flower with bluish purple belting and top petals; the committee were of opinion, that had this flower been in good condition, it would, doubtless, rank amongst the finest of its class, and they strongly recommended that it should be brought forward on a future occasion. The eighth grand annual competition of the Society will be held in Glasgow, in June, 1852, of which due notice will be given.—*North British Agriculturist.*

FLORISTS' FLOWERS.

Calceolaria: *Watford.* The office of the *Gardeners' Chronicle* is 5, Upper Wellington-street, Covent Garden; *not* 21, Regent-street.

Dahlias: *J Brimmer.* We at once recognised your fancy flower, Admiration, and can only repeat our description of it, given at page 675. Colour, deepest maroon, with white tips.—*Lector*, and others. Please excuse a week's delay.

Gloxinia; *W T.* Apparently no improvement on red kinds already in cultivation.

Fuchsia: *G M.* Vigorous in habit, bold and free, but deficient in many essentials that make up a first-rate flower.—*J M.* A nice border variety, with a good habit.

Pansy: *E A Mc.* A flower remarkably dark and uniform in colour; deficient in outline.

Verbena: *W T.* A nice white kind worth preserving.

## Miscellaneous.

*Microscopes of the late Professor Link.*—Two excellent microscopes, used by Professor Link for preparing his representations of the microscopical anatomy of plants, are to be sold at Berlin. One of these instruments was constructed by the celebrated optician, Plössl, of Vienna. It has five ocular and six object-glasses, and magnifies by the first ocular from 25 to 210 times, and by the last 1145 times. A revolving micrometer, of excellent workmanship, and measuring with the greatest precision, a large prism and a large lens mounted on separate statives, both for illuminating, and various other implements, are added. The instrument cost altogether about 45*l.* The lenses are in no way injured, nor the screws worn out. The other instrument is a catadioptric microscope, by Professor Amici, of Florence, the discoverer of the pollen-tubes going down to the ovules. It is excellent for its achromatism and its large field of view. There is a fine prism for refracting objects. It has four ocular, and five object-lenses. Its magnifying power reaches from 21 to 1558 times, or with the first ocular to 286 times. The object-lenses, separately mounted, are also used either alone or altogether as a simplex. The object-table slides up and down, and is furnished with a turning diaphragm and two revolving micrometers, the one moving from side to side, the other forward and backward. Two different kinds of camera lucida, and various other implements, especially for illuminating and excluding the false light, are added. This instrument has been but little used. Its price is said to have been about 45*l.* Offers will be received by Dr. Pritzel, Berlin, Alexandrinen-strasse, 88. *Hooker's Journal of Botany.*

*Sale of Orchids.*—The collection of the late Earl of Derby was sold by auction, by Mr. Stevens, at Knowsley Hall, on the 4th inst. The kind of prices they realised is as follows: Saccolabium Blumei, guttatum, and papillosum, 16*l.*; Vanda Roxburghi, cærulea, violacea, and some other kind, 16*l.*; Cattleya Mossiæ, Skinneri, crispa, and granulosa, 13*l.* 10*s.*; Dendrobium Dalhousieanum, calceolare, Pierardi, and cærulescens, 9*l.* 10*s.*; Catasetum (two plants), Cyrtochilum Bictonense, and Cypripedium Lowei, 8*l.*; Oncidium Papilio, ensatum, Cavendishii, and longifolium, 6*l.*; Phalænopsis amabilis, Peristeria elata, and longiscapa, 6*l.* 15*s.*; Odontoglossum grande, citrosmum, and pulchellum, 5*l.* 15*s.*; Miltonia candida, spectabilis, and Myanthus barbatus, 4*l.* 4*s.*; Lælia anceps, autumnalis, and two other sorts, 4*l.* 15*s.*; Sobralia macrantha and Schomburgkia tibicinis, 4*l.*; Angræcum apiculatum and Anguloa Ruckeri, 3*l.* 3*s.*; an Aspasia and Barkeria spectabilis, 3*l.* 15*s.*; Aerides (various species), from 1*l.* to 4*l.* 5*s.*; other lots, of which there were in all 124, fetched from 1*l.* to 2*l.* 10*s.*

*Gardeners' Benevolent Institution.* — We understand that Mr. Charles Dickens has consented to preside at the anniversary dinner in aid of the funds of this Institution, to be held next year, on the Monday after the June Chiswick Show.

## Calendar of Operations.

*(For the ensuing week.)*

PLANT DEPARTMENT.

Conservatory.—Use fire heat as little as possible, and only in conjunction with a free circulation of air. Thin out and regulate the pendent shoots of climbers, so as to admit the light to the plants below; but it is not necessary to make the wires bare and naked all at once, as, by retaining a few shoots, a more cheerful appearance will be given to the house during winter, without depriving the plants of light; and in spring, just before they begin to break, they may be pruned more closely. The shoots which are to be left during winter should be thoroughly cleared of insects. The house in which the principal display of flowering plants is made, should be kept sufficiently warm, to prevent any injury to those plants which have been brought forward in heat; avoiding draughts of cold air, but allowing sufficient

ventilation to prevent damp condensing about the flowers. The necessary amount of air should be given by partially opening every side ventilator, and every moveable sash also, unless in rainy weather. This is much better than admitting sweeping volumes of cold air by opening only a few of the ventilators to a greater extent. PITS AND FRAMES.—Forcing of plants into flower will now occupy a portion of these ranges, where a considerable display is required during the two last months of the year. In all cases let the excitement be very gradual at first, and by means of bottom heat keep the roots a little in advance of the tops. If the Hyacinths were potted at the time and in the manner recommended, they will now have filled the pots with roots, and a portion of them may be taken up and plunged where there is a slight bottom heat; but unless wanted very early, let it be very moderate, and accompanied by a free admission of top air. Encourage Mignonette with manure water, and remove any flowers which can be spared, to give greater strength to the plants.

### FORCING DEPARTMENT.

PINERIES.—Where the plants are now swelling their fruit, the temperature should be well kept up, and the plants may still with advantage be supplied with liquid manure. Succession plants should be subjected to a gradual hardening process, not so as suddenly to check or prevent their growth, but to reduce its rate by gradually lowering the night temperature, and admitting as much air during the day as the strength of sunlight will allow. The heat, however, during this month, should not be permitted to fall below 60° in the morning. VINERIES.—In applying fire heat to drive damp out of those houses where ripe Grapes are hanging, let it always be accompanied by air, or it will defeat the end aimed at, and even then it must be very moderate, or the Grapes will soon begin to shrivel. It is a nice point to steer between the two extremes, but if it be desired to preserve the fruit in good condition till January or February, no care or trouble must be considered too much. If any Vines have been prepared in pots or boxes for early forcing, a portion of them should now be pruned and well washed; at the same time any exhausted soil from the surface should be scraped off, and replaced by a top dressing of rich loam and dung. The plants should then be introduced into a forcing house or pit, with a temperature of about 50°, which must be gradually increased at the rate of 3° or 4° in a week. If the pots can be plunged in a bed about 15° hotter than the temperature of the house, it will be a decided advantage, as the roots will be thereby kept in advance of the tops. Let the plants be syringed once or twice every five days; and if a quantity of fermenting material can be introduced, the exhalation arising therefrom will considerably assist the development of the buds. PEACH-HOUSES.—The later forced houses will now be ready for cleaning and retraining, in the manner formerly described. This work should be done as soon as possible, that it may not interfere with the out-of-doors training, which should be commenced next month. FORCING PITS.—Rhubarb, Seakale, and Asparagus should now be in progress. The two former may be managed very well in any place possessing the characteristics of a Mushroom-house, namely, moderate warmth and exclusion of light. For Asparagus, a pit or bed should be prepared, furnished with bottom heat by dung or hot-water pipes. Light and air are necessary to this crop to render it fit for use. Nothing can be more absurd than blanching it, by which its flavour as well as its appearance is destroyed.

### FLOWER GARDEN AND SHRUBBERIES.

The general taking up of choice half-hardy plants should be proceeded with. There are thousands of plants, which, if taken up and potted in autumn, would prove invaluable in the following season, from their producing a greater amount of bloom than young plants; but few have much room for keeping them during winter in suitable places. Geraniums are amongst the most useful of the flower garden plants which deserve this care, and are, perhaps, the most easily managed. Unless very large specimens are wanted for next year, let the sides of the plants be pruned in, so that the pots may stand close together. All flowers should be removed; but with the exception of side pruning, every healthy leaf should be preserved until the plants are established in the new soil, after which, they may be cut down to any convenient height.

### HARDY FRUIT GARDEN.

Let the different varieties of Apples and Pears be carefully gathered as they ripen, and labelled. The shelves on which they are laid should be quite clean and dry, and the atmosphere of the fruit room kept perfectly sweet by allowing a free current of air to enter below, and pass through the roof, thereby carrying away with it all the exhalations which, if allowed to stagnate within the room, would materially injure the keeping qualities of the fruit. In storing the fruit, let all inferior or damaged ones be carefully picked out, laying them aside for immediate use; if this be not attended to, such fruit will soon begin to decay, and if not immediately detected, will be liable to communicate the disease to their neighbours. The fruit room should be cool and dry, and provided with means for preventing excessive changes of temperature; it should be provided with efficient means for excluding frost, either by shutters or curtains to the windows. When its situation happens to be near a plant-house, or early forcing-house, heated by means of a boiler, a small hot water pipe properly supplied with stop taps may be carried round the room; this would ensure the exclusion of the frost, and in very wet weather would be useful to drive out the damp. Shelves are preferable to drawers for keeping fruit in during winter, as it is more easily examined, and any that is beginning to decay can be removed without injuring that which is still sound. When drawers are used it is scarcely possible to avoid considerable injury to the fruit every time they are moved, as it is inevitably rolled and rubbed about, thus causing it to become spotted and unsightly, and at the same time hastening its decay. If the planting or removing of any fruit trees is contemplated this autumn, preparation should be made for the purpose as early as possible, that the work may be completed immediately after the leaves begin to fall. If this is attended to the trees will feel their way into the new soil this season. If any new trees are wanted from the nurseries, it is advisable to order them immediately, that they may be amongst the earliest selections from the nurserymen's stock.

### KITCHEN GARDEN.

Let the autumn-sown Onions, Cabbages, Cauliflowers, and Lettuces, be protected from the ravages of snails, by dusting them with lime and soot. The smallest of the Cauliflowers not planted in hand-lights, should be planted in a cold frame, where they can be protected from frost. Cold frames and covers for them should be immediately prepared, and filled with Endive and Lettuce, for winter and early spring. Let the ground beneath the frames be well drained, and a layer of coal ashes placed below the soil, which will help to keep it dry, and prevent the upward progress of slugs, &c. A soil consisting of charred loam and leaf-mould, which should be moderately dry and free from insects, is best for this purpose. The plants should be lifted from the border with good balls, and transferred to the frame, taking care not to break or injure the leaves. The latest crop of Cabbage Lettuce, intended to stand during winter, and come in for early spring use, should be planted in the driest, warmest, and most sheltered border, as it is an object of no small importance to secure a supply of this favourite salad. In very severe weather, they may be protected by Fir boughs. For the protection of winter salads, as Endives, Lettuces, and late Radishes, and for preserving Cauliflower plants during winter, light wooden shutters will exclude frost better than glass sashes and wet mats; and as they are much less expensive, are in every way preferable. Light can be admitted by tilting the shutters at the back during rainy weather, and by removing them entirely when it is dry, without being frosty.

State of the Weather near London, for the week ending Oct. 9, 1851, as observed at the Horticultural Garden, Chiswick.

| Oct. | Month's Age. | Barometer. Max. | Barometer. Min. | Temperature. Of the Air. Max. | Min. | Mean | Of the Earth. 1 foot deep. | 2 feet deep. | Wind | Rain. |

The highest temperature during the above period occurred on the 14th, 1845—therm. 76 deg.; and the lowest on the 18th, 1843, and 15th, 1850—therm. 24 deg.

## Notices to Correspondents.

BIRDS. Such of our correspondents (nine in number) as have given us their names and addresses in full, either *have* been written to BY POST, or will be at an early moment. Many others, not replied to, shall receive prompt attention when the above requisite particulars are furnished. The Inquiries made are, many of them, of a generally-interesting character; but the space that must necessarily be occupied in replying to them—how succinct soever the Answers might be—would encroach unduly on the columns of a newspaper. This has *already* become obvious. We beg again emphatically to remark, that *all* letters requiring *an answer* MUST contain a postage stamp, to frank them back to the writers. If WE furnish "brains" and time—the latter a serious sacrifice—it will be conceded that *our* half of the proposed compact has been efficiently performed. *W. K.*—THE YELLOW CHAFFINCH: *Ann T.* Very curious, the detail very pleasing. To your question, we reply, "In a few weeks." *W. K.*—THE DISEASED CANARY: *H T.* When you send your name and address, do not omit the "two specimen feathers." *said* to be enclosed in your letter, but found wanting. *W. K.*

BOOKS: *C K.* Beck's Treatise on the Pelargonium. ‡

DOMAIN: *Scoticus.* We should say that in England this word signifies, *in common parlance*, a considerable territory. It would not be applied to a few fields, but to a considerable tract of country. The derivation of the word shows that it must have originally signified the land surrounding the residence of the lord of the soil—a castle, for instance—and hence it may now be used in Ireland for a park or any other small holding; but we think the familiar application of the word is limited in England in the manner first described.

EMIGRATION: *Beta.* We cannot undertake so serious a responsibility as that of advising persons upon the countries to which they should go. They must judge for themselves. Books are to be had for a few shillings through any country bookseller, giving ample information, far beyond anything that a newspaper can find room for. All we can say is, do not go to South Africa or to Western Australia. We should go to Nelson, in New Zealand, or to British North America; but, observe, we do not advise you to do so. You must judge for yourself.

FRAMES: *J B H.* The best aspect for a cold frame is north-west. Nothing in which it is safe to soak Peas will prevent mice eating them. The best way is to cover them an inch deep in the drills with fine chopped Furze, and then to cover them with earth.

FRUIT TREES: *Cavanensis.* Eighteen sorts of Apples, chiefly for kitchen use, to be planted as espaliers, may consist of the following:—Four Dumelow's Seedling, Beauty of Kent, Alfriston, two Mère de Ménage, Golden Noble, Bedfordshire Foundling, Hawthornden, two Blenheim Pippins, Court of Wick, Court-pendu Plat, two Ribston Pippins, and Golden Reinette. Pears: Williams' Bon Chrétien and Louise Bonne (of Jersey).‖

GALVANISED IRON HOUSES: *R H C.* It would be unsafe to pronounce a decided opinion upon them without trial. We do not anticipate any advantage from them, but we may be wrong (see p. 499 of this year's *Gardeners' Chronicle*). The sashes glazed without putty have nothing to do with galvanising, and are mentioned at the same place. We recommend Hartley's rough plate glass for all purposes.

GRAPES: *J C.* Your seedling Grape resembles a well-ripened Early White Malvasia or Grove-end Sweetwater, and is quite equal to it in flavour.‖

INSECTS: *A B A I.* We found no insects on your Fuchsia leaves. If they are attacked by the aphides or red spiders, the best plan is to fumigate them with tobacco-smoke, placing them in a cotton cover or bag to retain the smoke. *W.*—*G E.* The caterpillar found on dwarf Roses on the sand-banks near Swansea, are those of the fox moth (Lasiocampa Rubi). They are very difficult to rear, especially so late in the season. *W.*—*J H.* The caterpillar found on the twigs of Abies Douglasii is that of the peppered moth (Biston Betularius). Its connection with the Abies is only accidental, and its peculiar attitude is that of the caterpillars of all the family, which are termed geometers, or loopers. *W.*

JACOBÆA LILY: *Beaminster.* The bulbs are perfectly hardy, but they will not flower without a season of drought. The late Dean of Manchester found them succeed well in Yorkshire against the wall of a stove in the open ground, flowering in the spring, and sometimes again in autumn. It likes a rich soil. The bulbs may also be advantageously planted out in spring, and taken up and dried on the approach of winter.

JUDAS TREE: *Mrs Cox.* A tree of this kind, with its peculiar roots, cannot be removed with certainty by the usual methods. But you may manage it thus: Ascertain at what distance from the main stem the roots are as thick as the little finger. From that place dig a circular trench round the tree, going deep enough to cut through all the side roots. Let the trench be 2 feet wide. When this has been done, fill the trench again with the same earth mixed well with leaf-mould. Next year you may safely remove the tree thus prepared, *as soon as the leaves have fallen*, not sooner.

NAMES OF FRUITS: *A G.* 1, Hollandbury; 2, Margil; 3, Fearn's Pippin; 4, Stagg's Nonpareil; 5, Cockle Pippin; 6, Court of Wick; 7, Golden Reinette; 8, 9, Scarlet Nonpareil; 10, Herefordshire Pearmain; 11, Royal Russet; 12, 13, Hughes's Golden Pippin; 15, Alexander; 16, King of the Pippins.‖—*Sub.* Apples and Pears wrapped in leaves: 1, Dutch Mignonne; 4, Wormsley Pippin; 7, 8, King of the Pippins; 11, Cluster Golden Pippin; 12, Alfriston; 13, Braddick's Nonpareil; 14, Gravenstein; 15, Cockle Pippin; 17, Lemon Pippin; 18, Northern Greening; 19, Sam Young; 22, Alexander; 23, Blenheim Pippin; 24, Red Quarrenden; 27, Dumelow's Seedling; 29, Hormead Pearmain; 30, Dumelow's Seedling; 31, Reinette du Canada. 1, Beurré Diel; 2, Doyenné Blanc; 3, Glout Morceau; 5, Passe Colmar; 7, Beurré Bosc; 8, Sucré Vert; 11, 20, King Edward's; 11, Fondante d'Automne; 13, Marie Louise; 17, 21, Easter Beurré; 18, 23, Glout Morceau; 21, Swan's Egg; 25, St. Germain.‖

NAMES OF PLANTS: *A S, Dundee.* 1, some Bromelia, indeterminable from such materials; 2, Asclepias curassavica.—*D H B.* 1, Polypodium Dryopteris; 2, Polystichum Lonchitis; 3, Lastrea spinulosa; 4, Lomaria spicant. You should attach the numbers in a way in which they can be conveniently seen. It takes more time in untying to find them, than to name the specimens. *S.*—*Erzeroum.* 259, Glaux maritima; 873, Androsace alpina; 40, 26, Androsace; 63, Androsace Bocconi; 681, Primula altaica; 90, Primula macrocalyx; 355, Lysimachia vulgaris; 15, Primula auriculata; 48, Iris caucasica; 2, I. reticulata.—*Heterosmithius.* 1, Solanum furcatum; 2, Stemodia palustris; 3, Salvia clinopodioides; 4, Chætosus, near volubilis; 5, Habenaria densiflora; 6, Hedyotis stylosa. We cannot again undertake the labour of naming dried specimens of the Herbarium.—*Green.* Spiræa laxiflora, and Cratægus cordifolia.—*Evelyn.* Viburnum Lentago and Cornus mas.—*X Y Z.* Abies nobilis, Juniperus recurva, and Biota chinensis.—*P K.* Cassia corymbosa.—*J P, Trentham.* We do not see in what way this differs from the dark crimson variety of Pentstemon angustifolius.—*G T N.* The Box-leaved Myrile, and a plant which cannot be identified for want of flowers.—*F L S.* The Snake nut is Ophiocaryon, not Ophiocarpon, *i. e.*, Snake *nut*, not Snake *fruit* (καρυα, a nut.)—*C K.* Bulbs not in flower cannot be named.—*P N Don.* Sesamum indicum, the common Sesame plant.

OAK LEAVES: *A R C.* The beautiful appearances are galls produced by the puncture of an insect—some species of Diplolepis.

PAWLOWNIA: *Vectis.* Permit us to congratulate you upon being the first to flower this plant in England. The specimens are blossom-buds, which are always born in the autumn and brought to maturity in the ensuing summer. They are perfectly hardy, and require no protection, even in the most severe weather.—*Gallicus.* It may be propagated by cuttings.

STRAWBERRIES: *C P.* The proper classification of Strawberries is that of botanists: 1, Wood; 2, Hautbois; 3, Americans. All belong to one or the other; the scarlet and its many varieties to the last.—*C K.* If the pots are full of roots, the plants may receive a larger shift now. Winter them on their sides, so that the plants may not become too wet, and if you can cover the pots with something so much the better. ‡

TREES: *W.* The height to be attained is unknown; it is understood to form a large tree. The two names are synonymous.

WALLS: *L M N.* It is unimportant how many inches the stone coping for a south brick wall for fruit trees—Peaches, Plums, and Pears—should project beyond the south face of the wall; 6 inches are sufficient. Neither is there any absolute rule to meet the following case: "If the fruit border be 12 feet wide, soil dark brown (no peat, no clay), on a porous gravel (limestone); climate, a wet and cold part of Yorkshire, how many inches in the yard should the border slope towards the south?" A difference of a foot between the front and back levels would throw off surface water fast enough; but a difference of 18 inches would perhaps be better, because of the greater exposure of the border to the sun in summer.

VERONICAS: *Edinensis.* We fear that this variety will prove by no means such a favourite as V. Andersonii. It wants the charming mixture of violet and white which renders the latter so beautiful. The specimens had nearly fallen to pieces, though admirably packed.

WHEAT: *C K D.* You shall hear of the hybrids in due time, but we must not anticipate the report of the jurors. Count Odart's work is entitled "Ampélographie Universelle, ou Traité des Cépages," &c., and is published in Paris by Dusacq, Rue Jacob, No. 26; or at Tours, by Cousturier.

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS, AS THE ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

THE LONDON MANURE COMPANY beg to offer PERUVIAN GUANO, warranted perfectly genuine; Superphosphate of Lime, Wheat Manure, Concentrated Urate, Irish Peat Charcoal, Gypsum, Nitrate of Soda, and every artificial Manure, on the best terms. Also a constant supply of Salt for Agricultural purposes, at a low rate. English and Foreign Linseed Cake, Rape Cake, &c.

EDWARD PURSER, Secretary, Bridge-street, Blackfriars.

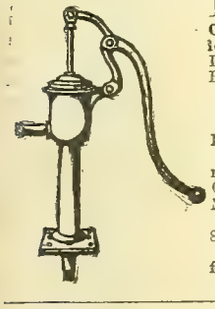
MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek:

| | |
|---|---|
| Clover Manure, per ton ... ... ... ... | £11 0 0 |
| Turnip Manure, do. ... ... ... ... | 7 0 0 |
| Superphosphate of Lime ... ... ... | 7 0 0 |
| Sulphuric Acid and Coprolites ... ... | 5 0 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per ton, in dock. Sulphate of Ammonia, &c.

ARTIFICIAL MANURES.—Private instructions in Chemical Analysis and the most approved methods of making Artificial Manures are given by J. C. NESBIT, F.C.S., F.G.S., at the Laboratories, Scientific School, 38, Kennington-lane, London.



Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much Improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description; but to those who have not seen them in operation, prospectuses will be forwarded, as well as references of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the Kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

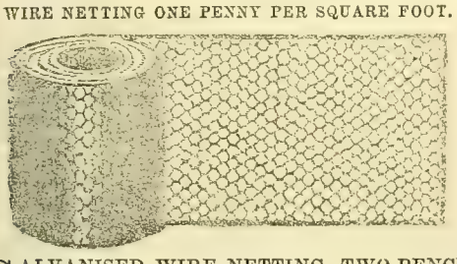
Conservatories, &c., of Iron or Wood, erected on the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

FARM AND COTTAGE PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

| | |
|---|---|
| Patent Pump ... ... | £1 16 0 |
| Patent Pump, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing ... ... ... | 2 12 0 |

Larger sizes if required.



May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers.

JOHN WARNER & SONS, 8, Crescent, Jewin-street, London.

Every description of Machinery for Raising Water, Fire Engines, &c.

The usual allowance to the Trade.

WIRE NETTING ONE PENNY PER SQUARE FOOT.

GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

| | | | |
|---|---|---|---|
| 12 inches wide | 3d. per yard. | 30 inches wide | 7½d. per yard. |
| 18 " " | 4½d. " | 36 " " | 9d. " |
| 14 " " | 6d. " | 48 " " | 1s. " |

Galvanised do., 1d. per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1s. 6d. per running yard; if galvanised, 2s. Also every description of Wire Nursery and Fireguards. Wire House-lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1s. 10d. per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6d. per running foot; Flower Trainers, from 3d. each; Garden Arches, 20s. each. Flower Stands, from 3s. 9d. each; Galvanised Tying Wire for Plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 44, Skinner-street, Snow-hill, London.

KESSINGLAND WHEAT.—Persons desirous of cultivating this productive and new variety of Wheat, can obtain it by applying to WILLIAM GRIFFIN, Eydon, Daventry, who is sending it out in small quantities at 6s. per bushel, including bags. Orders accompanied by post-office orders will be punctually attended to.

SMITHFIELD CLUB, 1851.—CHRISTMAS FAT CATTLE SHOW.—Prize Sheets and Blank printed Forms of Certificates may now be obtained, on application to the Honorary Secretary.

The last day for receiving Entries is SATURDAY, THE 15TH NOVEMBER, 1851.

THE ANNIVERSARY DINNER of the CLUB will take place at the FREEMASONS' TAVERN on the WEDNESDAY of the Show Week, instead of the Friday, as heretofore.

B. T. BRANDRETH GIBBS, Hon. Sec.,
Corner of Half Moon-street, Piccadilly, London.

COCHIN CHINA POULTRY.—A few young Birds of this fine and prolific breed, warranted quite pure, for sale. The Pullets are of a cinnamon colour, the Cock Birds of a lighter or darker bay.—For particulars, apply, enclosing stamp, to Mr. HENRY COPLAND, Chelmsford, Essex, who will feel pleasure in showing his Birds to amateurs and others.

PURVEYOR TO HER MAJESTY, H.R.H. PRINCE ALBERT, AND THE KING OF THE NETHERLANDS.

JOHN BAILY, 113, Mount-street, Grosvenor-square, London, Dealer in all sorts of USEFUL AND ORNAMENTAL POULTRY; Domesticated Wild Fowl; Gold, Silver, and common Pheasant Eggs for Hatching; all sorts of Fancy Fowls' Eggs, large Aylesbury Ducks, &c.

BAILY'S registered PHEASANT AND POULTRY FOUNTAINS, by which Birds are ensured a supply of clean and wholesome water, and the lives of thousands of Chickens and Pheasant Poults saved—14 quarts, 17s. 6d.; 7 quarts, 15s. 6d; 3 quarts, 13s. 6d. Drawings and particulars forwarded by post on application.

BAILY'S "Hints for the Management and Fatting of the Dorking Fowls for the Table," price 1s. 6d.

The Agricultural Gazette.

*SATURDAY, OCTOBER* 11, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
THURSDAY, Oct. 16—Agricultural Imp. Soc. of Ireland.
THURSDAY, — 23—Agricultural Imp. Soc. of Ireland.

THE INDUSTRIAL EXHIBITION has this day closed.

For nearly half a year a series of illustrated lectures, as it may well be called, has been maintained in constant and surpassing interest before an audience such, for numbers and for composition—in a building, such for size and structure—as the world had never seen. Assemblages such as had rarely met before, except for deadly fight, have joined to receive the lesson of mutual regard and good will. Nations which had hitherto considered one another "natural enemies" have taken their first step in the nobler rivalry of industry, intelligence, and skill; and the philanthropy which dictated the whole affair has itself received a mighty impulse, without swallowing up the lesser sentiments of patriotism in the separate sections of the human family; for that too has been strengthened by the labours and the honours which each has given and received.

Classes which had hitherto looked somewhat suspiciously, it may be, and unkindly, on one another, now know each other better: they have seen the common and the distinguishing excellencies which each exhibit. The wealthy have done homage in their hearts to the wondrous skill of the artificer: the labourer has seen how much he can accomplish when employed by the capital of the wealthy: the landlord and his tenantry—the farmer and his labourers—the manufacturer and the mechanic—the tradesman and his customers—all, for once, have been united in the healthy sentiment of admiration of disinterestedness and skill: and all, without exception, have united in grateful admiration of those beside and on the throne, in whom the virtue of this mighty exhibition has originated, and in whom the truest sympathy with its design exists.—God bless the QUEEN—say millions who have seen how thoroughly her Majesty has entered into all the pleasures of her subjects, sympathised in all their labours, enjoyed the witness of their skill; and, "Long live PRINCE ALBERT," say all who write for the advancement of the British nation or the general progress of mankind: for, surely, never yet was any single effort made so successful for the good of both, as that of which his Royal Highness occasioned the beginning, and this day sees the end.

We are the stronger as a nation for the Industrial Exhibition, in the loyalty and patriotism which it has aroused. Who is not proud of being an Englishman? An English Prince conceived the idea of the Industrial Exhibition—an Englishman designed the Crystal Palace, in which it should be held—Englishmen erected that stupendous edifice at three months' notice—Englishmen have astounded all the world with the wonder of the machinery department, and many other divisions of the spectacle inside. Englishmen have conducted the labours of a congress of the nations to a most successful end. And mankind in general, as well, most certainly, have also made a great step in advance. Who will assert that the good feeling among nations—the friendship between France and England, for example—which this Exhibition has occasioned, has not brought us all a long stage onwards on that journey which is to end in universal peace.

It is, however, to a more limited or sectional view of this great subject that we would, if we had room, at present guide our reader. We would inquire what standing our agricultural exhibitors obtain among the others in the Crystal Palace; how far they have contributed their share to the contents of the Great Museum? whether agriculturists have rivalled members of the other trades and occupations in that disinterested, laborious, and almost self-sacrificing energy, which is certainly the most extraordinary of all the many exhibitions there displayed. The answer to such an enquiry is, we fear, humiliating. The machinery of our different manufactures is exhibited with tolerably equal energy; indeed, our agricultural machine-makers have been educated by the English Agricultural Society into such a pitch of active competition, that the machinery of the manufacture of food has been probably exhibited on a larger scale than that of any other; but the exhibition of the products of our different manufacturers is miserably uneven. There are woollen goods and linen goods, and silks and calicoes, abundantly; there is hardware in abundance and porcelain, and many dozen other manufactures of less importance are exhibited; but the products of the food manufacture—the most important of them all—are hardly to be seen. The colonies in this respect have beat the mother-country. It is not of the quality but the quantity exhibited that we speak. Australian Wheat may well be better than that grown in England; we have not got the sunshine of Australia. But that was not a reason why the products of our agriculture should not be shown in *quantity;* at least enough to indicate their character and kind.

On this, however, we must not enlarge at present. Late, and even altogether past the time, as it may seem, we shall hereafter notice in succession such of the agricultural productions of this and other countries as have been shown; name such specimens as deserved particular attention, and do honour to those individuals who have rescued the agricultural body from the disgrace of having had no share at all in the great event of the current century.

WE are happy to inform our readers that Mr. ALCOCK has caught an idea. The hon. member for East Surrey has discovered a panacea for agricultural difficulty, and if he can but have his own way, Wheat may sink to 30s. without the farmer knowing it. He would not have protection if he could. If JOHN BULL were resolved to restore it in the shape of a 5s. duty, he, Mr. ALCOCK, would not "condescend to accept this paltry, trumpery sum." "What man," shouted the hon. gentleman at Epsom the other day, "would be so base, and shabby, and pitiful, as to accept such a thing, to break through the magnificent principle of free trade." "Do you suppose I should be satisfied to have this humbugging amount of 50l. a-year on 400 acres of land? Not at all, not at all; I should—*I would* have a repeal of the malt-tax; I say, I would ask for liberty *to do what I liked*—to grow what I liked on my own land—to grow Flax, or Beet-root, or Tobacco, as I pleased myself—and do you think you should gag me and humbug me with this nonsense of a 5s. duty? Do you think I am ass enough to be humbugged by your 50l. a-year? (A laugh.) No, I would do nothing of the sort at all. I would have this, if I can, with your assistance, or *without your assistance; I will have* guano at 5l. a-ton, and I'll have liberty to make brandy or spirit, or what I pleased, of my Barley or my Beet-root. Who is going to tell me that we are to have free-trade, but you shall not make spirit, or steep Barley, *or grow Tobacco?*" Away with your protection, away with your duties, your sliding scale, your re-distribution of burthens, your evasion of local burthens; give me guano at 5l. a ton, and the British lion will defy the world. Guano is the thing, and the only thing for our salvation.

Bravo! One cheer more for the honourable member for East Surrey—who *will* have guano for nothing, and *will* do what he likes with his own. Surely we must here have the real mysterious PAUL FOSKETT; at all events Mr. ALCOCK is resolved to Foskettise the Peruvian Government if they won't sell guano in England for the cost of freight and agency. But why does he not call upon the Bank of England to sell him a sovereign for 10s.? What right has the Bank to insist upon 20s. for every one of their gold tokens? it would be a great relief to the agricultural interest if the Bank would lower the price of gold *to them* by one-half; and it is a monstrous iniquity that it won't. Such a rascally corporation deserves annihilation.

We wonder that nobody should have asked the

honourable gentleman why he does not let his land for half its value, swearing that farmers were not "such asses as to be humbugged" by a paltry reduction of 10 per cent. on rents, but would have 50 per cent. off.

Suppose this had happened; suppose that in addition some vehement tenant farmer had started up, exclaiming in the words reported to have been employed by Mr. Alcock, "I am not going to be ruined if I can help it. I have not the slightest idea of having my property destroyed. I have not a halfpenny in the world beyond land in England; I depend upon it solely, totally, and without any equivocation whatever; and do you think I will, with my eyes open, allow that interest to be carried away, and lost to me and to yourselves, if I can help it?" and then had added, that the only way in which he and others could be saved was by compelling the British Government to compound with the national creditors for 10s. in the pound. What, we say, would Mr. Alcock have replied to that? And yet it would not have been more unreasonable than his own wild harangue.

The scheme for securing agricultural prosperity by reducing, by main force, the price of guano from 9*l.* to 5*l.*, is so absurd that we should not have noticed it, had the proposal originated with a person of inferior station to a member of the House of Commons and a representative of an English county. Mr. Alcock argues that, if farmers would refrain from using guano, the Peruvian Government would be compelled to sell it at half price. Another man might as well argue that, if people would refrain from eating meat, the grazier would be compelled to sell his beef and mutton at half price.

But would the proposed measure have the effect anticipated? Certainly not. We are not the only customers of the Peruvians. Vast quantities of guano go elsewhere. And the truth is, Peru can better afford to lose us, than we to lose Peru. We *must* have guano, and that, thanks to the hubbub created by Mr. Alcock, is too well known on the shores of the Pacific. The effect of this preposterous clamour is far more likely to be an advance than an abatement of the price; and on this ground, as well as that of the otherwise suicidal doctrines which Mr. Alcock continues to advance, we once more protest against his proceedings.

Cannot the honourable gentleman perceive to what his principles immediately tend? Or is he prepared to follow in the course of the old buccaneers?

---

One of the most remarkable of the agricultural incidents of the present season has been the sudden appearance of the Turnip caterpillar over the whole island, and the havock which it has made on one of our most valuable crops. It is impossible to say how far the general crop may be affected, but it is certain that the loss on particular farms has been very great. It seems that Mr. Bruce, who resides in the south of Ireland, has suffered severely, but can still look forward to a similar visitation with comparative indifference, as he intends to starve the insects out by pulling up the Swedes as soon as they make their appearance, and then sowing Purple-top Yellow in their place; but, as he justly observes, this remedy will only be applicable when late sowing can be practised. He relates a curious instance of the devouring scourge eating the Purple-top Turnips at the rate of 11 to 12 yards a day across the drills in a field, where they cleared the ground before them as they issued from the side where Mangold was growing. In this particular case we think that these voracious devourers might have been met on their own ground by their natural enemies with great effect. For our own part we would rather recommend Turnip growers to be prepared by next season with an army of very useful and apparently most efficient antagonists, than to deprive the caterpillar of the means of existence, for the first chance of a Turnip crop is always the best one. We would advise a trial of the same means which were used by the late Lord Leicester in 1784, to clear his Turnip fields of the pest. In the 2d volume of the "Annals of Agriculture," Arthur Young writes, "Mr. Coke having heard that ducks had been used in small patches of Turnips in gardens to eat the caterpillar, called the black canker, determined, on a field of 33 acres of Turnips being attacked by that pernicious animal, to try how far they might be depended upon on a large scale. He ordered his bailiff to buy all the ducks he could get, who presently collected 400; on the 16th July they were turned into the 33 acres, having water at one corner of the field, and in five days they cleared the whole most completely, marching at last through the field on the hunt, eyeing the leaves on both sides with great care to devour every one they could see, and filling their crops several times in a day. The ducks having saved above 60*l.* worth of Turnips, were sent to the poultry yards. We should imagine ducks might be allowed 15 days for doing this work, in which case 400 ducks would secure 100 acres. Upon such a proportion 20 or 30 might be employed on a small farm to great effect. *R.*

---

## MANURES.—No. IV.

Flesh is rarely employed as a manure, except in the case of a dead horse or the refuse of the shambles, when such remains ought to be mixed with earth, as they fertilise a large quantity of matter. Dry flesh leaves 23 lbs. of animal matter. Blood is more largely employed as a manure than flesh, being used in extensive quantities as it comes from the slaughtering houses. In France it is dried, and in a state of powder dusted over the crops, but the better way is to make it into a compost. It consists of the same elements as flesh, and strange to say, in nearly identical proportions; there are found in blood fibrin or muscle, which is analogous with the gluten of vegetables; albumen (albumen, white of egg) similar to that found in vegetables, which preserves wood when combined with a metallic salt. Blood when cold coagulates or thickens; divides into a liquid and solid part; the former called serum, abounding in albumen, which, from its absorptive power of impurities, is used for clarifying or refining sugar; this explains why bullock's blood is employed in the refining of sugar, and the just value attached to the refuse of sugar refineries. Dry blood leaves 4·43 per cent. of ash, rich in the phosphates of soda, lime, and magnesia. Skin is more frequently used in the preparation of glue; the parings of the hides, as they come from the tan-yard, when applied to loamy soils, at the rate of 35 bushels (a bushel costs 6*d.*), should be well covered in the ground, or the effluvia from their decay will attract crows, which will root up the ground, as in the case of bones and seaweed—in searching for worms. In cold or temperate climates, the bodies of sheep are covered with a curled, and closely-matted kind of hair, called *wool*; owing to its roughness and curly form, when manufactured into cloth it thickens in the milling, and forms a close texture—hair will neither thicken nor form any texture. These are the distinguishing features. Woollen rags are well adapted for light and chalky soils, owing to their retaining much moisture, on account of which property they are well suited for Hops: cut into pieces, rags can be applied at the rate of 5 to 9 cwt., either to Wheat, Clover, or Turnips; from their slow fermentive tendency, they should be applied some time previous to sowing a crop, so as to have their fertilising action brought out; scatter them over the soil and cover them with the last ploughing, so as the harrows cannot drag them up. Rags are rich in nitrogen, containing more than blood—they contain 1-20th of their weight of sulphur. In the United Kingdom the wool crop abstracts from the soil five million pounds of sulphur annually, to restore which to the soil, 13,000 tons of gypsum would be required.

Clippings, or Cony-dust, is a substance procured from the waste particles of wool or fur, and mixed up with the clippings of the rabbit skins from off which the fur is taken. It is employed in Lincoln at the rate of 18 bushels, in the raising of Turnips on light soils. Like wool, it is deficient in inorganic matter, and its success, as a manure, may be attributed to the nitrogen and animal secretions contained in it.

Hair is very seldom, almost never, employed in this country as a manure, but it can be purchased at the tan-yards of Belfast for 5*l.* per ton. In China, it is more extensively employed.

Horn is procured, for agricultural purposes, from the parings of that substance in the manufacture of thin plates for lanthorns when the latter are rendered semi-transparent; horn being the first transparent substance used for lantherns and windows. It is similar in composition with wool, and, like it, decays slowly in the soil, in consequence of containing little water—water being a chief agent in promoting decay, probably from the facility with which it yields up its own elements to induce the formation of new compounds.

Refuse of Sugar Refineries is the skimmings of the sugar during the process of refining, which process is effected by the albumen contained in the bullock's blood; a substitute for blood, consisting of gelatinous alumina and gypsum, has of late in this country been employed; hence, the reason why the refuse charcoal is frequently poor in blood. The refuse should be broken into small lumps, mixed with road scrapings, and applied at the rate of 25 tons to cold adhesive soils. It is largely used in France, its value being estimated in proportion to the quantity of blood contained in it.

Fish, where met with in large quantities, is employed as a manure; its efficacy being equal to the bones or flesh of land animals. Thus the bones of an ox contain 64½ per cent. of earthy matter, and 35½ of gelatine;* while those of fish contain 67 per cent. of the former, and 32⅔ of the latter. The inorganic matter consists of phosphate and carbonate of lime. Again, the amount of nitrogen found in salmon and mutton is the same, 12¼ per cent., while that of the skate contains 15¼, and beef 14. Off the coasts of Cornwall and Devon the pilchard, somewhat resembling the herring, and from 8 to 10 inches in length, appears in July in shoals, and is caught in large quantities; 30,000 hogsheads being sent to market annually. Sprats are of the herring tribe—in length from 3 to 5 inches—caught in immense numbers off the British coast, at Yarmouth, and in the Bristol Channel particularly; 30 barrels of them have been known to be taken in a single haul. The refuse of herrings form a considerable source of fish manure; 14 barrels of herrings yielding one of refuse. How great the supply must be, when at Yarmouth the "mart" of the herring trade, 60,000 barrels are annually cured! Our ancestors were ignorant of the mode of "curing" this fish, and it was not till the end of the 14th century, when a native of Brabant made the discovery, for which he was honoured 160 years afterwards by Emperor Charles V., who paid a visit to this benefactor's burial place, and weeping ate a herring on his tomb. In the fens of Lincoln and Cambridge small fish abound in such swarms that they are netted and sold for manure. Whales killed in the northern seas are cut up into large pieces, packed in the vessel until its return home, when the oil is extracted (train oil it is called) by boiling; what remains is called blubber. The fat of the whale preserves its body from putrefaction, and shields it from cold. Fish refuse, whether obtained from blubber, sprats, the entrails and heads of cod and ling from the curing station should be made into layers with old sods, earth, or bog mould, commencing with a layer of earth, two feet in thickness, next a layer of fish, one foot thick, alternating the materials. The compost is thus to remain for two months, when it should be turned, its parts intimately mixed; and at the end of eight months, previously giving the heap two additional turnings, applied at the rate of 27 tons per acre to all crops and all soils.

Fish Oil has been recommended as a manure; I have as yet seen no satisfactory proofs of its efficacy; nor am I inclined to expect such, seeing that oil is but carbon united with the elements of water.

Bones.—Nature uses the salts of lime for the framework of animals. The use of bones as a manure was known in England since 1776; but it was only within the last 29 years that they were employed extensively. Large quantities were imported into Hull from the continent; in the former place machinery was erected for their comminution, and the crushed mass sold out to the farmers of York and Lincoln; and from the successful application of bones to the Turnip crop, they were gradually looked upon as something more than a manure subsidiary to the farm-yard. Previous to machinery being discovered for reducing bones to a state of comparative fineness, the bones were burned, for the sake of their ash, which was called "bone earth;" or when burned in close vessels the residue was called animal charcoal or bone black. By each of these methods the organic matter was lost. Other times they were mixed with quick-lime, strewed in the bottom of dung-pits, and there decomposed by the ammoniacal salts in the urine. Again we find them broken by hammers, from which, as great discoveries spring from insignificant causes, may have led to the invention of machinery to abridge labour; a more general faith in the efficacy of bones led to greater trials of them for manuring purposes, experience taught their immediate action was greater when applied to the soil in a finely divided state, and science corroborated the fact. Bones are crushed by passing through a series of rollers with deeply indented rims, each underlying set having the teeth more closely fitted, until the inch and half-inch standards are reached. The "*dust*" is formed by screening out the finer from the more closely ground particles. *Libra.*

* Gelatine exists in the skins, cartilage, and membranes; gives toughness to the bones; phosphate of lime strength. Nearly half the bones of an ox is gelatine; it is largely found in the bones of young animals, hence, they are more easily broken. The weakness of fish bones arises from an excess of gelatine; bones will retain their shape and appearance, when their earthy salts are dissolved out by a mineral acid, but will become soft; hence the flexibility of bones, when dissolved in oil of vitriol. Gelatine is found in glue, isinglass, and parchment; and in skins, united with tartaric acid, it forms leather.

---

## ON THE CULTURE OF PARSNIPS.

The profitable growth of Parsnips requires a soil of deep, rich, warm loam, which may be very much fitted for their use, and for that of all tap-rooted plants, by the operation of subsoil ploughing the land, and deepening the staple. The rotted farm-yard dung is laid on the stubble in the end of autumn, and ploughed under with a deep furrow. In the early spring, the land is moved lengthwise and crosswise, by two operations of a close-tined grubber, which pulverises the soil, and raises the weeds to the surface, which are picked by hand, and removed. The seeds of the Parsnips are then sown in March, on the flat ground, by a drill machine with lengthened coulters, which make ruts for receiving the seeds at the distance of 18 inches, and are covered by a bush-harrow. When the plants are grown 3 or 4 inches high, they are singled by the hand-hoe to the distance of 1 foot from each other, and during summer the intervals of the drills are scarified, and the rows weeded and properly thinned. In this condition the crop grows till the time of storing, which is not early, as the roots are not easily hurt by frost. In the end of October, or in November, the roots are deprived by hand sickle of the top and fibres, and laid in store at the homestead. The tops are given to store pigs in the open yard, where part is eaten, and the refuse converted into manure.

For horses, the use of Parsnips is not applied; for swine, the roots are highly beneficial, either in a raw or steamed condition; and for feeding cattle, the use is very much recommended. Milch cows fed with Parsnips give much milk, and yield a butter that is very well flavoured. The roots are best in a steamed condition, and mixed with chaff in the vats, by which process the chaff is impregnated with the juices of the roots that are expelled by the heat, and which would otherwise be lost. This preparation forms a very agreeable and juicy

food for cows, and is very greedily eaten by the animals, which do well upon the food in all respects. The steamed roots are best prepared for swine in being mashed and mixed with meals, and given to the animals in troughs in a lukewarm condition. Raw Parsnips are very nutritious to store pigs in the open yards.

The cultivation of Parsnips is mostly confined to the Channel Islands, and some favourable spots in Kent. The plant indispensably requires an early, warm climate, and dry soils of the first quality of sandy loam. The average produce of an acre of Parsnips is 12 tons, which are compared, as below, with the average acreable weight of Potatoes in 8 tons :

| 12 tons (26,880 lbs.) Parsnips contain: | lbs. | 8 tons (17,920 lbs.) Potatoes contain: | lbs. |
|---|---|---|---|
| Water ... ... .... | 21,543 | Water ... ... ... | 14,228 |
| Organic unazotic ... | 4,642 | Organic unazotic ... | 3,054 |
| Protein compounds ... | 561 | Protein compounds ... | 414 |
| Ashes ... ... ... | 333 | Ashes ... ... ... | 294 |

This statement may be too favourable to the Parsnip, but it is confirmed by the following particulars :—

| | In 100 parts of Parsnips. | Potatoes. | |
|---|---|---|---|
| Water ... ... ... ... ... | 79.4 | 75.5 | |
| Starch and fibre ... ... ... | 6.9 | 19.0 | |
| Gum ... ... ... ... ... | 6.1 | 6.8 | fattening. |
| Sugar ... ... ... ... ... | 5.5 | 3.3 | |
| Albumen ... ... ... ... ... | 2.1 | 1.4 | fleshening. |

The fattening quality of sugar is well known, and generally acknowledged. Bullocks fresh in condition from the summer's feeding on Clover or good Grass, are put in the feeding stalls about the 1st of October, where they have three meals, daily, of roots, sliced lengthwise, and hay is given between each meal of Parsnips. An ordinary ox will eat one hundred weight, daily, of the roots, when first put to be fattened. Water is given once in a day, and Cabbages or Potatoes are given occasionally, in order to change the food, and prevent cloying on the Parsnips. Three tons of Parsnips and one ton of hay are required to fatten, by Christmas, an ox of about 70 to 80 stones of dead weight. Young cattle thrive very well on raw Parsnips given them in the cribs during winter. Pigs are beginning to feed on Parsnips, with the tops and roots during the month of September, and soon learn to refuse the tops, and are treated with the roots only, which are best given in a boiled state. No grain is employed as food during the fattening process. It is found that boiling the roots increases the quantity of pork, but the quality is rendered flabby. Pigs of 20 months old reach the large weight of 24 to 32 imperial stones by this treatment. Parsnips increase the quantity of butter, but not the milk, in the case of milch cows—while Turnips increase the milk, and not the butter, which shows the fat-producing quality of Parsnips. The pulpy quality of Parsnips renders the food not comfortable to the human taste, but it may be corrected by eating with it some drier articles, as stale bread, or hardened crusts. One part of Parsnips to two of flour makes good bread, and grated Parsnips with flour in one-third part are boiled in a cloth as dumplings, or baked by the heat of the oven in a pie-dish, constitutes a substantial mess, and may be flavoured to please the palate.

Parsnips contain much saccharine juice, are sweeter than Carrots, and are brewed instead of malt with hops, and fermented with yeast. The liquor is very agreeable to the taste. Parsnips contain in 1000 parts 99 of soluble matter.

Chemical analysis gives more soluble nutritious matter to the Carrot and Parsnip than to the Turnip ; yet the general utility of the latter plant is quite indisputable. For every use of the root, the Turnip is best in the raw state—Parsnips are best when boiled, in every case—Carrots raw for horses, and steamed for swine—Potatoes steamed for horses and pigs, and raw for cattle ; and these preparations, being attended with some expense, add to the ready superiority of the Turnip. *J. D.*

## EMIGRATION.

"National prosperity is just the aggregate of the prosperity of individuals. We do not believe that a society with a more patriotic object could be formed than one to promote emigration." *Agricultural Gazette*, p. 588, 1851.

Is this a true exponent in political economy ? Is it not rather a sophistical putting forth ? Does it not convey the impression that national prosperity is, as it ought to be, an aggregate of the prosperity of every individual of the state, or at least of the far greater number of individuals ? Yet is this strictly true, and may not the national prosperity be very great, while the individual prosperity may be limited to very few, the mass being in some miserable state of existence ? Wealth is the synonyme of prosperity ; England is held rich and prosperous, yet may her state at any moment become bankrupt that her creditors may choose to compel her to pay her debt ; fortunately for her, her own children are her creditors ; but is not her wealth too much concentrated for her general happiness, or is it like the waters of the ocean, but gathered in vast reservoirs from thence to be again dispersed over mountain, plain, and valley.

Let us suppose two nations, each with a population of eight millions, that in the one the whole of the people, as in Belgium, for example, live in much comfort, that such and so diffused is the general prosperity that each individual is able to realise ten shillings a year over his annual expenditure ; the national wealth then, the aggregate wealth of these individuals, who, in their content, form a national guard and security which none dare invade, amounts to four millions. In the other country two millions of the population amass by the labour of the other six millions, who are wretchedly lodged, clothed, and fed like—like—Irishmen—over all costs of realisation six pounds each annually, and the national wealth of this country amounts to twelve millions ; but the mass of the people in their discontent are ready to be led away by any one who holds out any hope of amelioration. The national prosperity or wealth is evidently in favour of the latter nation, but the individual happiness, another term for prosperity, is as certainly in favour of the former.

America is prosperous, but the creators of the prosperity of her southern States are slaves—are these happy. Their numerous attempts to escape from their chains, the recent laws made to favour their recapture, say they are not. In the same condition were our West India Islands in the time of their prosperity.

The Irish, before the loss of the Potato, exported a surplus produce of 13 millions, every individual was a capitalist to the amount of his year's provision—yet was Ireland prosperous or her people happy ? And yet each contributed to the national wealth.

Nature, in the hive of the industrious bee, seems to give us a good lesson on political economy ; the greater the number of working bees, the greater the produce of honey, the more powerful to resist aggression. It appears then a strange corollary that of the lessening the number of creators of national wealth, the working bees, by emigration.

It is said, "Why lament that they are going where they will be better off ?" I am not one of those querulous Irishmen who carp at everything—who, right or wrong, lay all our evils on the shoulders of England, or think that a Government is fully equal to the task of warding off those ills which are the consequences of our own misdeeds, our negligences, or our selfishnesses. I am of those who think that a Government can indeed do very little towards the prosperity of a people, yet that it can do more than it generally does, and that it ought to do it. I do not look upon the prosperity of Ireland, or to the excessive emigration which is now depopulating her as a pure Irish question, but as on its bearing with the prosperity of the United Kingdom. I lament not that any man should avail himself of any honest means of bettering his condition, but I grieve that circumstances should have arisen to make Ireland no longer regarded by Irishmen as their home ; I regret that they should have been forced by the ignorance, the neglect, the supineness, or the inability to meet a great exingency, in those who govern us, to look to America—to a people jealous of our power—as their only refuge from wretchedness, their only resource, save the poor-house, from starvation. I am pained that all these ties of affinity and friendship which constitute the charms of home have been transferred from the Irish soil to the American, and I make these observations with the more heartfelt sorrow, as I am assured it is now too late to check the tide of emigration—the Irishman has ceased to look on Ireland as the home of the Irishman ; all his affections, all the ties that bind him, are in America ; there is, perhaps, scarcely a family in Ireland that has not one of its members in America, who, with the zeal of a proselyte, will exert every means to gain over the rest of his family.

National prosperity, truly, is just the aggregate of the prosperity of its population, and is in proportion to the extent, and to the profitable employment of that population ; and on these also its strength and security proportionally depend. How emigration to a foreign State can tend to these ends I am at a loss to conjecture. Had we, indeed, an excessive population, and an emigration from it peopled a well regulated colony of our own, generally received opinion would be in favour of such an emigration being serviceable to the parent State. But without capital to occupy farms of sufficient extent to employ machinery, the loss of labourers will throw our land out of tillage, we shall cease to be the granary of England, we may become her stock farm; and I should think it a serious question of how far it be good economy to trust a nation's bread to foreign supply. It is well known that in the late war half our troops were Irish; what has been may be again, and in the event of a future war, to the desolate hills and plains of Ireland we may in vain look for the recruiting of our armies. It may not be better economy to find our soldiers in a foreign clime than to look there for our bread.

The diminished population has already been felt in Ireland; this harvest it was difficult to procure reapers for twenty pence a day, while in years when our grain brought in the market half as much more than we are likely now to get for it, thirteen pence a day was a rare thing.

It is true, and there is much reason to grieve that it is so, the wages of labour are too low in Ireland, but the circumstances of the farmers are also so low that they can with great difficulty pay these low wages ; and at such low wages they cannot employ a sufficiency of labour for the ordinary tillage of the land. What then will be the consequences, when, from the decreased amount of labour in the market, its value shall have increased beyond the means of the farmer to employ even enough for the very sordid tillage he can now afford ?

It has been the labour of my life to devise profitable employment for a large, though I will not admit, excessive population ; it has been labour in vain, for now it has become necessary to look to such simple and cheap machinery as will supply the want of hands, and meet the abilities of our farmers and the extent of their farms.

It must appear matter of some wonder, that with naturally superior soil, with lower rents, and with less taxes, and with markets but a shade lower, we should not be able to pay more remunerative wages to our labourers. There is, certainly, in this some want of liberality in the employers, but there generally exists much poverty ; there is very great deficiency of real agricultural capital, and there is no obtaining artificial capital ; the monied man feels no security in the agriculturist, and will rather be content with the small interest the public funds afford, than incur the chance of loss in the high one the farmer would be content to give, and which he could turn to good account. Our banks, in their issues at three months, are only available to men in shop trades ; and even had we banks established suitable to the farmer, under our present circumstances, I fear there are very few that would be trusted. I do not say that they are unworthy of confidence, or that much would be risked, but that they could not give that security which would be reasonably required.

The village farmer in Ireland is so rarely a capitalist, for the richer men are almost invariably graziers, that the land is scarcely ever so laboured or manured as to give the return it is naturally capable of. It appears that when the value of the produce of an acre of land in Great Britain averaged *4l. 7s. 7d.*, that of an acre in Ireland only averaged *2l. 9s. 3d.* With a population of over eight millions, the exports from Ireland in grain, flour, and meal, in the years 1838, 1839, and 1840, amounted in money value to 13,804,311*l.* With a population decreased to six millions and a half in the years 1848, 1849, and 1850, these exports did not reach one-half of that amount, *i.e.*, to only 6,130,217*l.*, nor does this convey a just idea of this decrease in our national wealth ; for in these three last years the humbler classes of our people have been dieted almost exclusively on American Maize, at a cost equal to, if not exceeding, the amount of these exports. Our exports in cattle and in cattle produce have perhaps decreased proportionally, while in swine, poultry, and eggs, they have held no proportion whatever ; they had, indeed, almost ceased altogether.

When our population amounted to eight millions it was calculated that the aggregate of unemployed amounted, in the 12 months, to two millions, or nearly 400,000 virile adults ; it must not, however, be understood that these were all able labourers, at least one-half of them were persons who from age or infirmity would not be employed. In the deaths by famine and disease, consequent on starvation, the proportions between the able-bodied men and the infirm persons and children, perhaps, were as nearly preserved as in ordinary times ; and if we reckon these deaths at one million, able-bodied men to the amount of 200,000 have died. In emigration the great mass has been in adults ; and reckoning it to have amounted to 600,000, we may set down the loss in able-bodied labourers to at least 250,000. Setting then the 200,000 deaths by famine and disease against the 200,000 unemployed previous to the famine, we have 250,000 labourers less than were then found requisite to our agricultural labours. And it is to be recollected that even then none were employed but in the hand-to-mouth operations of cropping and securing crops. No railways, no drainings, made a demand on our labour market.

The agricultural, indeed the general prosperity of Ireland, is to be sought for, not in emigration, not in getting rid of her industrious bees—for her hive is not too crowded, she does not want to throw off a swarm—but in the discovery of some way of supplying her agriculturists with the means of working up the raw material—the land. *J. M. Goodiff, Granard, Sept.* 30.

## Home Correspondence.

*Game.*—I have read many valuable articles of my friend Cuthill's ; but I should flatter him too much were I not *in limine* to inform him that I neither agree with the opinions he has come to against game and game preservers, nor do I like the arguments he has made use of to enforce them ; and I add my own opinion that the sources whence he obtained his information have completely deceived him. For one example among others, in his former letter, Mr. Cuthill asks "if all game-preservers, on becoming farmers themselves, did not give up preserving game ?" To which question I replied that my experience, and it had been rather considerable, was just the reverse to this conclusion ; for, out of all the game preservers I knew, and I add now, out of all that I now know, with one solitary exception, all of them farm a portion of their estates, and some of them farm extensively. In his present letter my friend and opponent, seemingly better to recollect himself, asks if four gentlemen whom he names did not do so. I grant that four might do so ; but then, what does this prove ? Nothing whatever, but that out of a population of 28,000,000 of souls, four whimsical old gentlemen, either from age and infirmity, or from parsimony, or inability, sometime in their lives—towards the close of them probably—ceased to be game-preservers. I grant that they did so, but what then ? I repeat, nothing ; and *ex nihil nihil fit.* I therefore leave my friend's other arguments, and come at once to the subject ; but before I do so, let me, to prevent misrepresentation, again repeat, that I am not a sportsman, and that I but very seldom partake of game when it is placed before me, and am more of a vegetarian than a flesh-eater ; but that I take up this subject purely on public grounds, believing, as I sincerely do, that the benefit derived by the farmer from one kind of game more than compensates for the exaggerated mischief said to be done to

him by the other kind; I know also, that many, I may add most, game-preservers may in many respects be ranked among the most valuable members of the community, and that they are public benefactors. But my friend Cuthill, let us calmly discuss this matter, and do you lay aside a little of your preconceived notions, and listen attentively to what I have to say. I begin then with your own profession. Some time since I saw in a large nursery garden a flock of small fowls, and on inquiring of the proprietor why he kept fowls in his garden, he replied that they were the best friends he had, that before he had them his plants were destroyed by different kinds of insects, but his fowls had cleared them all off for him. Of course the fowls in the garden do the work of winged game in the fields. My next case is that of a friend who has a large farm which had been a wood, and for several years his crops were so very much injured by the ravages of wireworms and other pests of that kind, that I advised him neither to destroy moles nor partridges; and as far he could he followed my advice; but although he endeavoured to preserve his game, his neighbours did all they could to destroy it. But at length the proprietor of the adjoining property commenced preserving game, and the consequence has been so beneficial to my friend, that I think I may state, with confidence, the wireworms and other insect pests, before so injurious to his crops, have been nearly annihilated from his farm; for the last few years I have seen no signs of their ravages, though before many acres were laid bare annually. And again, one more case. The best tenant farmer I know, the man who, at the least expense, with the least quantity of seed, grows the largest crops of every kind of grain, and the largest root crops, protects his game, as far as he can, on account solely of the great benefit he derives from it. He is an enlightened man, and I have listened oft with much pleasure to the reasoning, so consonant to my own convictions, he has made use of in favour of the preservation of game; on his fields also I have often seen the partridges run about, something like barn-door fowls, picking up and devouring every insect they could find. I have, also, often heard him wish that his landlord was a game-preserver, and that a keeper was kept on his estate, to save himself the expense and labour of preserving the game on it. But perhaps it may be said that this farmer does not understand what he is doing, or his own interest. Should it, however, be so said, I just observe in passing on, that I intend one of these days to challenge all England to produce a farmer who understands his profession better, grows more produce on a given quantity of land, or is better able to bid defiance to the times, trying as they now are. But, my friend, you compassionate the poor tenant farmer who has to keep game; but change your compassion another way, and pity the man whose lands are infested with slugs and insects of all kinds, for want of game to destroy them. You pity, also, the fate of the unfortunate poacher, who is caught on a gentleman's estate, armed with deadly weapons, and plundering his property, and prepared to murder the servants who attempt to defend it; and pray pity also, for the cases are equal, the thief who should be caught in your own garden, stealing your delicious fruits, the Black Prince Strawberry for example among the rest; or pity him for stealing your ducks and fowls, or a covey of partridges, or nide of pheasants, if you happen to have them in your preserve, alias your garden. I pity no midnight marauder, whether he be called a poacher, a thief, a highwayman, or felon; nor can I discern much difference between the rogue who steals pheasants and partridges, and the rogue who robs gardens or orchards, or steals barn-door fowls; in my mind a rogue is a rogue, and I think, also, the welfare of society and its safety require that he should be punished; and I think were you to catch him in your preserve, packing up your delicious Grapes, or Strawberries, or Melons, or even a pheasant or two, if, I observe, you happen to have bred any, you would pack him off also to the treadmill, or perhaps send him to New South Wales, to exercise his vocation among his brethren there. I am well aware that the *vox populi* is in favour of the side you have taken; but I know also how easy it is to mislead; and my firm conviction is, that the people are sadly, I might say very unwisely misled in this matter. But let us suppose, for the sake of argument, that some few (for comparatively speaking they are but few) landowners do keep more game than their tenants like; yet I always find that men are ever anxious to become the tenants of such men. But suppose again, but for the sake of argument only, that game may do a few tenants injury; yet their being kept is a public benefit. It is game preservers who supply the markets with hares, rabbits, pheasants, and partridges, and at so low a price, that the labourer and mechanic can purchase and enjoy them equally with the wealthiest personages in the realm. But suppose you had the power to destroy the preserves; or to pass a law that no man should keep any animals except such as you yourself keep or would allow, then in such a case game would be confined to the tables of the wealthy only, for it would soon become so scarce, and consequently dear, that none others could purchase it. But, my friend, you reason as if game had no intrinsic value; but that it is kept only for the pleasures of the breeders of it. But it has a real and substantial value as an article of food; and in my humble opinion, though all in this way receive great benefit from it, yet the greatest benefit is derived from it by the cultivators of the soil. The benefit that partridges do in the fields, and pheasants do on arable lands surrounding woods, in destroying the countless numbers of wireworms which they are so fond of, and all other kinds of insects, injurious to the young crops of corn, are so incalculable, that we cannot estimate it; and when these are taken in the aggregate, the vast good they do throughout the country infinitely counterbalances the injury, let it be what it may, that is done by hares and rabbits. I thus publicly record my opinion, carefully and dispassionately arrived at, that were it possible for the revilers of landlords for keeping game, and the sympathisers of game stealers, to effect the object they are aiming at, they would inflict a very grievous injury on the public at large, and a ruinous one on tenant farmers, whom they profess—but I cannot believe them—to be aiming to serve. But another benefit derived from game preservers, and which must not be forgotten, is, that oftentimes the chief amusement many gentlemen have to reside on their estates, and to become acquainted with their tenants, and their labourers, and the poor in general, is the pleasure they derive from the sports of the field. Destroy this inducement, therefore, and you will inflict a crying evil in every part of the country; for I have lived long enough to know, that it is the manly country gentleman, who resides amongst his tenants, that all, and especially the ministers of religion, must appeal to for assistance in behalf of their poorer bretheren, and not the sympathisers with the midnight poaching bandits, who are always lazy, worthless vagabonds, and who, if they were not in fields and woods, robbing there, would be breaking into peoples' houses, or stopping them on the highways to plunder them of their money, or perhaps take away their lives. My friend, I seldom venture to give advice, but for once I will recommend you to reconsider this matter, and should you do so attentively, I hope you will not denounce any law as barbarous which protects men's properties. Learn, also, to forget that ill feeling towards preservers of game, both masters and gamekeepers, which, with too many others, you seem to possess; but think of them as members of the community, from whom both you and all others receive daily the greatest benefits. Let me, also, correct another mistake you have fallen into, namely, that tenant farmers would, if left to themselves, preserve game. No such thing; for, my friend, if one in one hundred would do so, the rest would do all they could to destroy it, until, at length, there would be none left on their lands; and, in consequence, their otherwise fertile fields would so completly swarm with insects of all kinds, that they would becomd barren, or not pay for cultivation, or grow nothing but weeds. I had just finished writing the foregoing, when I received the *Chelmsford Chronicle*, from which I extract the following information, which, I think, bears out much of the reasoning I have given:—"In 1849, one (London) market alone supplied 4,024,400 head of game." Now, as the greater portion of this supply benefited the farms in which it was produced, and cost the farmers not a shilling a thousand in the feeding of it, I think it bears out what I have endeavoured to establish, namely, that game, in the aggregate, is of immense importance to the country at large, and that the little injury one portion of it does to the cultivators of the lands is more than compensated for by the great benefit bestowed upon them by the other portion. I conclude, therefore, my subject by an extract from Lord Brougham's "Object, Advantages, and Pleasures of Science," namely, "not a step can we take in any direction, without perceiving the most extraordinary traces of design; and the skill everywhere conspicuous is calculated in so vast a proportion of instances to promote the happiness of living creatures, and especially of our own kind; and we can feel no hesitation in concluding, that if we knew the whole scheme of Providence, every part would be found in harmony with a plan of absolute benevolence." To this beautiful sentence, I add my own deliberate opinion, that however minute, all insects are produced with some beneficial design; and that one intention of the creation of the feathered creation, flying from field to field, was to regulate their numbers, and keep them within the bounds designed by the great architect of nature, the allwise, merciful and supreme lord of all. Man, thoughtless man, destroys this balance, and then complains that his crops fail, and his fields are unproductive. *George Wilkins.*

*Agricultural Labourers.*—In your leading article of Sept. 27th, you draw a comparison between the condition of the agricultural labourer in Berkshire and Lincolnshire, taking them as types representing two classes. I have lived among the Berkshire labourers for the last 20 years. Your remarks are written with a knowledge of facts, and are therefore valuable; the mere mention of an evil or abuse is the first step to its removal. There is no reason *à priori* why the Berkshire labourer should be in so degraded a position as to suggest the question, Can we live without parish support? I believe that the leading cause is the past working of the poor-law, which, though altered now, has left its stain behind it. It was in Berkshire that the scale of wages, or payments in aid of wages, was promulgated, which virtually made every agricultural labourer a pauper. I saw it in full operation; I saw its fall, and I hope I may live to see its evil traces obliterated; but such I think is not the case. Even now married men receive higher wages and more regular employment than the single. The farmers consider themselves tied to certain labourers, and the labourers look on the farmers as those who must give them employment, and to whose service they are virtually bound. Now Lincolnshire is a county in which vast tracts have been brought into corn cultivation of late years; it had a new start, the labourers were not born on the land as its cultivators, &c. I feel sure, that the only thing by which the condition of the Berkshire labourer can be improved, is doing away with the present law of settlement. No one man should look on another and feel that he is personally liable to contribute so much hard money to the support of that individual; no farmer should look on a labourer and feel, that if he is thrown out of work and goes to the workhouse he will have to pay for it; and, *vice versâ*, no labourer should feel that he must work for such and such persons, or have no work at all. But the farmers and labourers do feel this, and act upon it. It is often said that farmers give more employment, because they wish to keep the labourer out of the workhouse; but the employment being forced, the wages given have reference to the absolute wants of the employed, they do not represent his earnings—sometimes they exceed, sometimes fall short of these. It is not my purpose to show how an alteration of the law of settlement could be adjusted to existing circumstances in matters of rating, &c., though I think it might be done easily. I am convinced that as it exists it is the great hindrance to the improvement of the condition of the agricultural labourer in Berkshire; till some great change in it is made, he must be degraded and over dependent. The labour market must be free. *A Small Farmer, Berkshire, Sept.* 30. ["M. D." informs us that carters in Berkshire receive 9*s.* a week at present, and during harvest they have either diet or other advantages which produce them about 3*s.* a week in addition. He would not wish to make their wages appear less than they are.]

*The Interests of the Labourer*, which formed the subject of your leader of the 27th of September, merit the careful consideration of everyone engaged in the business of agriculture. It appears to me that those who are entrusted with power in that department of the business of life, which is comprised under the term rural affairs, exercise it without a due consideration of the responsibilities which attach to it. The occupant of a farm is a master, and according to the manner in which he uses his power as master, will he increase or diminish the peace and happiness of those who are his servants. If his only object is to increase the sum which stands to his credit with his banker, we may rest assured that the little power which he possesses is used to the prejudice of the happiness of his fellow creatures. The desire of accumulating money will lead him to give an almost exclusive preference to the active and the nimble, and he will be oblivious of the fact that the happiness of society is chiefly dependent upon the honest and faithful, and those who manifest a disposition to cultivate peace. It is well known what effect the skill of the breeder or propagator has in developing particular qualities of the animal or the vegetable. Let us apply this analogy to the social organism—and we will be at no loss to discover the causes which have originated so much carefulness, and rendered the life of many of our fellow creatures barren of those enjoyments, which, under ordinary circumstances, it may yield to every one. Nothing is blinder than avarice, and the energy with which it acts often raises up the greatest obstacle to the attainment of its own desires. Your thoroughgoing avarice has only one instrument by which it can act upon the human mind, and that instrument is fear. The terror of punishment is its only resource in emergencies. Hence the value and importance of a rural police. I will give one illustration. In a certain English parish, not many years ago, there was a small farmer, who had a small quantity of Wheat taken out of his barn by one of his labourers. The labourer was put into the hands of the police, was tried before a magistrate, and sentenced to some months' imprisonment. While the labourer was confined, his wife and children fell to be supported by the parish; and I have the farmer's own authority for saying that his own share of the poor-rates, which went to the support of the wife and children, exceeded the value of the Wheat which was stolen. Now, what have we in the whole of this process, but an exhibition of the way in which poverty is created, by the working of evil passions. It is quite possible that the farmer considered that he did a meritorious thing by exposing the culprit. It is also quite possible that the magistrate may have commended him for his public spirit. But if he had been master of as much philosophy as to know that evil can never be counteracted by evil, he would have come off with the loss of nothing more than a peck of Wheat. In many cases the happiness of a family may be much promoted by taking the son to perform the father's duties when the latter is incapacitated by age and infirmities. I have lately had an opportunity of witnessing the advantages which result from a little consideration on the part of the farmer in this respect. About six years ago an old man offered his son to a farmer in this neighbourhood as soon as he was capable of discharging a hind's duties. After being two years in this situation, the son was promoted to be first servant upon the farm, perhaps partly from charitable motives. He was found unqualified for this situation, and a younger brother was allowed a hind's wages, in order that he might keep house for the old people, and the oldest son was requested to look about for himself. He is a steady active man, and has acquired, under the superintendence of his master, a competent knowledge of farm book-keeping. And he is now upon the eve of embarking for Australia, where the probabilities are many, that he will be able to raise himself to comfortable independence, and perhaps send a little money to his family at home. *B., East Lothian.*

*Fatting of Early Lambs on Carrot.*—The following paper, by Mr. Joseph Blundell, was read before the

South East Hants Agricultural Association, on Tuesday last:—I beg to offer, in competition for the premium offered by the Society, the following experiment upon the use of the white Belgian Carrot, for the purpose of fatting early lambs, carried out by myself in two successive seasons, in the winters of 1849 and 1850, and also in 1850 and 1851, at my farm at Maidenstoneheath, and also on the farm of Richard Trench, Esq., at Frehills. Having noticed the great value of the White Carrot for the feeding of horses and pigs, I was induced, in the month of November, 1849, to commence an experiment, for the purpose of proving the value of this root for the feeding of early lambs, as compared with that of the Swedish Turnip. I began with giving the Carrots, cut with Gardener's machine, in troughs placed side by side with others containing Swedish Turnips, cut with the same machine, in advance of the hurdles, in the usual manner; and I found, in the course of a day or two, that the lambs had so great a preference for the Carrots that they ate no Swedes as long as any Carrots remained in the troughs; in consequence, I discontinued giving any cut Swedes whilst I had any Carrots for use, they having continued in good condition until the 1st of April. Finding my early Somerset lambs doing so well upon Carrots, I decided upon feeding the South Down lambs upon Mr. Trench's farm in the same manner, and the result was precisely the same, they having refused to eat my cut Swedes, when they could get Carrots. I had no means of proving with accuracy the difference in the quantity of Carrots and Swedes consumed by a given number of lambs, neither did I attempt it, considering their great liking for the Carrot quite conclusive; although I believe a lot of lambs would consume a greater weight of Swedes than of Carrots. The quantity of hay consumed was about the same as in former seasons, when feeding with Swedish Turnips. But I was struck with the apparently diminished quantity of corn and cake consumed by the lambs whilst feeding on Carrots; I therefore determined upon ascertaining the actual quantity of oil-cake and Peas consumed by a lot of 100 lambs whilst feeding on Carrots, as compared with former seasons when feeding on Swedes; and having in previous years found that 100 lambs, being allowed as much as they could eat, consumed on the average four gallons of Peas and 26 pounds of oil-cake per day, for a period of nine weeks, commencing at five weeks old, until they were 14 weeks old, being at that age fit for sale; I then found, to my surprise and satisfaction, that 100 lambs, being fed *ad libitum*, only consumed two gallons of Peas and 14 pounds of oil-cake per day (having at the same time the usual allowance of hay and as many Carrots as they would eat), or, in fact, about one-half the quantity usually consumed before commencing the experiment of Carrot-feeding. I had some thoughts of sending a statement of this experiment to the meeting of this Society last year, but I considered it required further trial before I could offer it with confidence to the notice of the agricultural community; and I can only say, that the like experiment carried out during the past winter has proved quite as successful, and was attended with the same results as in the previous one. The advantages to be derived from feeding lambs with Carrots, I find, consists in the saving of one-half the cost of oil-cake and corn, and that the lambs will be fit for the butcher earlier, and attain a greater weight, and better quality at a given age, than when fed on any other root. In proof of which, I have never, during a period of more than 20 years, sold lambs so fat and heavy at the age, as those which I have fed during the progress of this experiment, and in the manner here described. Should the foregoing statement lead to inquiry upon the subject, and prove serviceable to my brother farmers, it will then have produced the result desired by the author. *Joseph Blundell.*

*Draining.*—The object of draining is to keep the soil comparatively dry and warm during the winter, and moist in the summer. Water does harm where it rests on the land, but good where is percolates through, and afterwards runs off. General principles may be laid down to guide the agriculturist in draining; but carrying out the system depends upon the nature of the land, locality, and other circumstances. What may suit one district in a country, will not answer for another. It seems impossible, as some persons wish, to lay down rules to be strictly adhered to in all cases of draining; as well might they insist upon the same plan of cultivation being adopted for sandy loam and clay land; where a sour blue subsoil exists under astiff clay, deep drains at great distances from each other, are not so beneficial to the land as those sunk 3 feet, and about 21 apart; clay will not allow water to pass through it, till it has been acted upon by the air, unless where it has been moved by the spade or plough. It appears reasonable to suppose, should the foregoing statement be correct, that drains 3 feet deep and 21 apart will loosen clay sooner than those of 5 feet, and 30 feet interval. That solid clay is impervious to water may easily be proved, by digging a hole, and filling it with the element; when it will be found merely to evaporate, unless there is an old drain tolerably close at hand. Rain will not pass through clay till the atmosphere has mellowed and opened it, hence workmen are aware that in stiff land the drains do not run freely for a couple of years, which experience teaches them, though they may not be able to give a reason for the fact. In tapping springs on friable soil, it may be necessary to lay the tiles at a greater depth; indeed such land may be safely drained at 4 feet and 30 feet apart, or even more, in some cases. Tubes should not be less than 2 inches in diameter, and the mains 3 inches; and if made with a shoulder they will remain serviceable so much the longer. The view taken of draining may be erroneous, and the writer will only feel too much obliged to any practical man who will correct any mistakes he may have made. The main point to be ascertained is, what style of draining is the best for a particular soil? What is contended for is, that one plan will not suit every description of land. *Falcon.*

## Miscellaneous.

*The St. Quivox Club at Myremill.*—After seeing the luxuriant crops of grain and Turnips at Morriston and Lyonston, the club went onwards to the almost world-famous farm of Myremill. With many operations on this farm almost every reader is familiar. The plan of collecting the liquid manure of the steading, of allowing it to ferment in capacious tanks, and afterwards of distributing it by steam power, is here followed out on a grand scale. Since the visit of the club last year a large building has been erected and divided into 18 pens, for the purpose of feeding pigs. About 90 are in course of being reared or fattened in it at present. The floors are boarded, with interstices of about half an inch left between the boards, and there is no litter whatever used. The pigs appeared to be clean and comfortable, and they seemed to move about with a tolerable degree of ease upon the boards. The evacuations of the animals, which pass through the interstices, are afterwards carried by a subterranean conduit, to the tanks. This conduit, as well as the space under the boards, and the pens generally, may be rinsed with water from the pipes by introducing a hose into the building as often as it is thought desirable. There is a wide walk along the centre of the house, between the rows of hog-pens, along which food is conveniently carried; and here Mr. Kennedy proposes to lay down a pipe connected with the engine, for the purpose of heating the building in winter by means of escape steam. At another part of the steading preparations are being made for the erection of buildings calculated to house comfortably 400 sheep for winter feeding. The trial which Mr. Kennedy made last winter, in the building which we have described as being now fitted up for pigs, quite convinced him of the propriety of following out this plan. There is to be a wall along one side of the sheep houses, but the erections otherwise are to be entirely of wood. The wood is prepared by being steeped in a solution of lime; and, if by this means one-half of the advantage which is said to be conferred by rendering the wood more durable can be attained, the process must be of very great importance to farmers. Some houses on the estate of Closeburn, which were erected 50 years ago with Scotch grown Larch, prepared in this manner, are said to be still in a good state of preservation. The process is cheap and simple. The wood is first sawn and planed, as it is so hard after steeping that tools will not work upon it. The boards are then sprinkled over with newly slaked lime, and put into a pool, the sides and bottom of which must be nearly water-tight. A little hot lime may be now and again added, to keep up the strength of the solution, and the wood may be allowed to lie immersed in the steep for two or three weeks. But home-grown wood, with the sap in it, must alone be used, as dry foreign wood derives little or no benefit from the process. If such an easy process renders deals doubly more lasting, what is to hinder it from being tried on any farm? The advantages would not be confined to timber employed in building; it might be almost of equal importance to steep flakes, gates, paling, stakes, and even implements after they have been made, such as wheelbarrows and other appliances which are peculiarly liable to rapid decay. Two of the fields at Myremill, which are under Italian Rye-grass, are pastured with a large flock of sheep. It is truly astonishing to see the number which are folded on a small piece of ground, making the side of the field to appear as if half covered with them. Mr. Kennedy is fattening 15 to the imperial acre, and the sheep seem to thrive remarkably well with him. Indeed, we are told that not a single sheep has died at Myremill this season. Mr. Kennedy has also a 12-acre field of Carrots, which we do not think can be excelled in Scotland. The field was dressed with 24 carts to the acre of rough dung from the cattle-boxes. The manure was ploughed into the land in the early part of winter; and this was followed in spring by two applications of liquid manure from the pipes. It ought to be recollected, however, that the solid manure, though rough from the boxes, was a good fertiliser, as Mr. Kennedy's fattening cattle from which it was produced are very highly fed. *North British Agriculturist.*

## Farm Memoranda.

Farming of the Earl of Leicester.—Mr. Bell and myself proceeded to Norwich, in Norfolk, about 80 miles distant, and, the next morning, proceeded to Holkham, about 32 miles from Norwich, the seat of the Earl of Leicester, and examined his fine Devon stock, his farm buildings and farm. The stock was not so extensive as I had anticipated, though there were some very fine animals. He had six or eight beasts fattening for the Smithfield Show, that were very fine, and will prove, I imagine, severe competitors for the short-horns and Herefords. Twelve fine yoke of Devon oxen are employed on the farms, and their quick, elastic tread was a subject of admiration, when compared with the heavy, loggy tread of the English cart horse, to be met with in the north of England, and in some of the central counties. Mr. Keary, the bailiff of the Earl, was absent, so that we had not the privilege of seeing him, as we desired and expected. The crops of Wheat, Barley, and Oats, in Norfolk, are remarkably fine. In fact, taking a district of 10 miles, through which we passed by different routes, I have never seen such uniform heavy fields of Wheat and Barley. The lots here are very much larger than is common in this country; and the system of farming is what is called high farming. The common rotation of crops in Norfolk is:—1. Turnips, with manure; 2. Barley, with manure; 3. Clover, or Beans; 4. Wheat, with manure (special). The Turnips are fed off on the field. On the Clover ley they manure with barn-yard manure and marl, the marl giving a better stand for the Wheat. We saw the fields preparing for the crop of Wheat. The Clover is sown with the Barley and mowed once. We saw at the Earl of Leicester's, the Mangold Wurzel fresh as when pulled from the ground. They place them in the autumn in rows, about 3 feet high, 3 or 4 feet at the bottom, and cover with straw, and take them out as wanted. They were feeding some South-Down and cross sheep for market with these and oilcake, and they were in capital condition. There are 1000 to 1500 sheep constantly on the farm, and they are sending them off to market regularly, and replace by purchase from the north. The fat cattle are in covered stalls, or rather yards, as they have abundance of room, well littered, with water and salt before them; and they are fed with oilcake, Mangold Wurzel, cut too fine, I think, and they feed them what they will eat. The fixtures at the Earl of Leicester's are excellent, and everything about the establishment shows the greatest care, to the very smallest minutiæ of the farm. They were threshing their Wheat with a first-rate portable steam engine, and the amount of work performed by it was very large. Two English gentlemen, whom we met on our return to Norwich, informed us that the use of Rape-cake has proved entirely successful in arresting the ravages of the wireworm in the Turnip crop. They burrow themselves in the Rape, and that is the end of their labours. After leaving Norwich, I took a day at Ipswich, at Ransome and May's great plough and engine establishment, and it is one of the most complete, as it is one of the most extensive, establishments in this country. Nine hundred men are constantly employed. While I was there, five steam-engines were being shipped for Lord Dombrieski, of Russia, for his gold and copper mines in Siberia, and a large lot of ploughs for Valparaiso; but I have not space or time to give a description of this establishment, which I intend to do in full hereafter. I visited a number of farms in Suffolk, where they have good farmers, but their land is not equal to Norfolk, and their crops lighter. The Suffolk polled cows are altogether used for the dairy—they are very excellent milkers, and a valuable breed. The Suffolk Punch horse is here found in great perfection, and they are the best breed of work-horses I have seen. The horses are large, but clean-limbed, good travellers, and very valuable. These are worth from 30*l.* to 60*l.* But I must close. *New York State Agricultural Journal.*

METEOROLOGICAL REPORT.—September—October.
(*Continued from p.* 638.)

| Date. | Time. | Max. | Min. | Wind and Weather. |

| | 11 p.m | 29.72 | ... | steadily. |

¶ The cyclonic nature of this storm at Portland was so evident, that it was adverted to by a correspondent of the *Times*, and by the local newspapers; the violence of it having washed away a considerable portion of the stage-frame of the breakwater of the harbour of refuge in Portland Roads. Although the force of the wind was more particularly experienced there, this storm's eye must have been of considerable extent, as it passed over Woolwich at about the same time, as I there observed the veering of the wind to be nearly the same, and a fine forenoon was succeeded by a rainy disagreeable evening. This storm travelled northward, having come from the south.

† This storm came from the westward, and travelled eastward, being produced by the collapse of the hinder quadrants of preceding storm.

‡ This storm came from the westward, also, and the same observations apply to this as to the preceding storm.

Dorchester [Oct. 9]. *F. P. B. M.*

(*To be continued.*)

## Calendar of Operations.

SEPTEMBER.

West Somersetshire, *Sept.* 29.—The weather of the past month has been of a most delightful autumnal character, but though fine, it has likewise been dry; during that period

north-east winds prevailed, with no rain; consequently vegetation has been retarded, so that the little rain which we had last week was of service, though more is wanted, and is apparently coming. Turnips and Mangold Wurzel are a fair average crop with us this year, though we have complaints in other districts of the former being attacked with a species of caterpillar. Potatoes are affected, but not, I think, to the extent of former years. Owing to the shortness of Grass, we are here, and further up the country, sending sheep to Turnips rather earlier this year; in moist situations, however, the pastures have stood pretty well, the water under keeping them fresh and green, whilst the uplands on the sand and limestone have been brown and burnt up. We had a splendid time for finishing off our harvest, and both hay and corn may be said to be an average, and in localities above an average crop. Advantage was taken of the late slight change in the weather to plough the stubbles, and sow Rye and Vetches. On the subject of the latter crop, there appeared an interesting paper in your last number but one, in all of which I concur, particularly where it is stated that this crop should be (when sheep are on it), mown and put in racks, instead of being trampled down and mixed with their refuse; also in the mode of cultivating winter Vetches followed by Turnips, both consumed by sheep, leaving the soil improved by the double fold, and in a fine state for Wheat. The numbers of agriculturists who have, in common with other classes, visited town and the Exhibition, will no doubt derive benefit, and have the r ideas enlarged and their prejudices ameliorated; and regarding agricultural machinery, new hints will be given, particularly as to the new invention of the reaping machine and other improvements. This last will no doubt at first, as was the case with threshing and other machines, cause discontent to labourers on its first introduction, but will in the end be to their advantage. *E.*

## Notices to Correspondents.

A Tenant holding a Farm, Yearly, from the 5th of April, Subject to Six Months' Notice to Quit.—*J T.* Query: Is a notice served on the 4th day of October legal?

Cochin China Fowls: *J W.* We know of no work specially on this breed, but have made inquiry.

Ear of Wheat: *J W.* It is Triticum compositum, Egyptian Wheat.

Lime made from Chalk: *C L.* It is as valuable as that made from stone, but it is rarely used, because a large dose of unburned chalk is cheaper and as effectual as a small dose of the same after being burned.

Open Boarded Floors for Cattle: *J W* says, "Would Mr. Mechi give the public the benefit of his further experience on the above—particularly would he say what *drawbacks* the system has? Has he, or have any of your readers tried open boarded floors for *milch cows?*"

Poultry: *T B W.* Silk fowls are not excluded from the "Midland Counties Poultry Show." They come in the class of other distinct breeds or varieties, to which the judges, by the rules, have power to award such prizes as they may seem to merit. A separate class for each denomination of fowl would be impossible, but prizes are provided for all. *J. Baily*, 113, *Mount-street.*

Waterproofing: *W W R P* wants a recipe for waterproofing a rick cloth.

Weeds, &c.: *T F.* We would advise industry in fallowing during hot, dry weather, and *not* salt. Drain from the lowest level you can get with a slight fall, till you get 3½ feet deep, and then keep that depth through the rest of the field.

# Markets.

## COVENT GARDEN, Oct. 11.

A few melting Peaches may yet be obtained. English Pines are large and fine. Grapes are abundant. Dutch Hamburghs are imported in considerable quantities, and good ones realise as much as 9d. and 1s. 3d. per lb. Pears are also brought from the Continent. The best English kinds are Gansel's Bergamot, Brown Beurré, and Marie Louise. These fetch from 2s. to 4s. a doz., and 8s. to 12s. per half sieve. Damsons are scarce. A cargo of St. Michael Oranges has just arrived, which is at least a month before the usual time. Nuts remain nearly the same as quoted last week. Some Spanish ones have made their appearance. Carrots, Turnips, Cabbages, &c., are sufficient for the demand. Potatoes are generally good in quality. Lettuces and other salading are sufficient for the demand. Mushrooms are scarce. Cut flowers consist of Heaths, Pelargoniums, Mignonette, Heliotropes, Stephanotis, Bignonia venusta, and Roses.

### FRUIT.

| | |
|---|---|
| Pine-apples, per lb., 3s to 6s | Almonds, per peck, 6s |
| Grapes, hothouse, p. lb., 2s to 5s | — sweet, per lb., 2s to 3s |
| — Lisbon, per lb., 9d to 1s | Oranges, per doz., 2s to 4s |
| Peaches, per doz., 6s to 12s | — per 100, 14s to 30s |
| Melons, each, 1s to 4s | Nuts, Barcelona, p. bsh, 20s to 22s |
| Damsons, p. half sieve, 6s to 7s | — Brazil, p. bsh., 12s to 14s |
| Apples, kitchen, p. bsh., 1st o 1s 6d | Filberts, per 100lbs., 70s to 90s |
| Pears, dessert, p. doz., 2s to 4s | Walnuts, per bush., 12s to 24s |
| Lemons, per doz., 1s to 2s | |

### VEGETABLES.

| | |
|---|---|
| Cabbages, per doz., 8d to 1s | Shallots, per lb., 3d to 6d |
| Cauliflowers, p. doz., 6d to 3s | Garlic, per lb., 4d to 6d |
| French Beans, p. h. sieve, 2s to 4s | Artichokes, per doz., 4s to 6s |
| Beans, per sieve, 1s 6d to 2s | Lettuce, Cab., p. score, 4d to 1s |
| Peas, per sieve, 1s 9d to 3s 6d | — Cos, per score, 3d to 1s |
| Potatoes, per ton, 45s to 80s | Small Salads, p. punn., 2d to 3d |
| — per cwt., 2s to 5s | Horse Radish, p. bundl., 1s 6d to 6s |
| — per bush., 1s 6d to 2s 6d | Red Beet, per doz., 1s to 2s |
| Turnips, p. bunch, 2d to 4d | Mushrooms, p. pot., 1s 6d to 2s |
| Cucumbers, each, 1d to 1s | Sorrel, per hf. sieve, 6d to 9d |
| Radishes, per doz., 9d to 1s 6d | Tomatoes, p. half sieve, 3s to 4s |
| — Turnip, p. doz., 1s to 1s 6d | Fennel, per bunch, 2d to 3d |
| Celery, p. bundle, 6d to 1s 6d | Savory, per bunch, 2d to 3d |
| Carrots, per bunch, 4d to 6d | Thyme, per bunch, 2d to 3d |
| Spinach, per sieve, 1s 6d to 2s | Parsley, per doz. bun., 2s to 3s |
| Vegetable Marrows, per doz., 1s to 1s 6d | — Roots, p. bundl. 9d to 1s |
| Onions, p. bunch, 1d to 5d | Mint, per bunch, 1d to 2d |
| — Spanish, p. doz., 1s 6d to 3s | Basil, p. bunch, 3d to 4d |
| Leeks, per bunch, 1d to 2d | Marjoram, do., 3d to 4d |
| | Watercress, p. 12 bunch., 4d to 6d |

## COAL MARKET.—Friday, Oct. 10.

Eden Main, 16s. 6d.; Wallsend Haswell, 17s. 6d.; Wallsend Hetton, 17s. 6d.; Wallsend Lambton, 17s. 6d.; Wallsend Stewarts, 17s. 6d.—Ships at market, 230.

## HAY.—Per Load of 36 Trusses.

### Smithfield, Oct. 9.

| | | | |
|---|---|---|---|
| Prime Meadow Hay | 70s to 75s | Clover ... ... ... | 60s to 84s |
| Inferior ditto... ... | 55 65 | New do. ... ... ... | — — |
| Rowen ... ... ... | 60 63 | Straw ... ... ... | 22 27 |
| New Hay ... ... | — — | | J. Cooper. |

The trade heavy.

### Cumberland Market, Oct. 9.

| | | | |
|---|---|---|---|
| Prime Meadow Hay | 75s to 80s | Inferior ... ... ... | 68s to 78s |
| Inferior ditto... ... | 60 70 | New Clover ... ... | 65 75 |
| New Hay ... ... | 60 70 | Straw ... ... ... | 24 28 |
| Old Clover ... ... | 84 90 | | Joshua Baker. |

### Whitechapel, Oct. 9.

| | | | |
|---|---|---|---|
| Fine Old Hay ... | 70s to 76s | Old Clover ... ... | 80s to 88s |
| Inferior ditto... ... | 50 60 | Inferior ditto ... | 70 80 |
| New Hay ... ... | 63 70 | New Clover ... ... | 70 84 |
| Straw ... ... ... | 22 25 | Inferior ditto... ... | 50 63 |

## HOPS.—Friday, Oct. 10.

Messrs. Pattenden and Smith report that the demand for choice new Hops continues to improve, and prices for all sorts fully maintained. Letters from the Continent state that the growth of Hops there falls fully two-thirds short of an average crop, in consequence of which the merchants here are exporting largely both old and new Hops. Present prices:

| | | | |
|---|---|---|---|
| Mid & East Kents | 168s to 252s | Sussex ... ... | 120s to 140s |
| Weald Kents ... | 130s to 150s | Farnhams ... | 168 —252 |

Duty 115,000*l.*

## SMITHFIELD, Monday, Oct. 6.

The number of Beasts to-day is rather smaller, but still it exceeds the demand. A few of the choicest make 3s. 6d., but it is too high to quote; on the whole, prices are about the same as on Friday last. Several second-rate remain unsold. The supply of Sheep is not quite so large as of late; trade is more cheerful, but only in few instances higher prices are obtained. Good Calves are scarce and rather dearer. From Holland and Germany there are 1458 Beasts, 3340 Sheep, 98 Calves, and 149 Pigs; and from Leicester, Northampton, and Lincoln, 2550 Beasts.

| Per st. of 8 lbs.— | s | d | s | d | Per st. of 8 lbs.— | s | d | s | d |
|---|---|---|---|---|---|---|---|---|---|
| Best Scots, Hereford, &c. ... | 3 | 2 | to 3 | 4 | Best Long-wools . | 3 | 6 | to 3 | 8 |
| Best Short-horns | 3 | 0 | — 3 | 2 | Ditto Shorn ... | | ... | | |
| 2d quality Beasts | 2 | 0 | — 2 | 8 | Ewes & 2d quality | 3 | 0 | — 3 | 4 |
| Best Downs and Half-breds ... | 3 | 10 | — 4 | 0 | Ditto Shorn ... | | ... | | |

| | | | | | Calves ... ... | 2 | 8 | — 3 | 10 |
| | | | | | Pigs ... ... | 3 | 4 | — 4 | 0 |

Beasts, 5951; Sheep and Lambs, 27,090; Calves, 185; Pigs, 550.

## Friday, Oct. 10.

The number of Beasts is large, but principally inferior in quality. Many middling ones remain unsold. On the average of business done (which is but trifling), prices range about the same as on Monday. We have a fair supply of Sheep; trade is cheerful for them at late rates. Good Calves are scarce and quickly sold; indeed, all kinds meet with a more ready sale. From Germany and Holland we have 649 Beasts, 1420 Sheep, and 125 Calves; and from the home counties we have 126 milch cows.

| | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| Best Scots, Hereford, &c. ... | 3 | 2 | to 3 | 4 | Best Long-wools . | 3 | 6 | — 3 | 8 |
| Best Short-horns | 3 | 0 | — 3 | 2 | Ditto Shorn ... | | ... | | |
| 2d quality Beasts | 2 | 0 | — 2 | 6 | Ewes & 2d quality | 3 | 0 | — 3 | 4 |

| | | | | | Calves ... ... | 2 | 10 | — 3 | 10 |
| | | | | | Pigs ... ... | 3 | 4 | — 4 | 0 |

Beasts, 1262; Sheep and Lambs, 5510; Calves, 296; Pigs, 490.

## MARK LANE.

Monday, Oct. 6.—The supply of Wheat from Essex and Kent to this morning's market was smaller than of late, which enabled factors to realise 1s. per qr. advance. There was an improved demand for foreign, on the extreme terms of this day se'nnight, and in some instances more money was obtained. A cargo or two of Polish Odessa Wheat has been disposed of at 30s. 6d., cost and freight to the Continent, but they are generally held for more money.—There is no alteration in the value of Barley; inferior descriptions are a dull sale. —White Peas are very scarce, and bring 1s. to 2s. per qr. more money; other sorts are unaltered in value.—Beans are cheaper. —Old Oats meet a fair inquiry at late rates; new are 6d. per qr. cheaper.—The best marks of foreign Flour must be written 6d. per sack and barrel dearer.

| Per Imperial Quarter. | s. | s. | | s. | s. |

Friday, Oct. 10.—The arrivals of all grain and Flour this week have been small. This morning's market was fairly attended, and the business transacted in Wheat off the stands was not large, but at extreme rates. Floating cargoes of Polish Odessa have been sold at 31s. 6d. cost and freight to the Continent; 31s. cost, freight, and insurance to Dublin. There is no alteration in the value of Barley, Beans, and Peas; inferior Barley and Oats are a very slow sale.—Flour meets a fair trade at full prices.

Liverpool, Tuesday, Oct. 7.—Except a moderate supply of Oats and a fair quantity of Oatmeal, the fresh arrivals into this port from Ireland, and those generally coastwise are still very inconsiderable. At our Corn Exchange this morning we experienced a moderate demand for fair runs of foreign Wheat from country millers, at a further slight improvement upon that of Friday, increasing the quotations for such 1d. to 2d. per 70 lbs. upon the rates of this day se'nnight. Of farmers' new Wheat, the supply was large, and the condition being good attracted attention in preference to the former. Barley and Malt, the former being scarce, fully supported late prices. Beans were little noticed, but unaltered in value. Peas improved 1s. per qr. Oats were rather cheaper, and Oatmeal declined 6d. per load. Indian Corn maintained its previous value.—Friday, Oct. 3.—At our market this morning, the Wheat trade assumed a firmer aspect, and in most descriptions of foreign Wheats transactions to a fair amount were entered into, at an advance of 1d. per 70 lbs. all qualities of new supporting previous quotations. As little or no Barley remains here, prices are nominal. Beans and Peas, upon a limited inquiry, sustained their late value. Oats were cheaper, and Oatmeal hardly maintained the rates of Tuesday. Indian Corn, being in slow request to day, merely supported the terms last noted.

GREEN AND HOTHOUSE BUILDER.—Green and Hothouses made by Machinery, sent to all parts of the United Kingdom. These Horticultural Buildings are warranted to be made of the best materials, and the cheapest in England. Lists of prices post free. 1½ in. greenhouse lights, 2½*d.*; 1¾ in. ditto, 3*d.*; 2 in. ditto, 3½*d.* per foot; if glazed with 16 oz. sheet-glass of a large size, 4*d.* per foot extra.
J. Lewis, Horticultural Works, Stamford-hill, Middlesex.

WARMING AND VENTILATING FOR CHURCHES, CONSERVATORIES, AND OTHER BUILDINGS.—The most efficient and economical Hot-water Apparatus, supplied and erected for the above purposes, fitted with improved boilers, requiring no brick-work, capable of working 14 hours without attention. Also the THERMANTERION, a cheaper and simpler apparatus, especially adapted for buildings only used occasionally.—Apply to Spiller and Tayler, Battersea, near London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER, AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.

GRAY AND ORMSON, Danvers-street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are now in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen, and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-Water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

THE ROYAL EXHIBITION.
FLOWER-POTS! FLOWER-POTS!! FLOWER-POTS!!!

CHARLES PHILLIPS, Potter, of Weston-Super-Mare, having been requested by the principal Nurserymen of England to publish a complete LIST of the clear inside diameter of all Pots manufactured by him, begs leave to subjoin the following:—

| No. | Size. | No. | Size. | No. | Size. | No. | Size. |
|---|---|---|---|---|---|---|---|
| 1 | 1¾ in. | 6 | 4¾ in. | 11 | 8¾ in. | 16 | 15 in. |
| 2 | 2¼ ,, | 7 | 5¼ ,, | 12 | 9¼ ,, | 17 | 16 ,, |
| 3 | 2¾ ,, | 8 | 6¼ ,, | 13 | 11 ,, | 18 | 18 ,, |
| 4 | 3¼ ,, | 9 | 7 ,, | 14 | 12¼ ,, | 19 | 20 ,, |
| 5 | 4 ,, | 10 | 8 ,, | 15 | 14 ,, | 20 | 22 ,, |

Saucers and Seed Basins the same width as the Pots.

Persons visiting the Royal Exhibition can inspect Charles Phillips's Pottery, &c., in the Model Greenhouse, situate at the West Entrance of the Crystal Palace. C. P. deems it superfluous to laud either the quality of his Clay, or the style in which his goods are manufactured, but confidently refers those parties who have not yet patronised him to the Royal Gardens at Frogmore and Kew, and to the principal Nurserymen in London, Slough, Reading, Oxford, Swindon, Cirencester, Stroud, Worcester, Gloucester, Cheltenham, Bath, Bristol, Taunton, Tiverton, Exeter, Torquay, Totnes, Plymouth, North and South Wales, &c., &c., for the quality of the articles which he has had the honour of supplying them with. All orders for the above Goods will be promptly forwarded, Carriage Free, to any Railway Station within 150 miles of the Manufactory, either in dozens, casts, hundreds, or thousands. Every description of Red Ware, Sewerage, Piping, Closet-Pans, Chimney-Pots, Land Drain Pipes, Seakale Pots, Vases, Tiles, Bricks, &c.

Lists of Prices, Terms, &c., forwarded to any address.
Manufactory, Locking Road, Weston-Super-Mare, Somerset.
Established 1836.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL AND Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING

Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained two Silver Medal Prizes, and is the Felt solely patronised and adopted by

Her Majesty's Woods and Forests,
Honourable Board of Ordnance,
Honourable East India Company,
Honourable Commissioners of Customs,
Her Majesty's Estate, Isle of Wight,
Royal Botanic Gardens, Regent's Park,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry and at the Royal Agricultural Society's House, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

Price One Penny per Square Foot.

⁂ Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are F. M'NEILL AND CO.'S

Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where Roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance of Westminster Hall, were roofed with F. M'Neill and Co's Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

Note.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

## HARTLEY'S PATENT ROUGH PLATE GLASS, FOR RIDGE AND FURROW ROOFS, GREENHOUSES, RAILWAY STATIONS, ENGINE SHEDS, MILLS, MARKET-HALLS, AND PUBLIC BUILDINGS GENERALLY.

For Conservatories, Public Buildings, Manufactories, Skylights, &c. &c.

| | ⅛ inch thick. | 3-16th inch thick. | ¼ inch thick. |

| 7 by 5 | ,, | 7½ by 5½ | ... ... ... ... | | 12 | 0 |
| 8 by 6 | ,, | 8½ by 6½ | ... ... ... ... | | 13 | 0 |
| 9 by 7 | ,, | 9½ by 7½ | and 10 by 8 ... ... ... | | 15 | 0 |

NOTE.—Squares are charged according to the superficial contents, except where the length exceeds the restriction above, in which case the higher price is charged irrespective of the contents.

*Bending.*—1-8*th*, 6*d.*; 3-16*ths*, 9*d.*; ¼ *inch*, 1*s. per foot, net.*

*Irregular shapes are charged as squares.*

*When Crates are ordered, the 30-inch widths will be sent, unless otherwise specified.*

THE PATENT ROUGH PLATE, one-eighth of an inch thick, and weighing 2 lbs. to the foot, has now become an article of very extensive and increasing consumption.

*It is universally admitted to be the best and most suitable Glass for Ridge and Furrow Roofs, Greenhouses, Factories, Workshops,*

And all such like purposes, and is a cheap and efficient substitute for Fluted or Obscured Glass, where the object is to intercept the vision without diminishing the light. Its non-transparency, strength, and cost (being no more weight for weight than Common Sheet Glass), render it eminently suitable for the Glazing of Conservatories and Roofs of all kinds; Blinds are unnecessary, and when used in Greenhouses *no scorching occurs.*

Where still greater strength is required the 3-16ths and ¼ inch thick will be found much cheaper than the Common Rough Plate. Samples will be forwarded on application, by applying to JAMES PHILLIPS & CO., HORTICULTURAL GLASS MERCHANTS, 116, BISHOPSGATE-STREET WITHOUT, LONDON.

### GLASS WATER PIPES.

MESSRS. COATHUPE AND CO., CROWN and SHEET GLASS MANUFACTURERS, Nailsea, near Bristol, Somerset, beg to inform Engineers and others that they are supplying GLASS PIPES, with their Joints, from 2 to 4 inches bore, capable of bearing very great atmospheric pressure, in lengths from 3 to 7 feet, the lengths being less as the diameter of the bores increase. These Pipes may be seen at the Exhibition (Class 24, Section 47), with their forms and modes of joining, in the Section allotted to the Glass Manufactures; and references can be given of their great utility in numerous localities, where they have been successfully employed. The great advantage of Glass Pipes for the conveyance of pure water over all metallic substances, has been too largely dwelt upon by medical and scientific authorities to require any further comment.

Nailsea Glass Works, near Bristol.

### GLASS FOR CONSERVATORIES, &c.

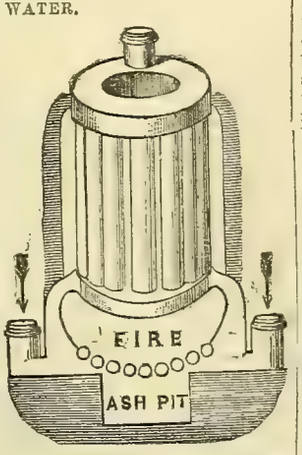
HETLEY AND Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 35, Soho-square, London.

See the *Gardeners' Chronicle* first Saturday in each month.

### GLASS.

THOMAS MILLINGTON'S FOREIGN SHEET GLASS is far superior to any other manufacture, as well as cheaper. In 100 feet boxes packed for immediate delivery.

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| 6 inches | by 4 | and | 6½ | by 4½ | ... ... ... | 13*s.* | 0*d.* |
| 7 ,, | 5 | ,, | 7½ | by 5½ | ... ... ... | 15 | 0 |
| 8 ,, | 5 | and | 8 | by 5½ | ... ... ... | 15 | 0 |
| 8 ,, | 6 | and | 8½ | by 6½ | ... ... ... | 17 | 6 |
| 9 ,, | 7 | and | 10 | by 8 | ... ... ... | 20 | 0 |
| 12 ,, | 10 | and | 13 | by 9 | ... ... ... | 20 | 0 |



And many other sizes, or cut to order in various thicknesses. Cases containing large Sheets, in 100, 200, and 300 feet, at 21*s.* per 100 feet.

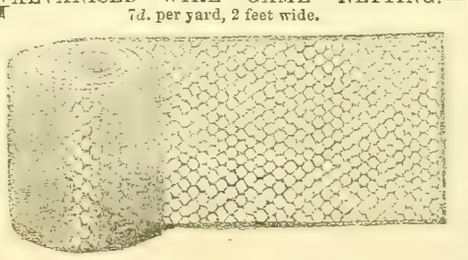
ROUGH PLATE, perfectly flat, ⅛ in. thick, best manufactured.

| | | | | |
|---|---|---|---|---|
| In sizes under 15 inches | ..... | 6*d.* | per foot. |
| ,, ,, 35 ,, | ..... | 8*d.* | ,, |
| ,, ,, 50 ,, | ..... | 9½*d.* | ,, |
| ,, ,, 75 ,, | ..... | 12*d.* | ,, |

Milk Pans, 2*s.* to 6*s.* each; Metal Hand-frames, Glass Tiles and Slates; Cucumber, Propagating, and Bee Glasses; Wasp Traps, Glass Shades, and Plate Glass, at 87, Bishopsgate-street Without, same side as Eastern Counties Railway.—Established 100 years.

### HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

J. WEEKS AND Co., King's-road, Chelsea, HORTICULTURAL ARCHITECTS, ENGINEERS, and BUILDERS. These Boilers are very powerful, durable, and economical. The fire warranted to last 15 hours without attention. The Furnace Bars are Hollow Tubes, through which the return water passes before entering the upper part of the Boiler, thereby causing a very rapid circulation, and producing double the effect from the same quantity of fuel.



J. WEEKS and Co., King's-road, Chelsea, CHALLENGE the whole world to make a Boiler that will produce anything like the same effect, with the same quantity of Fuel, in a given time. It is one of these Boilers that warms the water of their VICTORIA REGIA Tank, which contains 9000 gallons, and also heats several large Forcing-houses and ranges of Pits, with a small consumption of fuel.

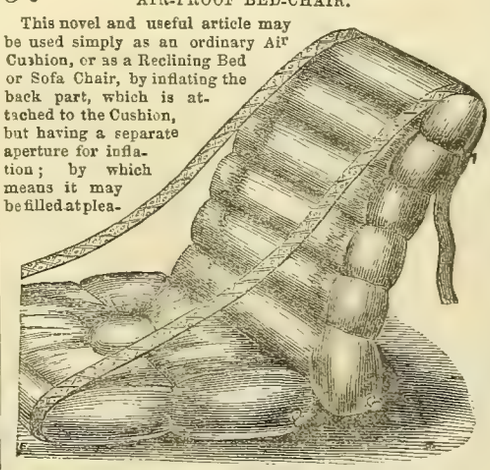
Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

### GREENHOUSE AND CONSERVATORY BUILDING ESTABLISHMENT, HOT-WATER APPARATUS MANUFACTORY, KENSALL-GREEN, HARROW-ROAD, LONDON.

JOHN TAYLOR begs most respectfully to call the attention of the Nobility, Gentry, and Gardeners, to the very superior manner in which he erects all kinds of Greenhouses, Conservatories, Forcing Pits, &c., and all other buildings for Horticultural purposes, combining all the most modern improvements with elegance and utility. His manner of heating Horticultural Buildings, Churches, Chapels, Public Buildings, Entrance Halls, &c., has received the greatest approbation from the Nobility and Gentry by whom he has been extensively engaged.

### GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.

| | | Galvanised. | Japanned Iron. |
|---|---|---|---|
| 2-inch mesh, light, 24 inches wide | ... | 7*d.* per yd. | 5*d.* per yd. |
| 2-inch ,, strong ,, | ... | 9 ,, | 6½ ,, |
| 2-inch ,, extra strong ,, | ... | 12 ,, | 9 ,, |
| 1½-inch ,, light ,, | ... | 8 ,, | 6 ,, |
| 1½-inch ,, strong ,, | ... | 10 ,, | 8 ,, |
| 1½-inch ,, extra strong ,, | ... | 14 ,, | 11 ,, |



All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised sparrow-proof netting for Pheasantries, 3*d.* per square foot. Patterns forwarded post free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

### THE GREAT EXHIBITION, HYDE PARK.

North-west Gallery—Class 28, No. 83.

J. L. HANCOCK'S INFLATED INDIA-RUBBER AIR-PROOF BED-CHAIR.

This novel and useful article may be used simply as an ordinary Air Cushion, or as a Reclining Bed or Sofa Chair, by inflating the back part, which is attached to the Cushion, but having a separate aperture for inflation; by which means it may be filled at pleasure to any degree of tightness, and set to any angle. Invalids will find this article admirably adapted for great ease and comfort, either on a bed or sofa.

VULCANISED INDIA RUBBER HOSE PIPES for Breweries, Fire-Engines, Watering Gardens, and Flexible Gas Tubing of various kinds.

Portable India-Rubber Shower and Sponging Baths, Waterproof Fishing Boots, Air Cushions and Beds, made any size to order.

All orders addressed to JAMES LYNE HANCOCK, India-Rubber Manufactory, Goswell-road, London, will meet with immediate attention.

CHEAP GLASS.—16 oz. Glass supplied for garden purposes at 2½*d.* per foot; small sizes, 1*d.* per foot; Lights Primed and Glazed, from 1½*d.* to 3*d.* per foot; at HICKSON'S Foreign and English Glass Warehouse, 46, Long Acre, London.

GREENHOUSES.—To be Sold, a bargain, Two Strong-built Greenhouses; one 18 feet long by 10 feet wide, the other 25 feet long by 12 feet wide. A Plan and Particulars sent by addressing a letter to Mr. SMITH, 85, White Lion-street, Islington, London.

### ADULTERATION OF FOOD.

HENRY BAKER, OPTICIAN, 90, Hatton Garden, London, begs to call attention to his ACHROMATIC MICROSCOPES (warranted good) which will be exchanged if not approved of. These Instruments will define the Circulation of the Blood in the Frog's Foot, the Saw in the Sting of the Wasp, the Comb in the Spider's Foot, the beautiful form and varieties of Pollen in Flowers and their Structure, the Scales of the Butterfly's Wing, and also in many instances Adulteration of Food. It is a very interesting companion, and will pass away usefully many a leisure hour, the fund for observation being inexhaustible. Price for No. 1, 3*l.* 12*s.*; No. 2, 5*l.* 15*s.*; No. 3, 9*l.* 10*s.* A descriptive Book, sent post free, on receipt of three postage stamps. Prepared objects, 12*s.*; injected do., 30*s.* per dozen.

### VINAIGRE DE BORDEAUX.

PURE WINE VINEGAR (preferable to any other) of the finest quality, highest strength, well matured, and in colour and brilliancy like the wine from which it is made.—Sold by Chemists, Grocers, and Wine Merchants throughout the kingdom, whose names may be learnt on application to the importers, W. and S. KENT and SONS, Upton-on-Severn.

N.B.—Export orders from Bonded Warehouses ex duty.

Stores in London, Liverpool, and Hull.

### ZOOLOGICAL GARDENS, REGENT'S PARK.—

The URAN UTAN, presented by the Governor of Singapore, is exhibited daily, together with the ELEPHANT CALF, and the HIPPOPOTAMUS, presented by H. H. The Viceroy of Egypt. Admission, 1*s.* On MONDAYS, 6*d.*

INTERESTING FACT.—"The following singular and authentic case of restoration of the human hair is worthy of observation, more particularly as it relates to an article of high and universal repute during the last half century. Mr. A. Hermann, of Queen-street, Soho, had been quite bald for some time past, and had tried various preparations for the recovery of his hair, but without any beneficial result. He was then induced to try the effects of 'ROWLANDS' MACASSAR OIL,' and after daily applying it for about two months, he, much to his gratification, had his hair quite restored, and now possesses a beautiful head of hair. The fact speaks too strongly for itself to require comment."—*Bell's Weekly Messenger.*

### ROWLANDS' MACASSAR OIL.

The unprecedented success of this discovery in restoring, preserving, and beautifying the human hair, is too well known and appreciated to need comment. For Children it is especially recommended, as forming the basis of a beautiful head of hair, and rendering the use of the fine comb unnecessary.—Price 3*s.* 6*d.*, 7*s.*; family bottles, equal to 4 small), 10*s.* 6*d.*, and double that size, 24*s.* per bottle.

N.B. Each bottle of the genuine article has the words—ROWLANDS' MACASSAR OIL, engraved in two lines on the wrapper; and on the back of the wrapper nearly 1500 times, containing 29,028 letters.

Sold by A. ROWLAND and SONS, 20, Hatton Garden, London; and by Chemists and Druggists.

### NEW SHOW ROOMS FOR BEDSTEADS.

HEAL AND SON have erected some extensive Warerooms for the purpose of keeping every description of Bedsteads. In Iron their stock will include every sort manufactured, from the cheap Stump, for servants' use, to the handsomely ornamented tubular-pillared Canopy, as well as Brass Bedsteads of every shape and pattern; and in wooden Bedsteads their Rooms are sufficiently extensive to allow them to fit up a variety, both in Polished Birch and Mahogany, of Fourpost, Canopy, and French, and also of Japanned Bedsteads—in fact, to keep in Stock every sort of Bedstead that is made; and they have also a general assortment of Furniture, Chintzes, Damasks, and Dimities, so as to render their Stock complete for the Furnishing of Bedsteads as well as Bedding. And without attempting to compete with the prices at which the lowest class of Furniture is sold, and which is fit for no useful purpose, their new Stock will be found to be priced on the same principle by which their Bedding trade has, during the last 30 years, been so successfully extended, and the goods, whether of a plain and simple pattern, or of a handsomer and more expensive character, are of well-seasoned materials, sound workmanship, and warranted.

HEAL and SON'S list of Bedding, containing full particulars of Weight, Sizes, and Prices of every description of Bedding, sent free by post, on application at their Factory,

196 (opposite the Chapel), Tottenham Court Road, London.

HOUSE FURNISHING AND INTERIOR DECORATIVE ESTABLISHMENT, 451, OXFORD-STREET, LONDON.—Cabinet Furniture of every description at marked prices—Brussels Carpet, 2*s.* 6*d.* per yard.—Damask Curtains, 10*d.* per yard and upwards; Ditto, in Silk and Worsted (French fabric), nearly two yards wide, at 8*s.* per yard.—The best Floor Cloths that can be made, cut to any dimensions, 2*s.* 3*d.* per yard. The largest Manufactory in London for Paper Hangings, English and French Decorations, adapted either to the Cottage or the Mansion, fitted up, showing the side of a room finished for occupation.

"FRIGI DOMO."—A Canvas, made of prepared Hair and Wool, a perfect non-conductor of Heat and adapted to many Horticultural and Floricultural purposes for covering over frames where a fixed temperature is required. It is 2½ yards wide, and of any required length, at 1*s.* 4*d.* per yard run.—Manufactured only by E. T. ARCHER, Carpet Manufacturer, 451, New Oxford-street, London.

METCALFE AND Co.'s NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1*s.* An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY and Co.'s, Sole Establishment, 130 B, Oxford-street, one door from Holles-street.

METCALFE'S ALKALINE TOOTH POWDER, 2*s.* per box.

CAUTION.—Beware of the words "From METCALFE'S," adopted by some houses.

## SALES BY AUCTION.

ISLINGTON NURSERY.
TO NOBLEMEN, GENTLEMEN, NURSERYMEN, BUILDERS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed, by Mr. G. Smith, to offer to public competition by Auction, on the premises, on MONDAY, October 13th, and two following days, at 11 o'clock each day, in consequence of the Land being let for building, the whole of the valuable NURSERY STOCK, comprising several thousand scarlet, white, and Hybrid Rhododendrons, Ghent, and other Azaleas, variegated and green Hollies, of various sizes, in considerable quantities, several thousand Aucuba japonica, from 1 to 4 feet; a large quantity of fine Mulberries of different ages, many of which are fine bearing trees, &c.—May be viewed prior to the sale.—Catalogues had on the premises, of the principal Seedsmen in London, and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, at the Mart, Bartholomew-lane, on THURSDAY, October 16, at 12 o'clock, a first-class collection of DUTCH BULBS, comprising fine Double and Single Hyacinths, Narcissus, Jonquils, Tulips, Crocus, Snowdrops, Anemones, Gladiolus, &c.; a selected assortment of American Plants, consisting of Ghent and other Azaleas; Hybrid Rhododendrons, Andromeda floribunda, Kalmias well set with bloom-buds, the best varieties of Standard and Dwarf Roses, &c.—May be viewed the morning of sale. Catalogues may be had at the Mart; and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO NOBLEMEN, GENTLEMEN, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed by the Proprietor to sell by public Auction, on the premises, Chester Nursery, Kennington (near Walcot-terrace), on FRIDAY, October 17th, and following day, at 11 o'clock each day, the whole of the NURSERY STOCK, comprising Chinese Arbor-Vitæ, Aucuba, Evergreen Privet, Lilacs, Dwarf Roses, Gooseberries, Currants, &c.; Greenhouse Plants, consisting of the newest varieties of Geraniums, Fuchsias, Chrysanthemums, and Roses in pots, Camellias, Genista, Verbenas, &c.; five newly erected Greenhouses, 10 ranges of Pits and Boxes; together with about 600 feet of capital 4-inch hot-water Pipe, three excellent Boilers; a useful Horse, Spring Cart; a considerable quantity of Bricks, Garden Pots; Compost, and sundry effects. May be viewed prior to the sale; Catalogues (6d. each, returnable to purchasers) had on the premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

VERY IMPORTANT SALE OF NURSERY STOCK, GREENHOUSES, &c., at
FAIRFIELD NURSERY, LONDON-ROAD, LIVERPOOL, THE PROPERTY OF THOMAS WHALLEY.

MESSRS. PROTHEROE AND MORRIS are instructed by the Proprietor to sell by public Auction, without reserve, on MONDAY, the 20th October instant, and following days, the Site of the Nursery being sold to a Building Society, the whole of the large NURSERY STOCK, covering upwards of 12 acres of Land, consisting of Evergreen Shrubs, including many superb Specimens of Scarlet Hybrid Rhododendrons, Ornamental Trees and Shrubs, standard and trained Fruit Trees, standard and dwarf Roses, Hothouse, Greenhouse, and Herbaceous Plants, &c. This Stock is well worthy the attention of Gentlemen and others intending to plant this season, as it is well grown, has been repeatedly removed, and is in fine healthy condition. Also, a large Conservatory, three Hothouses, a large Nine-light Brick Pit, Frames, Hand Glasses, &c., full particulars of which will be in the Catalogue, which may be had at the Nursery; at the Seed Warehouse, 12, St. George's-crescent; from the Auctioneers, Leytonstone, Essex; or free by post on receipt of six postage stamps.

N.B.—Arrangements may be made to leave the Purchases on the Ground for some months, free of expense, to suit the convenience of parties who may not be prepared for planting.

FREE TRADE IN BULBS AND PLANTS.

MR. J. RAWLINGS will Sell by Auction, at the Mart, Bartholomew-lane, on TUESDAY, Oct. 14, and following days, at 12 o'clock, the first portion of a large consignment of DUTCH BULBS, comprising the finest double and single Hyacinths, Narcissus, Tulips, Anemone, and Ranunculus, in 50 fine named sorts; all the new sorts of Crocus, Jonquils, Snowdrop, Gladiolus, Lily, &c. The finest varieties of Ghent Azaleas, Rhododendrons, &c., in cultivation, in fine condition for potting, being beautifully furnished with bloom buds. Standard, Dwarf, and Pillar Roses, including some fine specimens worked with four varieties, and a quantity of Moss and others, fine for potting. Also a collection of Lancashire Gooseberries, Hardy Heaths, Large Yuccas, and the new varieties of Strawberries, such as Myatt's New Early Surprise, and Eleanor, Willmott's Prince Arthur, Kitley's Goliah, &c. &c.—May be viewed the morning of Sale, and Catalogues had at the Mart, and of the Auctioneer, 50, Hoxton-square, and Ebenezer Nursery, Shacklewell.

N.B. On Thursday the lots will be particularly arranged for the convenience of large purchasers.

WANDSWORTH COMMON.
TO NOBLEMEN, GENTLEMEN, NURSERYMEN, BUILDERS, AND PUBLIC COMPANIES, ENGAGED IN PLANTING.

MR. J. RAWLINGS will submit to public competition, by Auction, on the premises, Wandsworth Common (five minutes' walk from the Clapham station, and a quarter of an hour's walk from the Wandsworth station, on the South-Western Railway), on MONDAY, October 20, 1851, and ten following days, at 11 o'clock each day (by order of Mr. Robert Neal, in consequence of the ground being immediately required for other purposes), the whole of the valuable NURSERY STOCK, consisting of a considerable quantity of very fine Evergreens, Fruit and Forest Trees; New, Ornamental, and Deciduous Shrubs, &c.; many thousands of American plants, comprising fine scarlet and other Rhododendrons, Azaleas, Kalmia, Andromeda, Magnolia, &c.; a fine collection of Pinus, Standard and Dwarf Roses, and well-established plants in pots, of Clematis azurea grandiflora and flammula, Irish Ivy, Virginian Creeper, Bignonia, Choice Camellias, Chrysanthemums, &c. Also a large new 17-light Pit, 12 000 Bricks, a quantity of useful Timber, Paving Stones, and excellent Stone for Building. 400 loads of Rich Mould, a quantity of Garden-pots, &c.—May be viewed prior to sale. Catalogues (1s. each, returnable to purchasers), may be had on the premises, of the principal Seedsmen, and of the Auctioneer (post paid on application), 50, Hoxton-square, and Ebenezer Nursery, Shacklewell, London.—The whole of the Nursery Stock is in excellent condition, and having been planted within the last three years, may now be removed with the greatest safety.

FULHAM-ROAD.—TO NURSERYMEN, BUILDERS, AND OTHERS.

MR. D. A. RAMSAY will sell by Auction, at the Brompton Auction Ground, Fulham-road, Brompton, on TUESDAY, November 11, and following day, at 12 o'clock, an assortment of Deciduous and Ornamental Shrubs and Trees, Rhododendrons, Azaleas, and other American Plants, Evergreens, Climbers, &c. &c. May be viewed prior to Sale, and Catalogues had, at the principal Seed Shops, and of the Auctioneer, Brompton Nursery, Fulham-road, Brompton.

CHELSEA.—SECOND PORTION OF THE VALUABLE NURSERY STOCK.

MR. D. A. RAMSAY will submit to public competition, on the premises, King's-road, Chelsea, on TUESDAY, October 28, and following day, at 12 o'clock (by order of Messrs. Dennis and Co.), the remainder of the Erections of Greenhouses, Garden Frames, and Lights, Greenhouse Plants of choice varieties, a fine collection of Aloes, Cacti, &c., lately removed from the Great Exhibition, fine Evergreens of various sizes, Crimson Rhododendrons, choice Yuccas, Climbers, in pots, Dwarf and Pillar Roses, and a collection of Pæonias, Scilla, and other Bulbs.—May be viewed prior to sale, and Catalogues had, on the premises, at the principal Seed Shops, and of the Auctioneer, Brompton Nursery, Fulham-road.

NEW BROMPTON.
TO NURSERYMEN, MARKET GARDENERS AND OTHERS.

MR. D. A. RAMSAY has received instructions to Sell by Auction, on the Premises, Park Walk, New Brompton, on TUESDAY, Nov. 4, at 12 o'clock, by order of Mr. SALMON, the STOCK of a Market Gardener, comprising a Market Cart, Horse and Harness, Garden Frames and Lights, Baskets, Ladder, a Heap of Manure, and a large quantity of strong Moss Roses. Also an assortment of American Plants, Deciduous Shrubs, and Ornamental Trees, the property of a country nurseryman.—May be viewed one day prior to Sale, and Catalogues had on the Premises; and of the Auctioneer, Brompton Nursery, Fulham-road.

PARTNERSHIP.—The Proprietor of an old established, extensive, and increasing business in the NURSERY AND SEED TRADE, in the principal town of the South of England, contemplating retirement, is desirous of taking an active partner; one acquainted with the business would be preferred, and from whom a less premium would be expected. Not less than 2000*l.* would be required, for which an immediate return from the proceeds of the business of the forthcoming season would be guaranteed. None but persons of responsibility need apply, or will be treated with.—Apply to T. M. CATTLIN, Esq., 39, Ely-place, Holborn, London.

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

TO BE LET.—FAMILY RESIDENCE AND FARM of 219 acres, on the Brighton Railway, and only one and a half hour's ride from London and Brighton. To be let at a very low rent, with the shooting; a singularly beautiful and healthy situation. The house contains eight chambers, two sitting-rooms, and offices. The farm buildings are remarkably good and mostly new, and include two cottages for labourers. The fields lie together and open, and the land, which is chiefly arable, has had the benefit, in the last seven years, of a very large outlay in draining and other permanent improvements; altogether it offers superior family accommodation, with a cheap and eligible opportunity for farming. For particulars and conditions, and cards to view, apply to Messrs. DAVIS and VIGERS, Land Agents, 3, Frederick's-place, Old Jewry, London.

TO BE LET, ON LEASE, at a Corn-rent, by Tender, and entered upon at Lady-day next, a most desirable FARM, situate in the parishes of Coleshill, Berks, and Ingleshame, Wilts, the property of the Right Hon. the Earl of Radnor. This Farm consists of 366A. 2R. 1P. of very rich and valuable Meadow, Pasture, and Arable land, and has upon it an excellent Residence, &c.; any farther information may be obtained from Mr. MOORE, Coleshill, Highworth, who will appoint a person to show the farm, and by whom tenders will be received, on or before the 22d of November next. The corn-rent will be calculated at a seven years' average on the prices of Wheat, Barley, and Oats, variable from year to year, as under the Tithe Commutation Act. The Tenders should specify the length of lease for which the tender is made. The highest tender not necessarily accepted; regard will be paid to the character, intelligence, and capital, of the persons tendering; respecting which, unquestionable references will be required.

In One Volume, fcp. 8vo, price 6*s.* cloth, the 4th Edition, corrected and improved.

RIVERS'S ROSE AMATEUR'S GUIDE; containing ample Descriptions of all the fine leading Varieties of Roses, regularly classed in their respective Families; their History and Mode of Culture.

"Mr. Rivers is the best authority on the cultivation of the Rose."—*Gentleman's Magazine.*

London: LONGMAN, BROWN, GREEN, and LONGMANS.

And, on the same day, by the same Author,

CHRONICLES and CHARACTERS of the STOCK EXCHANGE. Second Edition. 8vo, 12*s.* cloth.

By the same Author, recently published,

THE HISTORY of the BANK of ENGLAND; Its Times and Traditions. Third Edition. 2 vols. post 8vo, 21*s.* cloth.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

SEEDLING CINERARIAS.

W. P. AYRES has the pleasure to inform his Friends that he has a few sets of the following select CINERARIAS, all of which he flatters himself will be found worthy of his commendation. They are now ready for delivery, and will be forwarded upon application. The usual discount to the Trade.

ORPHEUS.—A bright lilac purple flower, of fine form, the petals being broad and nearly free from serrature, and slightly inclined to cup. In habit the plant is first-rate, being dwarf, and produces side branches with great freedom; height, 9 inches. It obtained a Certificate at the National Floricultural Society in April, 1850, and was much admired by all who saw it. 10*s* 6*d*.

MAGNUM BONUM.—A very large flower, of lilac purple colour, and with petals of fine form and great substance; habit fine and unusually robust, and will be found admirably adapted for exhibition, as it will, with proper arrangement, form a specimen of very considerable size; height, 15 inches. Exhibited at the National Floricultural Society in April. 7*s* 6*d*.

VILLAGE QUEEN.—This is a flower in the way of Madame Mielliez, but superior to it; the colour is white with blue disc, and a lavender blue margin; the petals are broad, and their only fault is that of reflexing slightly at the points. The plant is of good habit and very free; height, 1 foot. 5*s*.

IAGO.—A dwarf and very distinct variety, the colour quite new; the flowers are small and abundantly produced, forming a very compact head; colour, heavy violet purple, bright, and very unusual; height, 9 to 12 inches. 5*s*.

GUSTAVUS.—A clean white flower, nicely contrasted by a bright purple disc, and deep lilac edge; the form is good, and the petals broad and of good substance; habit fine and robust; height, 9 inches. 5*s*.

UNIQUE.—A rich dark azure blue flower, with fiery disc and centre; the flower is of medium size, and the petals of good substance; habit free, bushy, and robust, and the flowers are produced very abundantly; it will make a fine specimen, and will be found quite distinct. 5*s*.

W. P. A. has also a good stock of the leading named kinds, which he can offer at the following prices:

| | | | |
|---|---|---|---|
| 12 distinct and showy kinds | ... | ... | 12*s.* 0*d.* |
| 12 superior do. | ... | ... | 21 0 |
| 12 very fine, fit for exhibition | ... | ... | 30 0 |

Cash or Post-office order.

Brooklands Nursery, Blackheath, London.

NEWPORT NURSERY GROUNDS, ISLE OF WIGHT.

WILLIAM WILKINS, NURSERYMAN and FLORIST, invites the attention of the Public to his very large and choice collection of Fruit and Forest Trees, new Coniferæ, Evergreen and flowering Shrubs, American Plants, Standard and Dwarf Roses, &c., which by periodical removals are prepared for planting out, so as to insure success, the whole of which he will supply on very moderate terms. Greenhouse and Herbaceous Plants in great variety, Geraniums, Verbenas, Heliotropes, Cupheas, Salvias, Fuchsias, Carnations, Pansies, Pinks, Petunias, and other Bedding-out Plants, Dahlias and Florists' Flowers, Raspberry, Strawberry, Rhubarb, Asparagus, Artichoke, Celery, Cauliflower, Herb and Seakale Plants, Russia Mats, Thorn Plants for Fencing, of prime quality, at very low prices.

W. W. having declined the Seed business, has been enabled to give his exclusive attention to the propagation of the large stock now growing in fine and healthy condition in his Nursery, and all orders with which he may be favoured will receive prompt and careful attention, so as to merit a continuance of that distinguished patronage he has for so many years enjoyed, and for which he returns his sincere thanks.

DUTCH HYACINTHS, per doz., 6*s.* to 12*s.*
Or an assortment of three dozen, best sorts, for 16*s.* 6*d.*

LARGE MAJOR WHITE ROCKET, 15*s.* per 100, 2*s.* 6*d.* per dozen.

HERBACEOUS PLANTS, finest collection, 30*s.* per 100, 4*s.* per dozen.

Catalogues of Roses, &c., can be had for one stamp. Excellent assortment of Fruit Trees, Shrubs, &c.

DILLISTONE and Co., Sturmer Nurseries, Halsted, Essex.

EXOTIC NURSERY, KING'S-ROAD, CHELSEA. We have a fine stock of ARAUCARIA IMBRICATA, CEDRUS DEODARA, RHODODENDRON PONTICUM, in remarkably well-grown plants, of various sizes. This being the best time of the whole year for planting them, we beg respectfully to recommend them in an especial manner, to those who intend embellishing their estates and gardens by ornamental planting, and shall be happy to furnish size and price when applied for. KNIGHT and PERRY.

TO FLORISTS, AMATEURS, AND GARDENERS.

M. WOOLLARD begs most respectfully to announce her intention to dispose of the entire Stock of FLORIST FLOWERS belonging to her late husband, consisting of a large collection of fine healthy plants of Auriculas; a very valuable collection of Ranunculuses; and all the new and best varieties of Carnations, Picotees, and Pinks.

Royal William Inn, Ipswich, Suffolk.

HOLLYHOCKS, PINKS, AND PANSIES.

J. CHATER AND SON'S Catalogue of the above Flowers, in which will be found most of the best varieties in cultivation, may be had on application to JOHN CHATER and SON, Nurseries, Haverhill, Suffolk. Also may be had, for 20*s.*, carriage free to London, 12 pairs of new and choice Pinks; 12 new and choice Pansies; 6 fine show Hollyhocks; fine double mixed Hollyhocks, 30*s.* per 100; Hollyhock and Pansy Seed, 2*s.* 6*d* per packet.

TWENTY GERANIUMS FOR ONE POUND.

TWENTY CHOICE NAMED GERANIUMS FOR TWENTY SHILLINGS, can be selected by the purchaser from the following list:—Foquett's Magnificent, Topping's Brilliant, Hoyle's Crusader, Arnold's Virgin Queen, Falstaff, Lyne's Forget-me-not, Delicatissima, Rosy Circle, Nourmahal, Desdemona, Sir Robert Sale, Hebe's Lip, Centurion, Negress, Cassandra, Pluto, Symmetry, Gustavus, Gulielma, Sunrise, Duke of Cornwall, Grandiflora, Orion, Black Prince, Mercury, Star of the West, Lady Ebrington, Jenny Lind, Scarlet Defiance, Flora's Flag, and Emilia.

SCARLET GERANIUMS.

Flower of the Day, Excellence, Glendinning's Perpetual, Magnum Bonum, Queen of Summer, Fire Queen, Royalist, Commander-in-Chief, Resilium, Hendersonii, Monarch, Britannia, and General Tom Thumb.

*All Orders above 2l. will be delivered Carriage Free to any Station on the Great Western, Bristol and Exeter, or South Devon Railways, or to Cork, Dublin, or Belfast.*

Apply to WILLIAM E. RENDLE, Union-road, Plymouth, adjoining the terminus of the South Devon Railway.

THE FINEST NEW ROSES OF THE SEASON.

HYBRID PERPETUAL QUEEN VICTORIA (PAUL'S).—This is unquestionably the finest New Rose of the season; it is a seedling from "La Reine," of which it is so exact a copy in every respect, save colour, that it has been designated by some the "WHITE LA REINE." The ground colour is white, overlaid with the most delicate hue of pink, perfectly wax-like in appearance, and distinct from every other. Plants, in November, 10*s.* 6*d* each, with the usual discount to the Trade when three are ordered at once.

CLIMBING PERPETUAL ROBERT BURNS (PAUL'S.)—Flowers light vivid carmine, sometimes edged with purple, large, equal to Chenedole in colour; like it not very double, but possessed of the additional advantage of flowering in the autumn. Desirable on account of its distinct and glowing colour, and a splendid autumnal climber. Plants, in November, 7*s.* 6*d.* each.

N.B. Each of these Roses has obtained a 1st Class Certificate from the National Floricultural Society; the former has also received the same from the Royal South London Floricultural Society. Also a fine collection of Hollyhocks now in bloom.

*** Further orders for the Roses can only be taken for plants in bud.

A. PAUL and SON, Nurserymen, Cheshunt, Herts.

HOLLYHOCKS.

JAMES KITLEY having a large Stock of fine double HOLLYHOCKS, consisting of about 40 varieties of all colours mixed, begs to offer them at 4*s.* per dozen; named to colour, 6*s.* per dozen; best show varieties, 2*s.* 6*d* each; fine double German varieties, very beautiful, 12*s.* per dozen. Hollyhock Seed, mixed, 2*s.* 6*d.* per packet, post free.

J. K. has also fine border Carnations and Picotees mixed, at 4*s.* per dozen; Single Russian Violets, 3*s.* per dozen; double do., 4*s.* per dozen; Neapolitan do., 3*s.* per dozen. A Post-office order required from unknown correspondents.

Lyncombe Vale Nursery, Bath, Oct. 18.

CARTER'S CATALOGUE OF BULBS.

J. CARTER, SEEDSMAN and FLORIST, 238, High Holborn, London, respectfully informs his customers, that his new Catalogue of Dutch Flowering Bulbs will be sent, gratis, and pre-paid, on application. The following South American Bulbs, among which novelties may be anticipated, arrived too late for insertion. They may be had at the annexed prices.

*** Parties taking 50, 25, or 12 Bulbs, will be charged at the same rate as the price per 100. October and November are the best months for planting. Anemones and Ranunculus require a little protection in winter.

JAMES CARTER, Seedsman and Florist, 238, High Holborn, London.

G. RUSSELL, 20, Sussex Road, Brixton, Surrey, has the following for sale:— Per 100.—*s. d.*

| | | |
|---|---|---|
| 1000 Evergreen Oaks, 2 year plants ... ... ... ... | 4 | 0 |
| 2000 Evergreen Oaks, 1 year plants ... ... ... ... | 3 | 0 |
| Either fit for Potting, Planting, or making Hedges. | | |
| 3500 Privets, 2 year plants ... ... ... ... ... | 10 | 0 |
| 15 doz. Gooseberry and Currant, 3 year plants, per doz. | 1 | 0 |

JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester, respectfully informs Florists, &c., that he is this season selling out his three superb Seedlings, which he thinks will give satisfaction to purchasers, viz.:—

EARL OF WILTON.—Purple flake, fine clear white, well ribboned with purple, long pod and full flower; 10*s.* 6*d.* per pair.

COUNTESS OF WILTON.—Heavy purple Picotee, superb flower, large size, fine form, clear white, without spot or bar, purple heavily laid on; 10*s.* 6*d.* per pair.

FANCY PICOTEE, "COUNTESS OF ELLESMERE."—The most superb variety ever offered, and quite a new style of flower; its marking consists of myriads of minute ticks of purple lake on a delicate blush ground; petals quite smooth on the edge; 3*s.* 6*d.* per pair.

For further description, see his Catalogue, which will be sent on prepaid application, containing priced lists of Auriculas, Alpines, Polyanthus, Primroses, Carnations, Picotees, Pinks, Pansies, and the Lancashire Show Gooseberry Trees.

Copies supplied on application, published complete with the newspaper stamp, to go free.

Seed and Horticultural Establishment, Sudbury, Suffolk.

SANGSTER'S NEW EARLY No. 1 PEA.

HAY, SANGSTER, AND CO., in submitting the above valuable PEA to the public, can recommend it with the greatest confidence, as the largest podded and best Early Pea known, and of first-rate quality; height, 2 feet. Price 2*s* 6*d.* per quart.

York Regent Potatoes, from prepared cuttings, 6*s.* per bush. Cambridge Radical do. (a first-rate second early) 6*s.* do. Early Oxford do., 10*s.* 6*d.* do. Early Ebrington Kidney do., 10*s.* 6*d.* do. Early Ash-leaf Kidney do., 10*s.* 6*d.* do.

Post-office orders to be made payable at the Borough Post-office to HAY, SANGSTER, and Co., Nursery and Seedsmen, Newington Butts, London. One-bushel hampers and booking, 1*s.* 6*d.*; two-bushel, 2*s.* 6*d.* Sacks, 2*s.* 6*d.* each.

THE MOUNTAIN OF LIGHT, a new variegated GERANIUM, of dwarf habit, and free growth. The centre of the leaf is deep green, with a broad margin of pure white. The truss is of medium size, the pips very round, and the colour the most intense scarlet. It is a very free bloomer.

First-class Certificates have been awarded to it by the National Floricultural Society, and the South London.

JOHN AND CHARLES LEE intend sending out this desirable variety (which eclipses all former introductions in this class), on the 31st instant. Price 10*s.* 6*d.* each. Early orders are requested, as the stock is limited.

Nursery, Hammersmith.

SUPERB HOLLYHOCKS.

R. B. BIRCHAM, Hedenham Rosary, Bungay, Suffolk, begs to state that his Descriptive CATALOGUE of the above splendid flowers is now ready, containing all the best in cultivation, and including some first-rate Seedlings.

R. B. B. begs to offer strong ground roots, selected when in bloom, from some thousands of seedlings; these are fine double flowers and splendid colours, and will prove a superior class of flowers for the border and shrubbery; 9*s.* per dozen.

A Descriptive Catalogue of the best Roses in cultivation, including upwards of 300 of the best hardy varieties. R. B. B. will be happy to forward the above lists on prepaid application. Package carefully attended to; extra plants included, to compensate for distant carriage. Carriage paid to London per Norfolk railway.

SUPERB NEW PEA.—THE "NOVEMBER PROLIFIC," supersedes all other varieties, yielding a crop of extraordinary abundance, stands the severe weather better than any others. It is of the richest flavour, and may be sown from November to July without missing a crop. Price 2*s.* 6*d.* per quart; to be had from W. HAMILTON, Seedsman, &c., 156, Cheapside, London.

☞ A liberal discount to the Trade.

RED LODGE NURSERY GROUNDS, North Stoneham; SEED WAREHOUSE and FLORICULTURAL GARDENS, No. 181, High-street, near the Bar Gate, Southampton.

W. ROGERS, SEN., NURSERYMAN and CONTRACTING PLANTER, begs to inform the Public and those interested in Planting that he intends selling at very reduced prices, the fine Stock of FRUIT, FOREST, ORNAMENTAL TREES and SHRUBS (extending over 60 acres of land) in the forthcoming planting season, priced catalogues of which may be had, wherein will be enumerated all the newly-introduced hardy CALIFORNIAN and CHINESE SHRUBS, CONIFERÆ, RHODODENDRONS, and ROSES, which are added to the stock and cultivated as soon as they appear, it being his determination that these old-established nursery grounds shall continue to merit the patronage of the nobility and gentry so liberally conferred upon him for the last 40 years.

A Gardeners' and Land Stewards' Registry is kept at his office in the town, where men of experience and ability may be always obtained.

The following will be found particularly fine, and in great abundance:—Larch, Scotch Spruce, Pinaster, and Sea Pine, Fir, Hazel, Oak Quicksets, Mahonia (for cover), and Rhododendrons of all sizes, from 4 inches, 40*s.* per 1000, to 2, 3, and 4 feet, 10*s.* to 30*s.* and 40*s* per 100; Abies Douglasii, 2 feet, 30*s.* per dozen, and 2 to 3 inches, 5*l.* per 100, or 18*s.* per dozen. Double Camellias, 12*s.* per dozen; Single Camellias, fit for working, 30*s.* to 40*s.* per 100; Dwarf Boursault Rose stocks (strong), 6*s.* per 100.

EDWARD GEORGE HENDERSON is now ready to send out his new CINERARIAS and FANCY GERANIUMS, for which he solicits early orders, as the stock of some of the varieties is very limited.

Black Hamburgh and Sweetwater Vines, in pots, fruiting plants, fit for forcing, 5*s.* each. Discount to the trade.

Nurseries, Kingston, Surrey, Oct. 18.

TULIPS, HYACINTHS, RANUNCULUSES, ANEMONES, LILIUM LANCIFOLIUM, AND DUTCH BULBS.

HENRY GROOM, Clapham-Rise, near London, by appointment, FLORIST TO HER MAJESTY THE QUEEN, AND TO HIS MAJESTY THE KING OF SAXONY, begs to recommend to the attention of the Nobility, Gentry, and Amateurs, his extensive collection of the above FLOWERS, which he can supply at very moderate prices. He begs to say, that he has received his usual assortment of Hyacinths and Dutch Bulbs, in excellent condition, and that his Catalogue will be forwarded by post, on application. This is the best season to make a selection of Bulbs.

READING NURSERIES.

CHOICE FRUIT TREES, CONIFERS, PERPETUAL ROSES, CARNATIONS, PICOTEES, &c., CARRIAGE FREE.

SUTTON'S PRICED CATALOGUE, containing descriptions of the foregoing, and much useful information to gentlemen who intend planting, may be had, gratis, on remittance of two penny stamps for postage.

Reading Nurseries, Oct 18.

VIOLETS.

TILEY'S VIOLA ARBOREA, or PERPETUAL TREE VIOLET (true).—In answer to numerous inquiries for the above, and great satisfaction given by the plants sent out last season, by Edward Tiley, he begs to state that he has this year a fine stock of the above beautiful Double Violet now to dispose of, which he can highly recommend, this being the proper time for making beds or potting. They are beautifully scented; the blooms are as large as the Double Blue Hepatica; they bloom freely from August till the end of May, and are perfectly hardy. Twelve of these plants grown in pots will scent a large greenhouse; and a small bed, 9 feet long by 3 feet wide, will be sufficient to furnish a family with bouquets, the whole of the winter and the spring. They should be planted in rather a dry situation and a loose soil, as the Violet will thrive and bloom finer than in wet or clay borders.

E. T. has been informed by the gentleman that introduced it into this country, that he has seen them growing in the thickets of Persia to the height of 4 feet, with large bushy heads to them, and hundreds of blooms on them at the same time. Large bushy plants, 6*s.* per dozen; smaller ditto, 3*s.* per dozen, or 1*l.* per 100. Any quantity of the above will be sent postage and package free.

STRAWBERRY PLANTS.

The undermentioned first-rate varieties are now ready to send out:—

Myatt's Surprize, sent out first time last season, 1*l.* per 100, or 3*s.* per dozen.

Prince Arthur, do. do., 1*l.* per 100, or 3*s.* per dozen.

Myatt's Eleanor, the best and latest bearing Strawberry in cultivation, 5*s.* per 100.

Goliah, very fine ... ... ... ... 3*s.* per 100.
British Queen, do. ... ... ... 5*s.* ,,
Alice Maud, do. ... ... ... ... 3*s.* ,,
Black Prince, very early ... ... 5*s.* ,,
Prolific, very fine and early ... ... 5*s.* ,,

Cremont's Perpetual, or double-bearing Strawberry, 12*s.* per dozen, or 4*l.* per 100.

Trollop's Victoria, 12*s.* per dozen, or 4*l.* per 100.

The above are strong and well-rooted plants, such as will insure satisfaction. Any of the Strawberries that are priced, per dozen, can be sent free by post; also those priced, per 100, will be sent package free.

Fine Giant Scarlet Brompton Stocks, Plants that have been all pricked out, 2*s.* 6*d.* per 100.

Also, some fine Antirrhinums, all saved from striped and spotted varieties, such as will give every satisfaction, and bloom early next spring, 5*s.* per 100.

Fine Sweet Williams, such as will bloom next season, saved from 50 distinct varieties (the plants are strong and good), 5*s* per 100, or 1*s.* per dozen. Can be sent by post with any of the above.

WINTER CUCUMBER.

Lord Keynon's Favourite, the best variety for winter cultivation, 2*s.* 6*d.* per packet.

A remittance is expected by Post-office order, or the amount in penny postage stamps.

Edward Tiley, Nurseryman, Seedsman, and Florist, 14, Abbey Churchyard, Bath, Somersetshire.

GLASS FOR CONSERVATORIES, &c.

HETLEY and Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to James Hetley and Co., 35, Soho-square, London.

See the *Gardeners' Chronicle* first Saturday in each month.

HARTLEY'S PATENT QUARRY GLASS, FOR GLAZING CHURCHES, CHAPELS, SCHOOLS, &c.—The above beautiful description of Glass is an adaptation of Hartley's Patent Rough Plate Glass, with a diamond (or quarry pattern); thus avoiding the use of window leads entirely.

Being in single plates, it is impervious to rain, and causes perfect freedom from draughts, which, coupled with its thickness, tends to create an uniformity of temperature within the building. Attention is also directed to its durability, non-transparency, and cost; for, although three times the thickness of crown glass, the one-eighth thick costs less than common lead lights; we can, therefore, with confidence recommend it as an economical, useful, and beautiful article for the glazing of churches, chapels, schools, &c., &c.

Prices to be had and samples to be seen at James Phillips and Co.'s, 116, Bishopsgate-street Without, London.

GLASS.

THOMAS MILLINGTON'S FOREIGN SHEET GLASS is far superior to any other manufacture, as well as cheaper. In 100 feet boxes packed for immediate delivery.

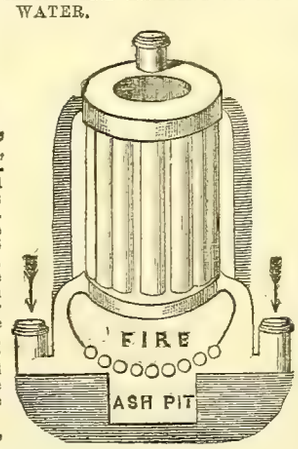
| | | | | | |
|---|---|---|---|---|---|
| 6 inches by 4 and | 6½ | by 4½ | ... ... ... | 13*s.* | 0*d.* |
| 7 ,, | 5 and | 7½ | by 5½ ... ... ... | 15 | 0 |
| 8 ,, | 5 and | 8 | by 5½ ... ... ... | 15 | 0 |
| 8 ,, | 6 and | 8½ | by 6½ ... ... ... | 17 | 6 |
| 9 ,, | 7 and | 10 | by 8 ... ... ... | 20 | 0 |
| 12 ,, | 10 and | 13 | by 9 ... ... ... | 20 | 0 |

And many other sizes, or cut to order in various thicknesses.

Cases containing large Sheets, in 100, 200, and 300 feet, at 21*s.* per 100 feet.

ROUGH PLATE, perfectly flat, ⅛ in. thick, best manufactured.

In sizes under 15 inches ..... 6*d.* per foot.
,, ,, 35 ,, ..... 8*d.* ,,
,, ,, 50 ,, ..... 9½*d.* ,,
,, ,, 75 ,, .....12*d.* ,,

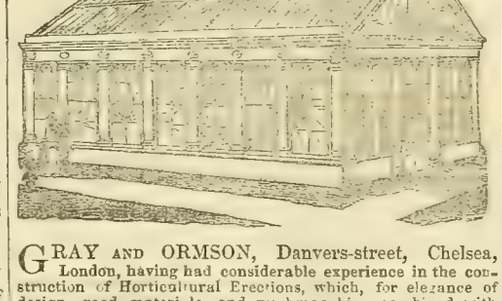


Milk Pans, 2*s.* to 6*s.* each; Metal Hand-frames, Glass Tiles and Slates; Cucumber, Propagating, and Bee Glasses; Wasp Traps, Glass Shades, and Plate Glass, at 87, Bishopsgate-street Without, same side as Eastern Counties Railway.—Established 100 years.

GREEN AND HOTHOUSE BUILDER.—Green and Hothouses made by Machinery, sent to all parts of the United Kingdom. These Horticultural Buildings are warranted to be made of the best materials, and the cheapest in England. Lists of prices post free. 1½ in. greenhouse lights, 2½*d.*; 1⅝ in. ditto, 3*d.*; 2 in. ditto, 3½*d.* per foot; if glazed with 16 oz. sheet-glass of a large size, 4*d.* per foot extra.

J. Lewis, Horticultural Works, Stamford-hill, Middlesex.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.



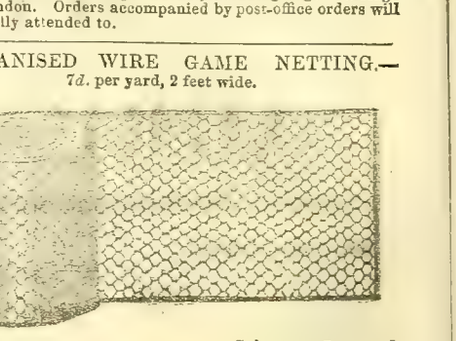
J. Weeks and Co., King's-road, Chelsea, CHALLENGE the whole world to make a Boiler that will produce anything like the same effect, with the same quantity of Fuel, in a given time. It is one of these Boilers that warms the water of their Victoria Regia Tank, which contains 9000 gallons, and also heats several large Forcing-houses and ranges of Pits, with a small consumption of fuel.

J. WEEKS AND Co., King's-road, Chelsea, Horticultural Architects, Engineers, and Builders. These Boilers are very powerful, durable, and economical. The fire warranted to last 15 hours without attention. The Furnace Bars are Hollow Tubes, through which the return water passes before entering the upper part of the Boiler, thereby causing a very rapid circulation, and producing double the effect from the same quantity of fuel.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. Weeks and Co., King's-road, Chelsea, London.

WARMING AND VENTILATING FOR CHURCHES, CONSERVATORIES, AND OTHER BUILDINGS.—The most efficient and economical Hot-water Apparatus, supplied and erected for the above purposes, fitted with improved boilers, requiring no brick-work, capable of working 14 hours without attention. Also the THERMANTERION, a cheaper and simpler apparatus, especially adapted for buildings only used occasionally.—Apply to Spiller and Tayler, Battersea, near London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER, AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP



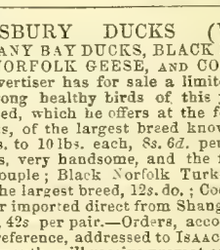
GRAY AND ORMSON, Danvers-street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are now in a position to execute orders on the lowest possible terms.

G. & Co. have been extensively employed by the Nobility, Gentry, and London Nurserymen, and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-Water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

KESSINGLAND WHEAT.—Persons desirous of cultivating this productive and new variety of Wheat, can obtain it by applying to William Griffin, Eydon, Daventry, who is sending it out in quantities not less than half quarters, at the rate of 6*s.* per bushel, including bags. Carriage paid to London. Orders accompanied by post-office orders will be punctually attended to.

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.



| | | Galvanised. | Japanned Iron. |
|---|---|---|---|
| 2-inch mesh, light, 24 inches wide ... | | 7*d.* per yd. | 5*d.* per yd. |
| 2-inch ,, strong ,, ... | | 9 ,, | 6½ ,, |
| 2-inch ,, extra strong ,, ... | | 12 ,, | 9 ,, |
| 1½-inch ,, light ,, ... | | 8 ,, | 6 ,, |
| 1½-inch ,, strong ,, ... | | 10 ,, | 8 ,, |
| 1⅝-inch ,, extra strong ,, ... | | 14 ,, | 11 ,, |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised sparrow-proof netting for Pheasantries, 3*d.* per square foot. Patterns forwarded post free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

FARM AND COTTAGE PUMPS.

N.B.—Transparent Sheeting, nearly 2 yards wide, 1*s.* per yard. One thousand yards thick Tarpauling, second-hand, 1*s.* per square yard, made up.

NEW SHOW ROOMS FOR BEDSTEADS.

HEAL AND SON have erected some extensive Warerooms for the purpose of keeping every description of Bedsteads. In Iron their stock will include every sort manufactured, from the cheap Stump, for servants' use, to the handsomely ornamented tubular-pillared Canopy, as well as Brass Bedsteads of every shape and pattern; and in wooden Bedsteads their Rooms are sufficiently extensive to allow them to fit up a variety, both in Polished Birch and Mahogany, of Fourpost, Canopy, and French, and also of Japanned Bedsteads—in fact, to keep in Stock every sort of Bedstead that is made; and they have also a general assortment of Furniture, Chintzes, Damasks, and Dimities, so as to render their Stock complete for the Furnishing of Bedsteads as well as Bedding. And without attempting to compete with the prices at which the lowest class of Furniture is sold, and which is fit for no useful purpose, their new Stock will be found to be priced on the same principle by which their Bedding trade has, during the last 30 years, been so successfully extended, and the goods, whether of a plain and simple pattern, or of a handsomer and more expensive character, are of well-seasoned materials, sound workmanship, and warranted.

Heal and Son's list of Bedding, containing full particulars of Weight, Sizes and Prices of every description of Bedding, sent free by post on application at their Factory,

196 (opposite the Chapel), Tottenham Court Road, London.

PINE PLANTS FOR SALE.—The different varieties of BLACKS and QUEENS, warranted clean and well rooted.—Apply to W. DAVIES, Starch Green, Hammersmith, near London.

AMBROISE VERSCHAFFELT, NURSERYMAN Guent (Belgium), has just published his new List of Plants, and may be had *free* at Mr. R. SILBERRAD's, 5 Harp-lane, Great Tower-street, London. A. V. begs to offer to the trade fine Camellias and Azalea indica, full of flower buds, and at a very moderate price.

NEW STRAWBERRIES.—Triomphe de Gand, 5*s*. per doz. Merveille de Flandre. 5*s* ditto; Honneur de la Belgique, 2*s*. each: Duc de Brabant 2*s* each; Comte de Flandre, 2*s* each.

DUTCH HYACINTHS for Forcing, 3*s*. 6*d*. per dozen; Best do., for Glasses, 6*d*. to 1*s*. each Double Roman and Paper-white Narcissus, 4*s*. per dozen; Single and Double Due Van Thol Tulips, 2*s*. per dozen. Also Crocus, Iris, Jonquils, Narcissus, Anemones, and Ranunculus, of which a priced List may be had free, per post, from A. COBBETT, Italian and Foreign Warehouse, 18, Pall Mall, London.

GOLIATH STRAWBERRY.—A Post-office order for 5*s*. will secure (package free) 100 strong plants of this celebrated Strawberry, or 12 plants, free by post, on receipt of 18 postage stamps. Also TROLLOP'S VICTORIA, 4*l*. per 100, and any of the old varieties at very low prices. The usual allowance to the trade.—JAS. KITLEY, Lyncombe Vale Nursery Bath.

HOSEA WATERER'S Descriptive Catalogue of AMERICAN PLANTS, CONIFERS, ROSES, &c., for the ensuing Autumn, is just published, and may be had on application, enclosing two postage stamps, to Mr. HOSEA WATERER, Knap Hill Nursery, Woking, Surrey.

RENDLE'S LIST OF NEW GERANIUMS will be found in the columns of this Paper, page 578, in the Number for September 13, 1851.
WILLIAM E. RENDLE, Florist to her Majesty, Plymouth.

*The Hyacinths are particularly large and handsome. Most excellent kinds can be had at 6s. per dozen.*

THE AMERICAN NURSERY, BAGSHOT, SURREY.
JOHN WATERER begs to announce that he has just published a new CATALOGUE of Hardy Rhododendrons, Azaleas, Roses, Conifers, &c., and which may be obtained by enclosing two postage stamps.
*** The Colours of all the Rhododendrons worthy of cultivation are described; thus purchasers are afforded every facility in making selections.

VICTORIA REGIA.
J. WEEKS AND CO., King's-road, Chelsea, have great pleasure in announcing the complete success of this magnificent Aquatic, the Queen of the Lakes, GROWING IN THE OPEN AIR. The splendid flowers are now open every day, to the great admiration of all who see it. A few fine YOUNG PLANTS ARE NOW FOR SALE. Full instructions for its cultivation will be forwarded on application to J. WEEKS and Co., King's-road, Chelsea.

G. JACKMAN, NURSERYMAN, Woking, Surrey, (1½ mile from Woking Station, South-Western Railway), begs to announce that he has published a new and complete Catalogue of his American Plants, Ornamental Evergreens, Conifers, Flowering Shrubs, Standard and Dwarf Roses, Fruit and Forest Trees, &c., and may be had on application by enclosing two postage stamps.—Woking Nursery, Oct. 18.

**The Gardeners' Chronicle.**
*SATURDAY, OCTOBER* 18, 1851.

THE prevention of WEEDS ON GARDEN-WALKS is one of the questions which would seem to be incapable of solution, if we are to judge from the discordant opinions of practical people. Some years since sulphate of copper was strongly recommended as a deadly enemy to moss; solution of corrosive sublimate was also proposed, and salt, applied in various ways. But it was found that all these substances, however active at first, possessed but a temporary value, unless Mr. FLEMING's plan of applying salt boiling hot shall be found to stand everywhere the test of experience. However, gardeners maintain that, for the removal of weeds on walks, there is nothing like hand-labour.

But we are far from thinking that the resources of the gardener are exhausted by salt, blue vitriol, or corrosive sublimate. In fact, we know that asphalte walks properly prepared will become neither weedy nor mossy; and in asphalte, then, we have a friend to be relied upon. But asphalte is costly, and its appearance is disliked. To avoid the first inconvenience, a horticultural asphalte has been proposed, made from lime rubbish, sand, cinder-ashes, and gas tar; this, too, answers the purpose, but still remains offensive to some eyes. No weeds, however, will grow upon it. It is therefore worth enquiring what quality there is in horticultural asphalte to produce this result. It cannot be the lime rubbish, nor the sand, nor the cinder ashes; for all these are prolific in weeds of one sort or other. Perhaps it is the hardness of the substance; but asphalte walks are not so hard as sandstone or limestone, and both those materials rapidly become mossy. It would, therefore, seem to be the gas tar; and a question arises whether gas tar may not be advantageously used as a weed destroyer on walks, without the usual adjuncts. We know that pales painted with gas tar will bear neither lichen nor moss. We know more; we know that trees trained against such pales are very apt to be sickly till the smell of the tar is gone, or even to die in the meanwhile. Gas tar, then, is a foe to vegetable life.

Influenced by some such considerations as these, one of our correspondents, Mr. HARDY, Nurseryman, of Maldon, tried the following experiment: Twenty rods of walk, 4 feet wide, were cleared of weeds; first, by removing all the gravel, 4 inches deep, then by daubing two barrels of gas tar (value about 10*s*.) evenly over the surface, about half an inch thick, with a brush, and immediately replacing the gravel, which became completely incorporated with the tar. The walk was thus rendered firm and solid. The tar was found to prevent any weeds from growing through it, and only a few small ones were eventually seen to spring out of the gravel itself. The Box on the edge perished at the same time, if the gas tar was allowed to reach nearer to it than 2 inches. Here, then, a gravel walk was, to a certain extent (almost wholly), cleared of weeds, by a stratum of gas tar below the surface; and the walk itself retained its colour, without offending the eye by its blackness.

But, before this experiment became known to us, we had ourselves made some trials of gas tar in another way. Some black walks, constructed on a damp heavy clay, with cinder siftings, and similar materials, although perfectly drained, and in all respects well made, became so mossy in the winter months, that ladies could not walk upon them with comfort. The moss retained water like a green sponge, and days of winter sun were unable to dry it. It was therefore determined to coat the walks with a layer of gas tar, thick enough to cover the moss; but after the first trial, it was found that the cost was too great, and that the gas tar became sticky, as soon as it was warmed by sunshine, or even in ordinary dry weather. The application was, however, proved to stop the growth of weeds most effectually, for a piece of walk thus prepared nine months ago is as naked as it was on the first day of the application. Encouraged by this result, it was determined to *paint* the walks with gas tar, without disturbing the surface; and accordingly, a path in a shrubbery, about 4 feet wide, and rather more than 300 yards long, was thus treated, the tar being applied over moss and weeds, and while hot, on account of its greater fluidity. As soon as a few yards were painted, the workmen sifted sand upon the walk, and then ran a roller over it. The result was a firm, dry, hard walk; weeds refused to grow, moss disappeared, and there was no trace of the walk having been tarred; for the surface, where sanded, looked exactly like any other gravel walk. The quantity of gas tar required for the space above-mentioned was two barrels.

We believe that this trial will prove to have been perfectly successful: the experience of a winter is, however, required to determine how far the tarred surface will continue to resist the inroads of moss. We can only say that at present there is not the slightest trace of its appearance. In one respect the tar, by itself, is superior to imitations of asphalte, namely, that if broken up by frost, the first warm sun restores it to its previous condition, at the mere cost of a turn or two of the roller.

[WE have been favoured by Mr. GRIGOR, of Forres, with an excellent article on Arboriculture, for which we hope to find room in a week or two.]

ARTIFICIAL BREEDING OF FISH.—No. I.

As the amusement of fly-fishing is one which holds a first place in the opinion of every one who understands it; and as the trout and the salmon are the only fish which afford genuine sport to the angler; and as I believe that the latter, in the southern counties of England, is nearly extinct, whilst the former is there far from being abundant; I wish to call the attention of such of your readers as are possessed by the true piscatorial *furor*, to the facility with which these fish can be bred artificially; and as many experiments have been made by my directions, and I have witnessed the results, I beg to say that there is no fear of success, if due care is taken. The experiments of Sharr, Agassiz, &c., have proved that fish can be bred artificially (the experiments of Boccius I have not yet tried, although he professes to arrive at the same results in another manner); and acting on the plan recommended by them, I have known both trout and salmon bred by thousands for the last 10 years; and as now is the time for the experiments to be made, I hope that those who intend to try the plan will lose no time in looking after their supply of breeding fish.

To begin with trout: catch as many as you can conveniently obtain upon the spawning beds *, and examine them carefully one by one, to see that the spawn and milt are in a fit state for exclusion, and also to enable you to separate the males from the females. If they are in a fit state to be operated upon, which may be known by the facility with which the milt and roe run from them, on a slight pressure, squeeze the milt of the males into a little water. When you have obtained all the milt you can get, add so much water that the mixture remains slightly opalescent; say about equal in colour to a tablespoonful of milk mixed in a quart of water. Pour this into a deep dish or bowl, large enough to hold the largest of your female trouts. Take one of these, put it into the water so prepared, and gently squeeze the roe from it, whilst overhead in the water.* Do this as quickly as possible, and return the fish into fresh water, and then pour off the water containing the impregnated roe, through a strainer, carefully preserving it for the remaining fish, and immediately return the roe into fresh spring or brook water. Repeat the operation for every female trout, and you will then have a quantity of impregnated roe, which, if properly managed, will hatch with great certainty. Have ready as many boxes as you are able to stock with spawn, made 3 feet long, 2 feet broad, and 6 inches deep; fill them 2 inches deep with river sand, so well washed that there is not a particle of mud left in it, and upon that put 2 inches of gravel, also exceedingly well washed, and varying in size from a Hazel nut to a pigeon's or pullet's egg. These boxes must be so placed that the water from a spring will run into the first, and from the surface of that into the second, &c.; and below the whole nest of boxes, there ought to be a small reservoir made, say 3 yards by 2 ditto, and 18 inches deep, and well gravelled at the bottom; all these things having been previously arranged, and the water flowing nicely over the gravel, sprinkle the impregnated roe equally over the surface of the gravel, say a quarter of a pint to each box, and it will roll down the interstices of the gravel, and find a bed in which it will remain snugly until the spring, then, about March, if all has been properly managed, you will find, on a careful examination, that the young trouts are coming to life by hundreds.

I am very particular in recommending a spring, rather than a brook, for several reasons; in the first place, brooks are liable to be flooded, and are sometimes so overcharged with sand, mud, &c., that the gravel in the spawning boxes is completely choked with it, and the spawn is lost, as I know to my great and frequent disappointment; at other times all is washed away together. In the second place, the gravel of brooks swarms with water-lice, and the larvæ of aquatic flies, as well as bullheads and loaches, all of which prey upon the spawn of both the trout and the salmon; and in the third place, if you place your spawning-boxes in a brook, it is difficult to prevent the escape of the fry when hatched, and you are left in doubt as to the success of your experiment; with a spring all these inconveniences are obviated, but if your water-course should contain water-lice or aquatic larvæ, it is a very easy matter to destroy them before putting in your boxes, with a little quicklime. It is also desirable to cover your spawning boxes with a wire grating, and also to protect them in severe weather from the chance of being frozen. When they begin to hatch, open a communication between the boxes and the little reservoir below, and if this communicates with a water-course, in which aquatic plants are growing, so much the better; the fry, as soon as they are strong enough, will make their way into this ditch, and will find an abundance of food among the water plants; from thence they ought to be able to make their way into the brook, river, or lake, which it is intended to store with them; but all ducks, wild and tame, should be driven from this ditch, or there will be few trouts allowed to find their way to their final place of destination.

The above rules, with some modifications, are applicable to the breeding of salmon as well as trout, the only difference being in the mode of placing the female fish. The salmon is too large a fish to put into the vessel in which the diluted milt is placed; but I think it desirable that she should be held by an assistant in such a manner that the tail and lower part of the body, up to the vent, are immersed in the water containing the milt; it is also very necessary to hold her firmly, otherwise a large fish, in the struggles it makes to get free, is apt to upset the vessel containing the milt, and then the experiment is at an end; at least for the time; being held firmly by the assistant as above, the belly of the fish must be gently pressed by the hands, to promote the emission of the spawn, which on emission must be gently stirred in the water, to bring every grain of it into contact with the milt; but do not allow it to remain longer in that liquor than a minute, as I have found that if the diluted milt is too strong, or if the ova remain too long in contact with it, they become opaque and never hatch at all, apparently because they are over impregnated. In the ordinary way in which salmon and trout are bred, the milt must be largely diluted with water, and the contact between the milt and the ova can only be momentary; for the streams in which these fish spawn (particularly salmon) are so rapid that the milt on exclusion must be carried away immediately.

I am quite aware that there is another theory which assumes that impregnation takes place 12 months before emission; but a very careful examination of the spawn-

* I have frequently found, when catching trout for this purpose that the milt and roe were not ready for emission. When this was the case, I enclosed the fish in a wire cage, which I immersed in water, examining them every week, until I found they were ready for the experiment.

* I fancy that if the ova come in contact with the air on emission, they are not so readily impregnated as if they are kept covered with the water until the impregnation has taken place, and therefore I wish to lay some stress on the desirableness of thus keeping the air excluded. The milt remains in an active state long after emission, but I have great reason to suppose that this is by no means the case with the roe.

ings of minnows and lampreys (I have never been able closely to examine the spawning of the salmon), convinces me that it is not a correct one ; besides, did any one ever succeed in hatching the ova of fish which had not been allowed to come into contact with milt after exclusion ; if they have, when—where—and how was it accomplished, and where is it recorded ?* I know that I could never succeed, although I have often tried the experiment ; on the other hand, it is the easiest thing imaginable, with due care and a suitable situation, to hatch those that have been properly impregnated after emission. But if I admit, to avoid argument, that this theory is correct, it will not interfere at all with the artificial breeding of trout and salmon ; on the contrary it would materially facilitate it. It would only be necessary to catch a female fish, with the ova ready for emission, and place these ova in clean gravel, in a box, as before described ; but there would be no occasion for males. *T. G., Clitheroe.*

*(To be concluded in our next.)*

## ORCHIDS FOR THE MILLION.—No. XX.

By B. S. Williams, gr. to C. B. Warner, Esq. Hoddesdon.

Climate Cool.—Plants Grown in Pots, with Peat.

*Cyrtochilum maculatum*, from Brazil : blooms from February to March ; it does best grown in a pot, with peat and potsherds ; plenty of water being given in the growing season, but afterwards it should be kept rather dry ; its flowers remain three or four weeks in perfection.

*Cyrtochilum filipes.*—Guatemala, flowers from March to July, and remains in perfection a very long time ; it does best grown in a pot with peat, and good drainage.

*Cyrtochilum hastatum*, comes from Oaxaca. It requires the same treatment as the former species ; it lasts long in bloom.

*Epidendrum verrucosum.*—This fine species is from Mexico. It blooms in June and July, the flowers being of a rich crimson pink, and they remain four or five weeks in perfection. It grows best in a pot, with fibrous peat and good drainage, and it requires a good supply of water while growing.

*Epidendrum vitellinum majus*, from Rosecco, flowers in June and July, and lasts a long time in perfection.

*Epidendrum aurantiacum* comes from Guatemala, and flowers from February to March. The blossoms are of a rich orange colour, with a few delicate streaks of rich crimson in them. This is best grown in a pot with fibrous peat and good drainage, and should have the coolest end of the house, where it can have little heat, with a good supply of water while growing.

*Lycaste Skinneri.*—A beautiful Guatemala plant, which produces its handsome flowers from November to April. The colour of the blossoms is of a pale rosy purple, the centre being deep crimson; it does best grown in a pot filled with fibrous peat, and should be placed in a cool part of the house, where there is plenty of light and but little moisture, except during the growing season. Its flowers remain three or four weeks in perfection.

*Odontoglossum Bictonense*, from Guatemala, flowers in February and March, and lasts a long time in bloom. The sepals and petals are green, spotted with red ; the labellum pink. This will succeed in a pot with fibrous peat and good drainage, and a good supply of water at the roots during the growing season. It should never be kept too dry.

*Odontoglossum cordatum*, comes from Mexico. The sepals and petals of this plant are spotted with brown, on a yellowish-green ground ; the labellum is white, spotted with rich brown. It flowers from January to March.

*Odontoglossum maculatum*, from Mexico, flowers from March to May. This does best in a pot, with peat and good drainage, and a liberal supply of water in the growing season. Afterwards it may be kept rather dry. It lasts long in perfection.

*Odontoglossum pulchellum* is a beautiful Orchid from Guatemala. The flowers are white, with the exception of the crest of the labellum, which is spotted with crimson. They will last four or five weeks in perfection, and are remarkably fragrant. The plant does best in a well drained pot with fibrous peat, and kept in a cool part of the house—rather dry, while in a state of rest.

*Odontoglossum Rossii.*—A beautiful plant from Mexico, flowering in November and January, and remaining long in perfection. It requires the same treatment as the former.

*Odontoglossum Insleayii*, from Oaxaca ; does well in a pot with the same treatment as pulchellum.

*Odontoglossum Egertonianum.*—This fine species is from Guatemala ; the flowers are white and last long in bloom. It does best grown in a pot, with peat and good drainage, and a good supply of water when growing ; afterwards it may be kept rather dry.

*Lælia cinnabarina.*—This beautiful plant comes from Brazil. It flowers in June and July, the colour being a deep red orange, and it remains long in perfection. It does best in a pot, with fibrous peat and potsherds, with a good supply of water in the growing season.

*Lælia flava.*—This fine species is also Brazilian. The flowers are a rich yellow, inclining to orange, and remain long in perfection. Requires the same treatment as the former species.

*Huntleya cochleata.*—Flowers in August and September, and remains long in bloom. It does best in a well-drained pot, with fibrous peat and a good supply of water in the growing season ; afterwards it may be kept rather dry.

*Huntleya violacea* comes from Demerara. It flowers in July and August, and lasts long in beauty. It does well in a pot with peat, and good drainage, placed at the warmest end of the house.

*Oncidium unguiculatum*, from Guatemala. It flowers from October to January ; the lip is a deep yellow colour. This does best in a pot at the coolest end of the house. It keeps flowering for three months in succession.

* There is, however, one fact which would almost lead one to suppose that the ova are impregnated 12 months before emission. It is this,—the male par (salmon fry), are at this season full of milt, and almost ready for emission ; whilst in the females, the ova are so small, that they require a microscope to see them individually, and the whole ovary is merely like a thread ; either the milt of the male is not required to impregnate the roe of the female, or the roe is impregnated long before emission, for the roe of the female par evidently requires many months to bring it to maturity ; but my opinion is, if a female salmon were to ascend a river without being accompanied by, or meeting with a male, that the roe would be impregnated by the *male par*, which always swarms about the salmon spawning beds ; and the experiments of the Duke of Buccleuch's gamekeeper (Shaw), tend to prove that this is the fact—the same excess of males may be desirable that exists in a bee-hive, where there are, at least, a thousand males for one female.

## BRITISH SONG BIRDS.

(Cage Birds, No. 34.)

No. L.—Whilst commenting in a former chapter on the natural instinct of birds, we have asserted that every bird will, in the usual course, sing his own peculiar song *only*. The truth of this, some of our readers venture to doubt. Let me therefore give them *one more* "convincing" proof that what I, Gilbert White, and so very many others affirm, *is* strictly correct.

The redbreast, soon after he has quitted the nest, begins to "record" his song ; and early in August he may be heard singing sweetly. From that time till the present he has gone on improving, till now the gardens round London echo to his voice. And mind—his song is thoroughly perfect ; he "rolls" his anthem with the taste of a first-rate performer, and with all the powerful command of an old bird. If it be urged that he learnt his song from his parent, I say "no." This is impossible, for *the old birds do not sing at all, till late in the winter*. Their offspring, therefore, are self-taught. Nature is never caught tripping in any of *her* movements. It is ourselves who are in fault for not investigating her laws more closely.

We are asked also, whether we think, as most birds of the same species build their nests exactly alike, that the younger are instructed by the older in this matter ? Most assuredly not. Indwelling instinct teaches them this, as well as everything else peculiar to their particular requirements ; and each bird adapts his dwelling as nearly as may be to the constitution and well-being of his family. With respect to caution, however, some particular tribes are, from existing circumstances, far more wary than others (the reason for which, we shall discuss more fully anon), and build in situations as difficult to discover as it would be impossible to penetrate when found. Among the feathered tribe Nature varies her gifts, as indeed occurs amongst ourselves. We are *not* all equally 'cute ; as some of us, 'ere now, like the denizens of the woods, have found to our cost !

Whilst on the subject of nests, I would entreat all such of my readers as have not carefully examined the artistic excellence of their construction, to do so at the first convenient opportunity. It is a piece of exquisitely-cunning workmanship :—

"——— It wins my admiration
To view the structure of that little work,—
A Bird's nest. Mark it well within ; without.
No tool had they that wrought, no knife to cut,
No nail to fix, no bodkin to insert,
No glue to join. Their little beaks were all ;
And yet, how neatly finished ! *What* nice hand,
With every implement and means of art,
And twenty years' apprenticeship to boot,
Could make me such another ? Fondly then
We boast of excellence, *whose noblest skill*
Instinctive genius foils !"

When Hurdis thus sang, I have no doubt he had a nest on the table before him. It is an object to inspire *any* poet with song ; and his reflections on the little architect do honour to his muse.

The further we go with these interesting investigations, the more delighted must we ever feel ; nor can I resist speaking of the gratification I experience in knowing I have so very many readers of a congenial turn of mind. I will now only add, that the instinct of animals, although a subject inexhaustible, and pregnant with the greatest interest, it would not be in accordance with our prescribed limits to pursue further at this time. I have, however, received from all quarters, such unbounded encouragement to "touch" on it as occasion offers, that it will be a leading feature in all my observations hereafter. Before concluding, I take leave to introduce a short but pithy anecdote connected with this matter, on which it seems there *are* "two" opinions. A good friend of mine, a native of Germany "naturalised" here, met me a short time since at the entrance to Madame Tussaud's Exhibition. Regarding me with a knowing look, he remarked,—"My dear fellow, you are on a wrong tack. If you were to write with the pen of an angel (a curiosity, by the way !), who is there in England that would listen to *you* whilst speaking of the wonders of Nature, when they can see *so many murderers* in this Exhibition, modelled in wax with all the startling fidelity of life ? The English are at heart," added he, "essentially a savage people—*and you know it.*"

How anxious am I to redeem my countrymen, and our "ladies fair," from so sweeping a censure ! Albeit my observant and satirical friend had some show of truth on his side, as witness the crowds that throng the Chamber of Horrors, and occupy "first-rate situations" at our public executions. But let that pass,—we hope to "reform it altogether":—

"——*Ingenuas didicisse* fideliter *artes,*
*Emollit mores,*—nec sinit esse feros."

In the company of departing Autumn, we will forge that such things can be ; for

"Her work is a mix'd one, of bounty and plunder,
She strips the green garment that mantles the oak.
Her voice soundeth 'now' with the terror of thunder,—
'Now' sighing, scarce waves Nature's emera'd cloak.
And if at her mandate the falling leaves cluster,
And Earth in her flow'rets no longer is clad,
She gives to the wheatsheaf its ripe golden lustre,
And fills up the Goblet that makes the heart glad."

Who is there amongst us that will not joyously quaff from such a goblet, to the health of so lovely a goddess ?

*William Kidd.*

## Home Correspondence.

*Transplanting Evergreens.*—"When ought I to remove my shrubs ?" "What time of the year is most suitable for planting ? Pray inform me when to commence my new shrubberies ?" are questions repeatedly addressed to those who have to do with garden matters, unmistakeably indicating the fact, that to a large portion of interested persons, the proper period for such operation is not understood. Although in these, as in all other gardening operations, no absolute rule exists ; yet sufficient data are recorded to render tolerably certain the success of the operation based upon them. The ever-changing character of the seasons, the kind of soil, the situation, and other local circumstances, must ever exert powerful influence, and tend to render caution, forethought, and skill, indispensable adjuncts to complete success. In the 4th volume of the "Journal of the Horticultural Society," will be found an able treatise on this subject, by Mr. Glendinning ; and in the *Gardeners' Chronicle* for January 6, 1849, appears an abstract and comment upon it. What I am about to state will serve to confirm the facts there recorded. A year or two ago, it was necessary to remove a large quantity of evergreens, such as make up the ordinary occupants of the shrubbery. And the circumstances attending their removal were such as to extend the period of operations from the last week in August to the following March. The soil was a stiff loam, almost clay, very tenacious when wet, and by no means tractable at any time. The shrubs varied in size from such as a man could easily carry, to those requiring half-a-dozen. The latter size were mostly Portugal Laurels. The first month of planting was dry and sunny. Afterwards rain was frequent. The plants removed in August did not show favourable results. Their foliage assumed in many instances a yellow hue, and a great portion of their leaves dropped off, and the young wood not being sufficiently matured, quailed beneath the influence of the autumn sun. Those transplanted in September, especially the latter part, and October, scarcely indicated their change of situation. Some large Portugal Laurels which were taken from a sheltered situation to one exposed, only cast a few of their older leaves, to indicate their altered circumstances. It will, however, only be just to observe, that at planting time, and once or twice afterwards, a few gallons of water were given them at the roots. This precaution was taken because it was particularly desired they should succeed, and the weather was very dry at the time of their removal ; but I have no doubt that success would have followed without the application. In a limited scale of planting such can be applied, in extensive operations hardly so. It becomes, therefore, a matter for consideration whether it is necessary or not. In looking over the whole of the plants removed, when the growing season commenced, various results were apparent ; but that the months of September and October were the most suitable for transplanting there could not be two opinions. Several removed in March presented sorry spectacles, when summer arrived. They lost all their foliage, and many partially died. Notwithstanding these facts, there can be no period assigned which shall insure success or failure. I have seen Laurels removed in May, with young shoots 6 inches in length, succeed admirably ; and this in so light a soil that no particle of mould adhered to their roots. But the weather was unusually showery ; and I remember an instance of transplanting some large Rhododendrons, when the young shoots were but half matured. The weather was very dry and hot. The watering-pot supplied moisture, and success was complete. On another occasion some Balm of Gilead Firs were transplanted in June, and they succeeded admirably. They were about 3 feet in height. Various similar cases might be cited, were it necessary to do so ; but enough, I imagine, has been stated to show the rule and the exception. *G. L.*

*Cryptomeria japonica.*—It is generally admitted that this fine Conifer will never form an ornamental lawn tree. The sickly, yellow appearance it has for, at least, seven or eight months in the year, is a sad drawback to its general adoption for that purpose. As some situations may, however, suit it better than others, I beg to inquire if any one has succeeded in wintering it, without its putting on the unsightly garb so common to it in most places. I have a tree some 7 or 8 feet high, which this season has borne some seeds (they can hardly be called cones, being globular) ; but last winter, although an exceedingly mild one, it was quite as yellow as on the previous one, which was more severe ; so that I think it is constitutional for the plant to undergo that change, rather than the effect of our climate. The situation in which mine is placed is a dry hill-side sloping to the

south-west, and well sheltered from the north, the subsoil resting on what I believe geologists call the oolite formation. Many of the Conifers succeed remarkably well here, more especially the Deodar, and the Cedar of Lebanon; on the other hand, the Douglas Fir does not thrive at all: the situation seems to be too dry for it, as well as for the Araucaria imbricata, which, though some 15 or 16 feet high, and the tree healthy and well-furnished, is not of so dark a green as some I have seen in a damper place. Nevertheless insignis and some others in the way of Montezumæ, Sabiniana, &c., appear to be quite at home in our dry soil; but the article of Mr. Slow, which was given in your paper a short time ago, confirming my opinion, it is useless repeating it further. As I stated before, I would, however, like to know from some one, who has the Cryptomeria growing under different circumstances to mine, whether they have ever wintered it in anything like a condition worth looking on, as I confess its usual appearance is generally uninviting, until the new growth takes place, which is not before June. *An Old Gardener.*

[The Cryptomeria is in many places even more beautiful in winter than in summer; but the specimens have most remarkable constitutional differences, some being always shabby, others never.]

*The Mocking Bird.*—Your delightful correspondent, Mr. Kidd, has inadvertently confounded the mocking bird, "Sylvia Salicarias," which is a warbler, with the American mocking bird, which is a thrush. With the latter I have no personal acquaintance, and only know it by Wilson's admirable description of it in his American Ornithology; but the former is a common bird here all through the summer; and it sings as perseveringly, day and night, as if it thought it was worth hearing. I think if Mr. Kidd would give this bird a trial, he would find it deserved notice; for, although as a wild bird its song is not very pleasing, yet from its extraordinary imitative powers, I think it would prove valuable if it lived in good society. The habit this bird has of singing all the night through, makes many persons who are not conversant with the songs of birds, and not very attentive to the quality of the song, fancy they have heard a nightingale, but, alas! that sweet songster never graces our country with its delightful notes, probably from the moisture of the climate; and two or three other birds, which appear to be common elsewhere, never show themselves here. Neither the woodlark, the wryneck, nor the nuthatch, are ever met with here; nor even the common bunting, which, 30 miles off, is perched in every hedge, singing its monotonous song as earnestly as if it were delightful music. *T. G., Clitheroe.*

*Blanching Celery.*—This year I adopted the following plan with my Celery, which has answered extremely well. I planted it in a trench and left it to grow to its proper height; I then drew each plant through a circular drain tile, and stopped the top of the tiles with moss, and levelled the ground; in less than three weeks afterwards they were beautifully bleached, quite clean, and came in earlier than in the old way. The drain tiles are very inexpensive, and they do not harbour slugs, &c. *H. M.*

*Early Planted Potatoes.*—The result of our Potato crops is encouraging. We planted, in autumn and early spring, 10 forward varieties; all are very good, with the exception of some few which were allowed to grow after July. We can vouch for the safety of all the earliest kinds, if forwarded by judicious management. Cutting off, or pulling up, the haulm at the end of June or beginning of July, saves the tubers, which by that time should be tolerably ripe. *Hardy and Son, Maldon.*

*The Disease in Cucumbers.*—I presume that too many of your readers are aware that a pestiferous disease has prevailed amongst these useful vegetables for some three or four years; and that, like the Botrytis in the Potato, whole districts have suffered from its ravages; indeed, in some parts it has been a most grievous loss to persons engaged in market gardening. And not only the Cucumber, but others of the same natural order; as for instance, the Melon and the Vegetable Marrow are affected; of this I have had ample experience. I do think that it would be of vast benefit to the gardening community if you would allow an inquiry to be opened in your Paper as to the character and extent of its ravages; for, doubtless, many of those who have suffered by it will be disposed to show forth their experience, and to state fully and freely what remedial or preventive measures they may have adopted, together with their results. It is by means like these—meeting as we can do on common ground, and for mutual benefits—that gardeners can at once glean information, and make deductions of much benefit both to themselves and society at large. A letter which I received this morning so aptly describes the character of the disease, that I cannot do better than use extracts from it; the writer simply seeks advice. I may observe that the case about to be related occurred in Norfolk. He thus commences:—"For four succeeding seasons I have had all my natural (outdoor?) Cucumber plants spoiled with 'the spot.' The plants appear very healthy, grow luxuriantly until the first fruit is about fit to cut, and show fruit in abundance; yet I seldom cut more than a brace or two before they are full of spots, and a kind of gummy substance, which entirely spoils them—the ends of the shoots look as if singed with a hot iron. I have had my frame Cucumbers also spoiled in a similar way. It has made its appearance in my houses this season, very badly at the latter part of the time. I have had it as early as March in my house, but it there acts differently; or, rather, I can treat it differently in that situation. I cannot find any remedy for it out of doors. I have tried different soils and different situations; with manure and without—wet and dry; yet I cannot find a remedy," &c. Thus far my correspondent's experience goes, which exactly coincides with my own; and, I may add, with that of scores within the last five years. Mr. Harley, of High Legh, informed me, some weeks since, that a friend of his at Clapham had told Mr. H., that he knew of some market-gardeners who used to grow Cucumbers out of doors to a vast extent, but who had discontinued their culture, on account of the severe losses they had sustained through this disease. Now, what my Norfolk friend relates as to the severity of the attack on those in houses, frames, and the open ground respectively, precisely confirms what I have experienced; and woe to those which are short of heat, if once attacked. Melons, if short of bottom-heat, quail before its attack in a few days. I have known a pit or frame full of health completely ruined in a week. I was talking last week with Mr. Hamilton, of Stockport, of Pine-growing notoriety, about this disease; when Mr. Hamilton informed me that he has it on his Melons, and he terms it "the spot." He had it some years back in his Cucumbers, and avers, that he should never have kept it under, but for the almost constant use of lime-water applied in a clarified state with the syringe. That heat and atmospheric moisture are antagonistic to the disease I am well assured; for, although I have suffered yearly of late out of doors, and in frames, those in a Pine-house here, although they at times give unequivocal proofs that the disease lurks amongst them—are always successful in spite of it; and an occasional plucking, with abundance of atmospheric moisture, have ever kept it fairly at bay. Now, it is a complete puzzle to me how the spores of this fungus, for I must for the present assume it to be one, exist through the winter. If germs for the succeeding spring are preserved on other living vegetables, weeds, &c., how is it that its devastating powers are not manifest there? Is it possible that it can exist on inorganic bodies, or on dead vegetables; or is an instance known of parasitic fungi thriving equally on the living and the dead? All these things should be thoroughly examined into, in order to know the precise ground our enemy occupies; for it is only by ascertaining the exact habitude of such pests that we can hope to exterminate them in the end. It seems strange, that from the commencement of the Potato disease, there has been greater complaints of the devastations of parasitic fungi than heretofore; at least such is my opinion; and I am assured that I am no way singular in holding it. The country folks here aver that there has been no luck with the Potato since that singular visitation of swarms of flies, which occurred some dozen or 14 years ago, when people could scarcely open their mouths in some parts without drawing in a shoal of these minute creatures. And, indeed, it does appear at first sight to have formed a kind of era in these matters; for since then the troubles of the farmer and gardener seem to have multiplied exceedingly. *Robert Errington, Oulton Park, Sept.* 29. — My Cucumbers are all attacked in the manner exhibited by the enclosed specimens. The complaint is very prevalent in this neighbourhood, both in frames and in the open air, but the latter are certainly the worst. Melons are also affected in the same way. I find that the garden here has been infected by this complaint for these last four years. The Cucumbers I have sent for inspection were cut from plants growing in a house which is heated with hot water pipes for top, and a tank for bottom heat. The attack generally commences with the setting of the first fruit. The plants that I now have looked well up to that stage of growth. Three or four plants in the same house that have not yet commenced bearing, or only just beginning, are looking extremely strong and vigorous; but there are already indications that they will go off in the same manner. Both dry and moist temperatures have been tried, with a view to remedy the evil, but with the same results; no effect for the better has been produced. I may mention, that the water used for watering has always been applied in a tepid state. *C. E.*

*Hedera Rœgneriana.*—The assertion made at p. 597 is solely grounded upon a private communication by Professor Hartwiss, of the Imperial Botanic Gardens, in Nikita, Crimea, which I had an opportunity of perusing. There is no description to be found in works within my reach of Aquilegia, Juniperus, and Pæonia Wittmanniana, except the mere mention of the names in nursery lists. I believe, however, such may be discovered in "Bullet. Acad. St. Petersburgh," of which I notice an extract—descriptive of Pines—in Loudon's "Magazine of Gardening," vol. viii., p. 112. In the same periodical, at page 224 of vol. v., is a notice of some Caucasian plants by Mr. Booth, of Hamburgh, including a Hedera—H. taurica. *J. U. H., Edinburgh.*

[Pæonia Wittmanniana was figured in the "Botanical Register" several years ago.]

*Bedding out Calceolarias.*—As some of your readers may not be aware that these plants are best propagated at this season, I take the liberty of saying that, for several years I have never put in my general stock of this interesting group before the middle or end of this month, and often later—sometimes even as late as January, and then, as well as now, they were struck without heat of any kind. So exceedingly accommodating is this tribe of plants in this respect, that any cottager may strike them with facility. The only requisites are to keep them out of the sun and tolerably damp. It is very rarely that any rot off by what is called damp. The power of resisting this enemy is wonderful; while on the other hand, a dry comfortable heat, which at this untoward season is congenial to most other things, is fatal to Calceolaria cuttings. The mode which I adopt is, to put a large number, say 50 or 60 of the small-leaved kinds, into an 8-inch pot, well drained, and filled with the usual sandy soil. I then place them in a cold frame, behind a wall or building, facing the north; and an occasional watering is all they require, until the appearance of severe weather makes it advisable to remove them to some more secure place. Not more than one in a hundred fail to grow. Their progress certainly is not fast, but it is not wanted to be so, as by February every pot is full of roots; and if they had been struck sooner they would only have so much the longer to stand in a stunted condition, which too often engenders disease or insects, while it rarely happens that they can be accommodated with separate pots before that period. As there is nothing more ornamental than Calceolarias, I strongly advise the amateur or cottager, who has a single plant or two in his garden, to try his hand at increasing it. I imagine that he will be agreeably surprised to find how easily the operation is accomplished. *An Old Gardener.*

*The Maiden Hair Tree.*—There are larger specimens of the Salisburia adiantifolia in the pleasure grounds of the Earl of Darnley, at Cobham-hall, Kent, than any yet mentioned in your columns. The largest tree measures 47 feet in height, and the bole, 6 feet from the ground, is 4 feet in circumference. *G. Wilkerson, gr.*

——The inquiry after the size of examples of the Maiden Hair Tree, at p. 614, has raised in me a curiosity to know what is the present state of the following specimens, mentioned by Loudon in his "Arboretum et Fruticetum, Britannicum," Vol. IV., p. 2099:—At Purser's-cross, near London, one tree, in 1837, was 60 feet, another 50 feet high; in Mile-end Nursery, 60 feet high, and at Leigh-park, Somerset, 40. The tree in the Mile-end Nursery was figured by Loudon in the work just mentioned, Vol. VIII., p. 360. *Diss.* [We believe the last-mentioned specimen no longer exists, the ground being covered with buildings. We remember it a beautiful tree 34 years since.]

*Fuchsia Riccartoni.*—I have now a plant of this sort 14 feet high, covered with innumerable blossoms from the top to the ground. It has never been matted, or had any covering during the last four winters. *J. Gould, Amberd.*

*Musa Cavendishii.*—Will any of your correspondents kindly tell me how long the fruit of this Banana is in ripening. A fine plant of it just 12 months old threw up its flower-spike in May last, and has formed a very large bunch of fruit, which, after swelling to a fair size, has now remained three months without exhibiting any symptoms of maturity. I am told by those familiar with the Banana in tropical climates, that I ought to cut the bunch before it is ripe, and hang it up in a dry place till the fruit turns yellow. My plant is growing in an Orchid-house and has had plenty of heat, and water has been withheld from its roots now for a long time. I want to destroy the fruiting plant, as a sucker is now making very rapid growth, and has attained a large size. *J. R.*

*Wintering Eating, as well as Seed Potatoes, in Charred Peat.*—Last autumn I mixed about a peck of Potatoes with charred peat; the Potatoes had not sprouted above half-an-inch by the 1st of March. For those who have many acres to plant and cannot spare room to spread them out thinly, this plan would be of great service, and it could be pursued out of doors by merely taking the precaution to lay down a good layer of peat first; this would prevent moisture from rising amongst the Potatoes. The heap might be covered over with peat and finished with some slight covering, which would keep rain or frost off. The charred peat prevents heating and sweating, which are two great winter enemies to seed Potatoes. I have all my eating Potatoes stored in this way in a shed. The peat makes them as black as toads, and a little grumbling may be heard just before cooking time from the maid of all work, who gives the poor Irish peat everything but its right name; but with this trifling drawback it is certainly an excellent material for storing all kinds of roots in. *James Cuthill, Camberwell.*

*Use of Salep in Diarrhœa.*—℞. Decocti radicis Salep ex rad. Salep ℥ss prepar., ℥ij; syrupis altheæ, ℥j. A tablespoonful every hour. The above cured me (and is renowned in Syria for so doing) of a dangerous diarrhœa on the Continent. But I had no idea that Salep was a root indigenous to Great Britain! till this day, on opening the 16th vol. (1773) of "Doddsley's Annual Register," where, amongst "useful projects," page 128, I find the culture and use of the Orchis roots (or Salep) strongly advocated. I pray you examine for humanity the Salep as food, instead of sago and arrow-root, as well as for medicine in diarrhœa. You see it is useful in stone and gravel, and in that state of consumption where blood turns watery. *J. E.*

*Carrots and Onions.*—The unsuccessful attempts to grow autumn-sown Carrots to perfection, complained of by your correspondent "An Old Gardener," is no more than a corroboration of my statement, that in most places, if sown in the open ground in autumn, they are found to be an uncertain crop. Having assisted in sowing and managing 300 lights of them for years, I can with confidence assure your correspondent, that if he follows my plan, he will find the result all that he can desire; it is the only way in which I ever saw the market gardeners grow them for an early supply, and I always found them come to the greatest perfection. They will succeed if sown now, but certainly the sooner the better.

As respects sowing on a hotbed I can say but little, never having seen that plan practised; but in my opinion, it is dung and labour thrown away. When a succession has been required, I have made up a bed about the middle of January (in the same way as before), and sown it with horn Carrots and short-top Radishes; thinning the Radishes to about 2 inches, and the Carrots to 1 inch apart, managing them in the same way as the others till the latter end of February, between which, and the time the Radishes were fit for use, they had two or three good waterings; the lights were continued on at night till the Radishes were all off; the Carrots were then thinned to 3 inches apart, and the frame taken away. For a crop to succeed them, some may be sown on a warm border about the same time, sowing Radishes with the Carrots, and covering at night with stable litter. Your correspondent is quite right as regards Onions. The best sort for the purpose I ever found is the White Lisbon; if planted out in March it will grow to a large size, but it is not a good keeper. It is extensively grown by market gardeners. If large bulbs are desired, the best way to grow them is to sow a small bed (of either the Reading or New White Globe), very thickly about the middle of May, on a warm border. They will form bulbs about as large as Peas; they will be ripe about the same time as those sown in March; dry in the same way; then spread them thinly on the floor of a dry room till February, when shallow drills should be drawn across a rich piece of land, 6 inches apart. Plant the smallest bulbs 4 inches apart in rows, and just cover them with earth. Keep them free from weeds, and they will grow very large, and if dried they will keep for some time, though they cannot be depended on so surely as those sown in March. A bed should be sown in every kitchen garden, either as above, or else in August; as, by having a supply of them, the gardener is enabled to thin his spring sown ones out to the required distance at once, by which means they arrive at greater perfection. *J. Steel, Clitheroe.*——I have been in the habit of occasionally sowing Carrots in autumn for these last 15 years, in the various situations in which I have been located; but I have never in any case found them to answer my expectations, or to enable me to dispense with forced Carrots in spring. They were always of a sticky character, and white in colour, running to seed soon. From frequently seeing them recommended to be sown in autumn, I had concluded that our northern climate was too severe for them to stand the winter and arrive at perfection. In the case of Onions, I find the Tripoli to be one of the most useful sorts we have; large Onions at an early period being in request here. I sow it mixed with Strasburgh about the 12th of August, on an early border, in soil deeply dry or trenched, and well manured. The result gives me every satisfaction; but if the Tripoli is not used soon after being pulled, it does not keep equal to the Strasburgh. *R., Aberdeenshire, N. B.*

*Expeditious Grape Growing.*—Seeing, by the report of the last meeting of the Horticultural Society, that my brother has succeeded in fruiting and ripening wood and fruit of the Black Hamburgh Grape from eyes struck in February last, I beg to state that I have got good bunches and well-swelled berries of Muscat of Alexandria, on Vines struck from eyes in March last. The Vines were not stopped at 15 inches high, as his were, but at 8 feet, consequently the fruit is produced on the laterals. I would particularly recommend those about planting Vineries, if they have the convenience, to strike their own plants in February or March, and plant them out in May or June. Some which I have treated in this way here in our new Vineries, surpass two-year-old plants planted in April. *R. Elphinstone, Flixton Hall, Harleston, 16th Oct.*

*Borden's Meat Bisuit.*—At page 629, a correspondent mentions that "four ounces of biscuit make from a pint to a quart of excellent soup." Would you have the goodness to correct the passage, saying—one ounce of the biscuit makes a pint of most nutritious soup. *Wm. Bollaert, St. Peter's Alley, Cornhill.*

*The Fox Moth.*—In your "Notices to Correspondents" it is stated that the larvæ of this moth (Lasiocampa rubi) are difficult to rear, especially so late in the season. I beg to say that this is the best time of year for collecting them, as they are now at their full growth, and the perfect insects may be reared without the least difficulty—all that is required is to have a box with a wire gauze cover, and to place in this box a turf of heath, put the larvæ in it, and let it remain exposed to the weather through the winter; in the spring they will come out for a few days and then spin their cocoons, and the moths will appear early in June. *Henry Doubleday, Epping, Oct. 14.*

*Horticultural Exhibition at Paris.*—I went to the show of the Société Nationale d'Horticulture de la Seine, on Saturday, the 27th of September. It was held in a very large tent, pitched over one of the fountains in the Champs Elysées. I observed several (what I thought) improvements in the way of conducting this fête. It lasted four days; my visit was on the second day, when certainly everything was perfectly fresh, and by the crowds I saw entering on the third day, it appeared not to have lost any of its attractions. Not only were fruit and flowers exhibited, but also vegetables, artificial flowers and fruits, ornamental flower-pots, gardening instruments, miniature drawing-room and boudoir fountains, for keeping bouquets fresh, and even some singing birds and gold fish. The show of green and hothouse plants was very inferior to ours, but there was great beauty and variety among the common flowers, such as Asters, Dahlias, &c. Among yellow Picotees, we have nothing equal to show in England. The grounds of several were brighter and deeper coloured than ours, with much more variety in the colour and marking of the edgings. Indeed, if a little more regularity of shape could be obtained, some of them would be very striking flowers. Why cannot we have in England, as they have now (Oct. 2) at Paris, abundance of Strawberries and Artichokes in all the markets? What struck me most was the great profusion of fine ripe Pears exhibited. While we can only obtain two or three good kinds at this season, there are at least eight or ten at Paris. *L. H., Ipswich.*

## Societies.

Entomological, *October 6.*—J. O. Westwood, Esq., F.L.S., President, in the chair. An extensive list of donations to the library from the Royal Societies of London and Madrid, the Royal Agricultural Society, the Entomological Society of Stettin, the Natural History Society of Geneva, the Literary Society of Liverpool, and various other donors, as well as a number of rare British moths, from Cambridgeshire, presented by Mr. Barlow, was announced, and thanks ordered to be returned for the same. John Curtis, Esq., F.L.S., and Captain Lodder, were elected members of the Society. The President announced that copies of the bye-laws, as amended at a special general meeting, recently held for that purpose, were ready for distribution. Mr. Samuel Stevens exhibited fine specimens of Heliophobus hispidus, and other rare moths, from the Isle of Portland, also Deiopeia pulchella, from Somersetshire; Mr. Edwin Shepherd, a new species of Peronea, reared from Spiræa ulmaria; Mr. F. Smith, an assemblage of the cocoons of Ilythia sociella; Mr. Shepherd, a remarkable cocoon of Saturnia Carpini, and various rare moths from the New Forest and Fulham; Mr. Thompson, a case of insects from Morocco; and the President, several larvæ of the Fox Moth (Lasiocampa Rubi), found on the Wild Rose, near Swansea. Mr. Young presented a quantity of Coleoptera, from Renfrewshire, including the rare Tetratoma ancora. Mr. Stainton read a notice of the distinctions of three nearly allied species of Lithocolletes, one of which was new to the British lists. Mr. Adam White gave an account of various early collectors of, and authors upon, spiders in this country, including Lister, Albin and Martyn, whose works had been recorded by Walckenaer, and also Dandridge, overlooked by the French arachnologist, but whose manuscripts, containing descriptions of 500 species of Arachnida (including Acari, &c.), found near London, were preserved in the British Museum, and from which it appeared that Albin had copied many of his descriptions without acknowledgment. Baron Walckenaer had complained that Latreille had in the same manner adopted his sections of spiders as well as those of Kirby of bees, and had merely given them generic names; a remark which called forth much discussion in justification of the writings of Latreille. A further memoir, by Mr. Newman, of Stroud, on the Bombinatrices was read, in which the writer reasserted that the male Bombi never re-enter the nest after they have once quitted it, and that they have regular rounds for flight; both which statements were combatted by Mr. F. Smith, who had received observations confirmatory of his statements from Mr. Wallcot, of Bristol. Mr. Stainton communicated a translation of a remarkable memoir by Dr. Von Siebold, in which that author suggested the probability that some of the Psychidæ underwent an alternation of generations, the alternate brood producing only female wingless individuals, whilst the other gave birth to ordinary males and females.

## Notices of Books.

*The Popular Nomenclature of the American Flora.* By Berthold Seeman. (*Die Volksnamen, &c.*) A pamphlet, 8vo, pp. 54. Hanover: Part 1.

This little work, seems by anticipation, to show how important to everybody will be M. Alphonse De Candolle's Dictionary of the vernacular names of plants, whenever it appears.

We cannot do better than let Mr. Seeman explain his views in his own words:—

"Whoever has paid attention to botany will have observed that in every country—whatever may be the degree of civilisation it has attained—the people have made some advance in discovering the manifold uses to which plants may be applied, the medicinal and economic virtues they possess, or the noxious qualities, odour, beauty of form, and other prominent peculiarities by which they are distinguished. Wherever this is the case, wherever plants have attracted popular attention, it has given birth to vernacular names. Such names are familiar to thousands, and, while the scientific appellations undergo continued changes, the former descend almost unaltered from generation to generation, and become only extinct when the race that once pronounced them has itself disappeared.

"In an age like the present when it is one of the great aims to render science popular, names of such a nature ought to receive due consideration. But it has been far from being so. Many botanists think them of not sufficient importance to be enrolled in the books of science, and though others set a higher value on them yet no attempt has ever been made to collect all, and to regulate the heterogeneous mass. A well arranged Synopsis of the vernacular with the corresponding scientific names would prove highly useful. It would enable the naturalist to make himself at once acquainted with the most valuable productions of a country, and greatly facilitate his investigations. The medical man, the chemist, the traveller, in fine anyone coming in contact with the vegetable kingdom, would be equally benefited. By simply asking the native name, they would instantly have the scientific appellation, the key to farther inquiries. Occasional mistakes may indeed occur. But these are the exception, not the rule. The vernacular nomenclature is less fallible than it is generally supposed. Tell a Brazilian to show you the Parahiba of his country and he will point to Simaruba versicolor; inform a Chilenian that you are anxious to see the Pichinilla, and he will take you to Fabiana viscosa; or ask an Esquimaux to bring the root of the Ma-shu, and he will fetch that of Polygonum viviparum.

"These considerations led to the compilation of the Popular Nomenclature of the American Flora, and I would have completed the task had not other labours detained me, and had not afterwards the conviction been forced upon me that it would be advisable, instead of confining myself to America, to extend the plan, and enumerate the popular names of the plants of the whole world. Though experience has taught me that in an undertaking of this nature perfection can only be reached in the course of centuries and by the combined efforts of many, still I am convinced a certain degree of completeness is attainable. At present, however, I am unable to execute this plan; want of time and materials prevent me.

"The nomenclature has been divided into two parts like a dictionary, one containing the vernacular-scientific, the other the scientific-vernacular names. The names are arranged in alphabetical order, and spelt either according to the prevailing language of the country in which they are current or that to which they belong. They are given as popular currency has rendered them, and are neither corrected because they are not in accordance with their derivation, nor altered on account of their erroneous grammatical construction. They are never translated from one language into the other, nor have any translated names—the useless encumbrance of scientific works—been received. One and the same name being often applied to several plants in different countries, each name is followed by that of the state in which it has currency, and succeeded by the name of the person on whose authority it is given. By following this mode of quotation I have succeeded in solving the puzzle which hitherto seems to have deferred many an author from attempting the task I have undertaken."

We have only to add that the author has performed this part of his task well, and as fully as could be expected from a first attempt. The volume, when finished, will be of real value.

## Garden Memoranda.

Messrs. Rollisson's Nursery, Tooting. — Few nurseries contain a more extensive collection of plants than this does. It possesses a fine range of houses, three of which have been built expressly for Orchids. The first is span-roofed, and of considerable length, with a table up the centre, and one on either side. There are some hundreds of plants in this house, some of them being fine specimens; and there are several in bloom. Miltonia Clowesii is beautifully in flower. There are three varieties of this plant here; one of them, a fine kind, was imported a good while ago, but is only now flowering for the first time. Along with it was Miltonia spectabilis, the same plant which was at the Chiswick flower show on the 19th of July, and yet it has, at the present time, more than a hundred blooms on it. It is a very fine plant of the kind. In the same house was a variety of M. spectabilis, with purple flowers. It grows in the same way as spectabilis, and the blossoms are very large, often measuring 3 or 4 inches across, and of a fine rich colour. Associated with these were Huntleya Wailesiana, with white and purple flowers; Galeandra Baueri, a fine specimen of Sobralia macrantha, Peristeria elata—the Dove-plant, P. guttata, Brassia Lanceana, some Oncids, Cymbidium giganteum, and Lycaste Skinneri. At the end of this house was a fine collection of Pitcher-plants, all in excellent condition. The pots were plunged in sphagnum in gentle bottom heat. Among them were Nepenthes ampullacea, N. Rafflesiana, N. Hookeriana, and other fine sorts. After leaving this house, a few steps farther on led to another, which was filled chiefly with Cattleyas, Lælias, and Odontoglossuns, &c.; Lælia superbiens was making luxuriant growth. This is rather a difficult plant to manage; but all the extra care that it requires is amply compensated for by its charming spikes of purple blossoms. The magnificent plant of this Lælia, at Chiswick, when in bloom, is worth travelling miles to see. Odontoglossum grande, Cattleya violacea, C. Loddigesii, the beautiful Dendrobium chrysanthum, were all in flower here, together with several others. Contiguous to this is another span-roofed Orchid house of considerable length, containing on a raised platform at the end some fine specimens of Pitcher-plants, among them were Nepenthes albo-marginata, N. Rafflesiana, &c.; and on the left of these was a nice collection of variegated Orchids under bell glasses, while on the right was a tank for aquatics. The Orchids in this house were principally East Indian kinds. We remarked a fine stock of Vanda tricolor and suavis, which has lately been received from Java. There was also the beautiful Phalænopsis grandiflora, the queen of all the Orchids. Several plants of Burlingtonia venusta were flowering beautifully here; some of them having as many as nine spikes of flowers open on them at one time. This is a very useful Orchid, and ought to be in every collection.

Along with these were the tailed Angrec (Angræcum caudatum), a fine plant of Aerides quinquevulnera, with five spikes of flowers; Saccolabium guttatum, and many others. A span-roofed Heath-house was well filled with plants of that interesting genus. Heaths are cultivated with great skill here; a fact sufficiently attested by the many prizes they have obtained at great metropolitan flower shows, during the season. The next thing that attracted particular attention was a fine stock of the beautiful Rhododendron javanicum, of which there are here some hundreds of plants of different sizes, from 6 inches to 2 feet high. The Camellias in the Camellia-house are well covered with flower-buds, and a fine bloom may be expected.

## FLORICULTURE.

THE HOLLYHOCK.—Few autumn flowers are more valuable, for the general purposes of decoration, than the Hollyhock; and I am glad to see that, within the last year or two, the tide of fashion has decidedly set in in its favour. This fine flower has been long neglected, and has had much to complain of; but now its merits are beginning to be fully recognised. It well deserves all the attention that it is likely to receive; for, except the Dahlia, where shall we find its equal in point of beauty at the season in which it blooms. It is hardier than the Dahlia, and will produce a goodly display for a considerable time after the beauty of "Autumn's king" has been cut off by frost. It also looks well in situations in which the Dahlia would be less suitable, as, for instance, against walls; and I have seen the lofty front of an old-fashioned conservatory rendered exceedingly gay by placing a Hollyhock against the clumsy wooden divisions of the sashes. Like most other things, since more attention has been paid to this flower, it has greatly improved in shape, and some of the finest varieties raised of late years may be said to be tolerably perfect in this respect. There is, however, yet ample room left for amendment, and as some of the less initiated in the science of floriculture may be anxious to know what constitutes a good Hollyhock, I venture to furnish them with the following information on the point taken from Mr. Paul's excellent treatise* on the history, properties, and culture of this flower—a shilling's-worth which every lover of Hollyhocks should possess.

"'1. The diameter of the centre should not be less than 3 inches, and the outline not less than half a globe: the florets of which it is composed should be thick, dense, whole on the edges, and entirely free from fringe or serrature.

"'2. The principal or guard-petals should not extend more than from a quarter to half an inch beyond the outline of the centre: they should be thick and flat, forming a circle, and entirely free from notch or serrature.

"'3. Size is a distinct property: when equal in other respects, the larger the better.'

"The above 'characteristics' are supplied by Mr. Downie, and to this definition he appends the following list, which he considers 12 of the best Scotch flowers:

1. Captain Peat (Downie and Laird's), light purplish rose.
2. General Bem (R. Veitch's), vivid scarlet.
3. Illuminator (Downie and Laird's), deep crimson.
4. Lord Willoughby d'Eresby (Downie and Laird's), bright ruby red.
5. Mesmeriser (Downie and Laird's), nearly black.
6. Nova Scotia (Gemmell's), dark maroon.
7. Napoleon (Pow's), shaded lilac.
8. Professor Syme, or Jamie Duff (Downie and Laird's), deep rosy purple.
9. Spectabilis (Downie and Laird's), fine rosy peach.
10. Sir David Wedderburn (Currie's), dark chocolate.
11. Susanna (A. Veitch's), shaded white.
12. William (A. Veitch's), purplish maroon.

"On the same subject Mr. Chater, of Walden, thus writes: 'The definition of a good flower, in my humble opinion, is as follows:

"'1. It is indispensably necessary that the petals be of thick substance, the edges perfectly smooth and even.

"'2. The florets occupying the centre must be compact, closely arranged, rising in the middle so as to make a half globular form, with a stiff guard-leaf extending about half an inch, or rather more, from the centre florets.

"'3. The arrangement of the flowers on the stem or spike ought not to be too thick or too thin. I consider most of the following six varieties perfect flowers; and as regards their general habits, excelled by none that I have ever seen: Walden Gem, Enchantress, and Pulchella (Chater's); Model of Perfection, Queen, and Rosea grandiflora (Baron's).'

"The following is Mr. Chater's list of the next best that he has seen, arranged according to colour:

Obscura (Chater's), mottled.
Attraction (Baron's), mottled.
Mr. C. Baron (Chater's), salmon and pinkish salmon.
Aurantia (Rivers'), salmon and pinkish salmon.
Comet (Chater's), red.
Fireball (Bircham's), red.
Coccinea (Baron's), red.
Magnum Bonum (Baron's), dark.
Purpurea elegans, new (Chater's), purple.
Rosea alba, new (Chater's), mixed colours.
Bicolor (Chater's), mixed colours.
Sulphurea perfecta (Rivers'), yellow.
White Perfection (Chater's), white.

"The next definition is from Mr. Parsons, of Ponder's-end, one of the oldest and most successful amateur cultivators of this flower.

"1st. Shape: this should be something less than half a ball. The flowers should be free from pockets, the anthers not seen. The petals should be free from indentation or notch.

"2d. Size: The ball should be from 1¼ to 2½ inches high, according to its diameter; the greater the diameter the greater should be the height. The diameter of the ball should never be less than 2½ inches. The guard-petals should extend from ⅛th to ¼th of an inch beyond the ball; the larger the ball the broader should be the guard-petal. What we aim at is proportion. The different parts of the flower should bear such relation to each other that the whole may be uniform, and in nothing offend.

"3d. Substance: the petals should be thick and smooth.

"4th. Spike: this should never exceed 7 feet. The longer the footstalks, in moderation, the better, as the bulk of the spike is in proportion to their length, and the greater the bulk the finer the object.

"The following are 12 of the best flowers I have seen:—

Comet.
Enchantress.
Magnum Bonum.
Mr. C. Baron.
Obscura.
Queen (Baron's).
Rosea alba, new.
Rosea grandiflora.
Rosy Queen.
Sulphurea perfecta.
Walden Gem.
Watford Surprise.

"In analysing and comparing the foregoing definitions, we find those of Mr. Chater and Mr. Parsons so nearly agreeing as scarcely to require comment. Mr. Downie, however, although agreeing in regard to substance, &c., differs in the essential points of size and form. This is the distinction: the Scotch florists attach more importance to size; they contend also for a higher ball and a narrower guard-petal. After constructing various models, examining numerous flowers, and duly weighing these points, we venture to give the following proportions: height of ball, 1⅛ inch; diameter of ball, 2½ inches; extension of guard-petal beyond ball, ⅜ inch. This is given as the smallest dimensions admissible. We would not fix a limit to the increase; but whatever it may be, it should hold the same proportions."

Mr. Paul gives a sketch in outline illustrative of his idea of a good Hollyhock, but in this particular his opinion and mine is somewhat at variance; and I hope to be able to point out soon what shape I consider a good Hollyhock should possess. In addition to the points already named, Mr. Paul says—"I would state that the colour, whatever it may be, should be clear and decided. In striped, veined, mottled, or shaded flowers, the ground and overlaying colour should be distinct and well-defined, free from all confusion. The guard-petals should be of great substance, neither ridgy, serrated, nor curled. I should like, also, to see the flowers of increased substance, free from pockets, and of dwarfer habit. We look for great improvement in this latter point. Viewing the plant merely as an object of garden decoration, the height to which it grows is perhaps no disadvantage, but often a recommendation. When rising behind dwarfer plants, it indeed presents a noble appearance, and may justly be styled the monarch of the garden. But as a florist's flower, we hold this to be an objection, and to the correction of this point the attention should be directed. It is probable that important results would arise from hybridising with the dwarfer species, or saving seed from the dwarfest varieties."

I quite agree with Mr. Paul that, by means of judicious hybridisation, the general appearance of this flower may be considerably altered for the better; and I hope with him that this point will receive that attention which it demands. *J. E.*

EAST FORFARSHIRE HORTICULTURAL SOCIETY, *Sept.* 17.—An excellent display of florist and other flowers was produced on this occasion; but we have only been furnished with a list of the awards, without the names of the subjects for which they were given.

NATIONAL FLORICULTURAL, *Oct.* 9.—Mr. STAINS in the chair. Hollyhocks were furnished by Mr. Clarke; Dahlias by Messrs. Bragg, Pope, Rawlings, and Drummond. Three nice Fuchsias came from Mr. Dobson, of Woodlands Nursery, Isleworth, and some good Petunias from Mr. Gadd. A first-class Certificate was awarded to Mr. Drummond, of Bath, for a very beautiful Statice, apparently a cross between S. imbricata and S. macrophylla. The same raiser also received a certificate for a bright scarlet Dahlia called Bob Drummond. It was well shaped; but in the flowers exhibited, the centre appeared to be scarcely sufficiently elevated. Two new members were added to the liste, and two more were proposed for election at the next meeting.

SYDENHAM FLORICULTURAL, *Sept.* 10.—The 1st prize for the best 12 Dahlias was awarded to Mr. R. Chawner, gr. to G. A. Perian, Esq., for Mrs. and Mr. Seldon, Champion, Sylph, Duke of Wellington, Model, El Dorado, Sir F. Bathurst, John Edwards, Queen of Lilacs, Princess Louisa, and Sir Charles Napier; 2d, to Mr. G. Stokes, gr. to W. D. Harling, Esq., for Fearless, Beeswing, Optimus, Toison d'Or, El Dorado, Sir F. Bathurst, Duke of Wellington, Mr. Seldon, Standard of Perfection, Nonpariel, Purple and Yellow Standards; 3d, to Mr. R. Thompson, Florist, Blackheath. Best 6: 1st, Mr. Jauncey, with Mrs. Seldon, Crocus, Richard Cobden, Queen of Lilacs, Captain Warner, and Fearless; 2d, Mr. Gundry. Best 6 Fancies: 1st, Mr. Chawner, with Miss Wayland, Jenny Lind, Lady Granville, Elizabeth, Lady Cullum, and Forget-Me-Not; 2d, Mr. Mockett, with Gasparine, Madame Wachy, Flying Dutchman, La Rosa, Lady Granville, and Dulcis. Fuchsias: 1st, Mr. Mockett, with Psyche, Kossuth, Pearl of England, Don Giovanni, Dr. Grosse, and Sir F. Falstaff; 2d, Mr. Reid, gr. to James Hunt, Esq., with Kossuth, La Carnation, Duchess of Kent, Bianca, Triumph, and Triumphant. Scarlet Geraniums: 1st, Mr. Stokes, with Tom Thumb, Beckenham, Compactum, and Shrubland; 2d, Mr. Pullen, with Mrs. Mayler, Duke of York, Princess Alice, and Tom Thumb. Several other prizes were awarded for Stove and Greenhouse plants, Fruit, &c., and altogether it was an interesting show; but we are sorry to add that it was badly attended.

WYCOMBE, *Sept.* 18.—The friends of this Society will be glad to learn that its funds are in a prosperous state—that several new members were added at this meeting, and that altogether the day passed off the best on record. Dahlias, in collections of 24, were exhibited by, 1, Mr. Bragg; 2, Mr. Ford; 3, Mr. Walker. 12 Fancies: 1, Mr. Bragg; 2, Mr. Ford; 3, A. Lane, Esq. Private growers only: 1, Mr. Shrimpton; 2, Mr. White; 3, A. Lane, Esq; 4, Mr. Bond. Greenhouse plants, Fuchsias, Verbenas, Hollyhocks, Cut Flowers, Marygolds, Zinnias, Roses, Fruits and Vegetables were all produced by, and prizes awarded to, Mr. Sangston, Mr. Bond, A. Lane, Esq., Mr. S. Treacher, Mr. White, Mr. Walker, J. Nash, Esq., Mr. Green, Rev. G. Broadhead, Mr. Wood, F. J. Reynolds, Esq., N. Blandy, Esq., Mr. Harman, T. Edmonds, Esq., Joseph Hunt, Esq., &c. For valuable novelties, we freely grant the glories of the day to Mr. Hunt to whom was awarded an extra prize for a collection of Seedling Sweet Williams, flowers entirely his own, and comprising the greatest possible variety and beauty. The Rose, the Tulip, the Pansy, are each cherished with fondness; but to these, and to other florist flowers, we are glad to be able to add a new claimant, viz., the Sweet William; long may it prosper under the watchful and vigilant eye of "my Lord of Cressex."

YORK HORTICULTURAL, *Sept.* 24.—Among plants, there was nothing particularly striking, except some well grown specimens of Fuchsias. Messrs. Backhouse obtained the 1st prize, for the best six dissimilar varieties, with Fair Rosamond, Comte de Beaulieu, Elizabeth, Sir John Falstaff, Don Giovanni, and Scarletina Reflexa; 2d, Mr. Edward, with Kossuth (very fine), Elegance, Sir J. Falstaff, Inaccessible (extra), Dr. Smith, and Prince Arthur; 3d, Mr. Edward, with Purity, Esteem, Kossuth, Prince Arthur, Globosa Grandiflora, and Smith's Alpha. For the best three Fuchsias: 1st, J. Roper, Esq., with Minerva Superba, Kossuth, and another; 2d, Mrs. Stapylton, with Napoleon, Corallina, and Elegans. And for the best Single Fuchsia: 1st, Mrs. Stapylton, with Pearl of England; 2d, Mrs. Stapylton, with Dr. Smith; 3d, J. Roper, Esq., with Mayle's Purity (fine). There was a tray of six Seedling Petunias, with no name attached, one of which was a very beautiful variety, of good substance and outline, and striking in colour. Of Dahlias, there was a very superior show, and many of the blooms were in excellent character. It is to be regretted that the northern and southern growers of the Dahlia cannot be brought to compete together; this would create more spirited competition, and, we doubt not, tend to improvement in the culture of this "King of Autumn," by stimulating both nurseryman and amateur to excel his competitors in their productions. Why not establish one grand Dahlia exhibition, itinerant in its character, holding its meetings at York, Derby, Manchester, Birmingham, or at such other places as might be agreed upon as the most convenient for the northern and southern florists to meet and compete together? The principle has been acted upon by the Tulip growers, and found to work well, and why not with the Dahlia? This, we submit, is worthy of consideration, and we shall be glad to see the matter taken up by some of the principal of our southern and northern florists. Mr. G. Edward, of York, exhibited some fine flowers in his stand of twenty-four dissimilar blooms, which comprised the following varieties: Queen of Lilacs, Crocus, Princess Louisa, Nil Desperandum, Mrs. Bacon, Earl of Clarendon, Champion, Elizabeth, Hero, Mrs. Hansard, Duke of Wellington (extra), El Dorado, Venus, Lord Mayor, Silver Florin, Shylock, Queen of Dahlias, Kelson's (a promising flower), George Glenny, Imbricata, Admiral, Keynes' Magnificent, John Edward, Mr. Seldon, and Black Diamond. J. Pease, Esq., Darlington, came second, and Messrs. Backhouse, of York, third, with General Negrier, Sir F. Bathurst, Yellow Standard, Duke of Cambridge, Mrs. Bacon, Crocus, Essex, Triumph, Shylock, Beeswing, Queen of Lilacs, Purple Standard, Privateer, Duke of Wellington, Lord Mayor, El Dorado, Queen of the East, Magnificent, John Edward, Mr. Seldon, Nonpareil, Optimus, the Hero, Princess Louisa, and Mrs. Seldon. For the best 18 Blooms: 1st, Mr. Edward, with Mrs. Bacon, Hero, Queen of Dahlias, Nil Desperandum, Queen of Lilacs, Magnificent (Keynes'), Duke of Wellington, Geo. Glenny, Earl of Clarendon, Lord Mayor, Mr. Seldon, John Edward, Mrs. Anderson, Princess Louisa, Silver Florin, Edward's Magnificent, California, and Shylock. Twelve blooms: 1st, J. Richardson, Esq.; 2d, Mr. Marley, Darlington; 3d, Mr. J. Clarke, Green Hammerton. Six blooms: 1st, Mr. Anderson, Whitby; 2d, Mr. Lister; 3d, H. Watson, Esq. Twelve fancy blooms: 1st, Mr. Edward, with Mrs. Willis, Lola Montes, King Fisher, One in the Ring, Mrs. Hansard, Belle de Peg, Flying Dutchman, Dr. Horner, Miss Pope, Princess Charlotte, Approbation, and Miss Compton; 2d, Messrs. Backhouse; 3d, Mr. Clarke, for Hero, Fearless, Beauty Supreme, Mrs. Bacon, El Dorado, Madame Gobert, Sir F. Bathurst, Danecroft Hero, Queen of Primroses, Imbricata, Fame, and Champion. In class showing, the competition was very close, the winning flowers being chiefly the same varieties as those above-mentioned, Mr. Appleby, of York, showed several trays of Hollyhocks, principally Chater's varieties. Pansies were good for the season; in fact, we have rarely seen Mrs. Beck, Duchess of Rutland (a useful flower in the north), Duke of Norfolk, and France Cycole, in better character. Among the best flowers exhibited, we noticed Duchess of Rutland, Hall's Rainbow, Thompson's Excellent, Helen, Trafalgar, Mrs. Harcourt, Lord Hardinge, Northern Star, White Serjeant, Lady Constable, Sir William Herschell, Conquering Hero, Telegraph, Supreme, Wellington, Addison, Marchioness of Lothian, Voltigeur, Lucy Neal, California, Magnificent, Berryer, Duke of Norfolk, Caroline Androcles, France Cycole, Mrs. Beck, Duke of Norfolk, Helen, Milton, Almanza, &c.

CATALOGUES have been received, with thanks, from Mr. R. J. Kaye, Bury; Mr. H. Groom, Clapham; Messrs. Schofield and Son, Knowsthorpe; Mr. William E. Rendle, Plymouth, and Mr. John Holland, Middleton, near Manchester. *J. E.*

DAHLIAS: *Lector.* It would be impolitic to publish your letter, well written though it be. In the main we agree with you; and when the flower is again under consideration, we shall take an opportunity of noticing the matter. *J. E.*

EXHIBITIONS. Want of space has alone prevented the insertion of several reports of meetings, which otherwise would have appeared; during the past month they have been so numerous that to have given all as they occurred would have occupied one half of our columns. Let not those who have furnished accounts of distant meetings think we are ungrateful for their several favours: it is our desire to give all; but that can only be accomplished by patiently waiting until the necessary room can be afforded for them. *J. E.*

PANSIES: *I H B.* Received with thanks. *J. E.*

PELARGONIUMS: *W E R.* The Transactions are in the hands of the printer, and will be forwarded to you as soon as published. They will afford you the information you require. We had Beauty of Montpellier last autumn; the new variety at your convenience. *J. E.*

### SEEDLING FLOWERS.

FUCHSIA: *R R.* A dark variety of the ultra reflexed class; corolla deep purple, stout and smooth; tube and sepals bright crimson. You should not write on the paper in which the box is packed. In the operation of opening the package, the writing got so much disfigured and torn that we could scarcely make out your initials.

HOLLYHOCK: *J Chater and Son.* A remarkably neat flower, of good proportions, smooth in the outline, and in size below the average.

## Miscellaneous.

*The late Patrick Neill.*—In early life, gifted with a taste for scientific pursuits, Botany and Horticulture became his favourite studies. He was one of those who advanced the knowledge of Scotch Botany, and who along with Don and others added many important plants to our alpine Flora. Throughout life he retained a lively and deep interest in Scotch Botany, and his enchanting garden at Canonmills bears testimony to the zeal and success with which he cultivated the rare alpine species. But while Dr. Neill was thus an enthusiastic practical

* An Hour with the Hollyhock. By William Paul. Pp. 32. London: Piper.

botanist, he was also a most enlightened Horticulturist, and contributed much, by his exertions and writings, to promote the gardening of Scotland. He was one of the early founders of the Caledonian Horticultural Society; he acted as Secretary to that Institution for the long period of 40 years; and it is mainly to his exertions that its present high position is due. With him this Society was always a favourite object, and he devoted himself to it. His exertions were crowned with success, and he lived to see the Society struggle through many difficulties, until it was placed in such a position as to ensure its stability and permanency. Dr. Neill embraced in the range of his study all departments of natural history. He was particularly fond of Zoology, and he always had in his garden living specimens of some of the rarer animals, which were objects of attention to visitors. He promoted the establishment of the Edinburgh Zoological Garden, and in his capacity of Secretary to the Wernerian Society he had many opportunities of advancing the science of Natural History. By Dr. Neill's death one of the links have been broken which united us with the Scotch naturalists of last century. His loss will be deeply felt, for he was beloved by all who knew him, and with all his acquirements he exhibited an innate retiring modesty, which was peculiarly pleasing. He loved science for its own sake, and he did all in his power to promote a love for it in others. His collections were open to all, and his house at Canonmills was the resort of every naturalist who visited the Scottish metropolis. Till within a few months of his death, he was able to take an active interest in his favourite pursuits; and even when he felt that his strength was failing, he retained that calm equanimity which ever distinguished him, and he spoke with composure of his departure from the scene of his labours. His death has left a blank in Edinburgh which will not be easily supplied. He was forward in every good work, and many are the institutions which were indebted to his liberality and kind offices. It is not for us at this time, when the tomb is but newly closed upon his mortal remains, to enter into details of his long-continued and usefully-directed labours in the fields of science; this we reserve till a future occasion, in the meantime simply recording the melancholy death of one of Scotland's best naturalists, and one who has been identified with the history of Scottish horticulture, throughout a period of more than half a century. Perhaps no one has ever done so much for the horticulture of a country, as Dr. Neill has done for ours; and no one has ever shown greater anxiety for the education and welfare of practical gardeners. Scotland has been long distinguished for horticulture, and the skill of her gardeners has caused them to be sought after by parties in all parts of Britain. Much must be attributed to the early education which they receive. This puts them on a high vantage ground, and enables them to prosecute horticulture in a scientific manner, and not according to mere empirical laws. Unless a gardener is intelligent and enlightened, he cannot be expected to advance horticulture. He may continue in a beaten path without knowing the why or the wherefore, but he will not be ready to discard what is wrong although it has antiquity to recommend it, nor to adopt those improvements which the progress of science has suggested. There can be no doubt that the information of our gardeners has increased much of late; the theory as well as the practice of horticulture has been studied by them, and we have every reason to hope that by the enlightened exertions of Horticultural Societies, a new era has dawned, which will give rise to a most intelligent class of gardeners. To no one was the horticulture of Scotland more indebted during the last half century, than to Dr. Patrick Neill, whose loss we now deplore, and, indeed, whose decease is a subject of deep regret to all who feel an interest in horticultural operations. We are sure that the gardeners of Scotland have lost their best friend. In the disposal of his effects, by his will, Dr. Neill has not omitted the Caledonian Horticultural Society, for which he laboured so long. We believe that he has bequeathed to the Society a sum of 500*l.*, for the purpose of founding a medal to be awarded to distinguished Scottish cultivators.

## Calendar of Operations.

*(For the ensuing week.)*

### PLANT DEPARTMENT.

Let immediate attention be paid to the collecting of a good stock of the most useful soils that can be obtained. By getting them into the compost yard at this season, opportunity is afforded of turning and exposing them to the action of the atmosphere during winter, and thus taking advantage of the frost to destroy the insects with which fresh soil naturally abounds. In collecting turf, it is a good plan to cut it during the next two months, and allow it to lie with the grassy side downwards until it has been penetrated by the first frosts, by which all insects will be driven out or destroyed. Before the turf is cut, the herbage should be mown off it as closely as possible; the sods should not be cut more than from 3 to 5 inches thick, as the part next the surface contains the greatest proportion of vegetable fibre; and from having been more freely exposed to the ameliorating influences of the atmosphere, they are in better order for early use.

### FORCING DEPARTMENT.

Pineries.—Keep a constant eye to the bottom heat, as at no season is it more liable to vary, and never is it more essential to prevent such variations, especially with fruit in progress. To assist in maintaining an equable state of heat and moisture about the roots during the winter, it is a good plan to surface the beds about two inches thick with some half spent tan, or leaves taken from a pit where they have heated, and are partially decomposed. This mulching will in a great measure do away with the necessity of watering the roots of Pine plants during the dark months. The quantity of water introduced should be very much restricted, as the evaporation arising therefrom is liable to condense, and run into the hearts of the plants. This evil may, however, in a great measure, be prevented by due attention to ventilation, and by keeping the laps between the glass clean, thus allowing the excessive vapour to be carried off. Where dung linings are used for Pine frames, a covering of mats will be necessary in severe weather; and as these tend to prevent any escape by means of the laps, a little air should remain on all night. Vineries.—Once more we mention the propriety of adopting some efficient mode of protecting Vinery borders from autumnal rains, and the cold produced by the consequent evaporation. However well drained the border may be, and however porous the material of which it is composed, the continual wetting and partial drying of the soil, besides keeping the roots miserably cold and wet, will so injure the texture of the soil that it will cease to part so freely with the surplus water; and as the evaporation is increased, the warmth of the border will naturally decline in a similar proportion. Proceed vigorously with the pruning and cleaning of the Vines from which the fruit is cut, and at the same time let any needful painting or other repairs be done, that the houses may have a neat and finished appearance, and likewise be in perfect readiness for their next year's campaign. By getting this work speedily completed, the houses may be made immediately available for sheltering Chrysanthemums, Geraniums taken up from the flower garden, and other similar plants, which merely require to be protected from the frost.

### FLOWER GARDEN AND SHRUBBERIES.

Now that the summer flowering half hardy plants are removed, make the best amends in your power by drawing upon the reserve garden. All the important beds should be filled with dwarf evergreen shrubs, or spring flowering plants, as Hepaticas, Primroses, Polyanthus, Alpine Auriculas, Wallflowers, &c. These will supply the beds with foliage, and in spring the flowers of the latter will considerably assist the display produced by the Crocus and other bulbs already planted. Dahlias, if so far injured by frost as to be no longer ornamental, may be cut down, preparatory to their being taken up in a few days' time. Tigridias and other summer bulbs may be lifted and laid in a cool dry shed, till they will part easily from their haulm. Salvia patens should be taken up and potted, or planted in a frame of moderately dry soil, where it will keep without any trouble, by merely excluding the frost.

### HARDY FRUIT GARDEN.

Planting and root pruning of fruit trees, where necessary, should now be in progress, to the exclusion of all other work of secondary importance, that as much as possible of this work may be completed before severe weather sets in. Those planted on this side of Christmas have a decided advantage over those moved at a later period; their roots require a very short season of repose, especially if assisted by a little mulching on the surface of the ground, and are in action long before the tops evince the slightest evidence of activity. With regard to soil, the errors most commonly committed are in making it too deep or too good. For Apples, Pears, and all stone fruits, good loam is all that is necessary; it may be mixed with sand or burnt clay, if the loam is too tenacious; and if the whole, or at least a portion of it, has been charred, it will thereby be considerably improved. When any additional stimulus is necessary, it can be supplied in the shape of mulching or liquid manure. The depth of soil should never exceed 12 or 18 inches; and if the bottom is not naturally impervious, it should be made so by artificial means. Where the situation is very damp, let the border for the choicer fruit trees—as Apricots, Peaches, and Nectarines—be made entirely above the ordinary level, as it is well worth while to sacrifice a foot of the height of the wall, if by doing so the remaining portion is rendered more useful. We form platforms of rubble, 6 to 9 inches in thickness, and concrete the surface of it before depositing the soil. This impervious bottom prevents the roots from getting down into the subsoil, and keeps the trees healthy and fruitful.

### KITCHEN GARDEN.

Let Cauliflowers, under handlights, have all the air possible, protecting them only from frost, rain, or very cold winds. Watch closely for slugs, and check their ravages by timely applications of soot. A little finely sifted clean coal ashes is an excellent thing for covering the surface of the soil between young plants of any kind, as our slimy friends have an insuperable objection to crawl over it. The same remarks apply to the Endive and Lettuce planted in frames for winter use. Let dead or decaying leaves be carefully removed, and the surface of the soil, loosened, to allow the free action of the atmosphere. It is an excellent, but by no means a common practice to plant Garlic and Shallots in autumn; the advantage is in their commencing to root immediately, and continuing to grow below ground in all favourable weather during the winter, while their tops are not emitted till the usual time in spring. We have often dwelt upon the importance of this point as a general principle, viz., affording the roots of a plant an opportunity of getting in advance of the tops.

State of the Weather near London, for the week ending Oct. 16, 1851, as observed at the Horticultural Garden, Chiswick.

## Notices to Correspondents.

Back Numbers. Full price will be given for the following Numbers: 1844—46; 1847—9, 25, 51; 1845—49; 1850—44, 49.

Banks: *Gallicus.* We have no experience of such a place; but we presume that Quercus coccifera, Tree Box, Holly, Yew, Berberis aquifolium, Hypericum calycinum, Cotoneaster microphylla, Savin, &c., will succeed—and perhaps Deodars, which could be cut away when too tall.

Birds: *J W.* It is, no doubt, a crested lark, of an unusual size.—*Jane L.* We must refer you to the *Gardeners' Chronicle* of Feb. 15.—*William T.* The average number of years is four.—*W E.* Try ripe Groundsel, and a little hard-boiled yolk of egg.—*Elizabeth F.* Nothing but *warmth* can save your little friend. He has been carelessly exposed to draught during his moult.—*M A B.* Bruise some chalk, and scatter it on the bottom of the cage.—*Charlotte C.* By no means. At this season, baths must be dispensed with.—*Louisa P.* The *vermin* are at work. Peruse carefully what we have already said about them in former numbers.—*Joanna.* They are kind, affectionate birds; and will never quarrel, even though three or more dwell together under one roof.—*Avis.* You *may* succeed by keeping them in a room, at one regulated heat, throughout the winter; not otherwise. *W. K.*

Books: *H.* Moore's "Hand-Book of British Ferns."

Fruit Trees: *J A M.* From what you state, the following selection will most probably suit you. Peaches: 2 Grosse Mignonne, 2 Royal George, 1 Royal Charlotte, 2 Bellegarde, 2 Noblesse, 1 Barrington, 1 Late Admirable. Nectarines: Elruge, Violette Hative, and Balgowan. Apricots: 2 Moorpark, 1 Royal. The border should be trenched, and in doing so mix rich turfy loam with the present soil. ‖—*Novice.* We are of opinion that the decay of Apricot trees is accelerated by excessive dryness at the roots, by sun scorching of the stems, and by mildew on the leaves. The Moorpark, to which you more particularly allude, has very broad leaves, and consequently evaporates more than the smaller-leaved varieties; and in dry seasons, in order to supply this evaporation, the roots soon exhaust nearly all available moisture within their reach, after which the trees must suffer. This should be guarded against by watering so as to thoroughly soak the subsoil; but, in doing this, take care that the water is warmer than the border, otherwise the fruit will either drop or swell badly. It is obvious that scorching can be prevented by shading the exposed part of the stem. Sulphur is the best remedy for mildew. Try the Royal Apricot. ‖

Insects: *Quæro.* The little insects which you mistake for red spiders, and which you found beneath the shrivelled body of a *scale* insect, are in fact the young active state of the latter insect. They have only six legs—red spiders have eight; the latter are in no way related to the Coccidæ. *W.*—*S W.* The luminous worm sent is the Geophilus electricus, not very uncommon, the light being generally emitted about pairing time. *W.*—*Margaret.* The grub you describe which has destroyed your Carrots and Onions appears to be the young state of the common cock-chaffer. If your garden is much infested with it the beds ought to be dug up at once, the earth well turned over, and the grubs picked out, as they will now, very soon, burrow deeper in the ground, to avoid the frost. *W.*

Names of Fruits: *Este.* 2, Yorkshire Greening; 3, Margil; 4, Caroline, very different from either of the Astrachan Apples; 6, Pomme de Neige; 7, Hollandbury; 8, Burr Knot; 11, Doyenné Gris; 12, Beurré Diel. ‖—*T G H.* 1, 2, Blenheim Pippin; 3, Brabant Bellefleur; 5, 6, Mank's Codlin. ‖—*H I O.* The Kerry Pippin. ‖—*Lawneswood.* 1, Beurré Rance; 2, Urbaniste; 3, Williams' Bon Chrétien; 5, Beurré Diel; 6, Uvedale's St. Germain; 7, Napoléon; 8, Glout Morceau; 9, 11, Beurré de Capiaumont; 17, English Codlin; 18, Easter Pippin or French Crab; 19, Keswick Codlin; 20, 23, Minchall Crab; 21, Scarlet Nonpareil. ‖—*F L H.* 1, Beauty of Kent; 2, French Russet; 3, Gloria Mundi. ‖—*F G.* A, Royal Russet; C, F, King of the Pippins; L, R, Alfriston; O, Ribston Pippin; W, Golden Pippin; 2, Ribston Pippin; 6, Court of Wick; 8, Keswick Codlin; 19, London Pippin; 20, 34, None-such; 26, Dumelow's Seedling. ‖

Names of Plants: *Florence.* Common Hornbeam.—*J P.* 1, Anthyllis vulneraria; 2, Gnaphalium germanicum; 3, Serratula tinctoria; 4, Hieracium sylvaticum; 5, Gastridium lendigerum; 6, Psamma arenaria.—*W G L.* Argyreia speciosa, not new, but rare. It is a kind of Convolvulus from the East Indies.—*C L.* Oncidium incurvum.—*K B.* 1, some Desmodium, of no horticultural importance; 2, a Leptospermum; and 3, an Acacia, not determinable without flowers.—*W F.* Pyrus Aria.—*T B.* Tremella mesenterica.

Paulownia: *Vectis.* We had forgotten that this beautiful plant had once flowered at Claremont; and we find that Hampton Court also claims the honour.—*T Davidson.* Yes; your plant is in the same state as that of "Vectis."

The Rhine: *A Constant Subscriber* should consult Messrs. Booth and Sons, of Hamburgh, who can advise him much better than we, who are unacquainted with the little details required to form a correct judgment.

Transplanting: *Constant Sub.* You may transplant your Irish Yew and Berberis aquifolium now with advantage.‡

Misc: *W F.* The ashes of burnt vegetable rubbish will be found a good material for mixing in soil in which plants are potted. When the leaves on the extreme shoots of Camellias assume a whitish-yellow colour, it is either because the soil is too wet and cold, or because it is not sufficiently permeable to air.‡

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS, AS THE ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

THE LONDON MANURE COMPANY beg to offer PERUVIAN GUANO, warranted perfectly genuine; Superphosphate of Lime, Wheat Manure, Concentrated Urate, Irish Peat Charcoal, Gypsum, Nitrate of Soda, and every artificial Manure, on the best terms. Also a constant supply of Salt for Agricultural purposes, at a low rate. English and Foreign Linseed Cake, Rape Cake, &c.

EDWARD PURSER, Secretary, Bridge-street, Blackfriars.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Clover Manure, per ton ... ... ... ... | £11 | 0 | 0 |
| Turnip Manure, do. ... ... ... ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per ton, in dock. Sulphate of Ammonia, &c.

MR. J. C. NESBIT, F.C.S., F.G.S., Consulting and Analytical Chemist, Laboratories, 38, Kennington-lane, London.—PRIVATE INSTRUCTIONS in Chemical Analysis, and the most approved methods of making ARTIFICIAL MANURES. Analysis of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

BIRMINGHAM CATTLE SHOW, 1851.—The Certificates of Entry for CATTLE, SHEEP, PIGS, and POULTRY, are now ready, and, with the PRIZE LISTS, may be had on application to Mr. EDWARD LATHBURY, at the Office, No. 2, Insurance Buildings, Union Passage. Intending Exhibitors are particularly requested to mention the nature of the Stock for which they require Certificates, as a separate form is necessary for each Entry.

Attention is also requested to the regulations, as set forth in the Prize Sheets, that no entry can be received for Cattle in Classes 1 to 13 inclusive, or for any of the Classes of Sheep or Pigs, without the Breeder's Certificate, in all cases in which the Exhibitor is not the Breeder also.—The Entries close on SATURDAY, November 15. T. B. WRIGHT, Hon. Sec.

Birmingham, Oct. 18.

SMITHFIELD CLUB, 1851.—CHRISTMAS FAT CATTLE SHOW.—Prize Sheets and Blank printed Forms of Certificates may now be obtained, on application to the Honorary Secretary.

The last day for receiving Entries is SATURDAY, THE 15TH NOVEMBER, 1851.

THE ANNIVERSARY DINNER of the CLUB will take place at the FREEMASONS' TAVERN on the WEDNESDAY of the Show Week, instead of the Friday, as heretofore.

B. T. BRANDRETH GIBBS, Hon. Sec.,
Corner of Half Moon-street, Piccadilly, London.

BAKER'S PHEASANTRY, Beaufort-street, Kings'-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street, London.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much Improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description; but to those who have not seen them in operation, prospectuses will be forwarded, as well as references of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the Kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected on the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

MILK, CHEESE, AND BUTTER.

HENRY BAKER, OPTICIAN, 90, Hatton Garden, London, advises any one who keeps Cows to send two postage stamps, and obtain a description of his LACTOMETER, with its uses, and the results of experiments with it upon different Milks. Lactometers, complete, in a mahogany box, 10s. 6d.; Do., with cheaper fittings, 7s. 6d. and 5s.; Hydrometers for testing sulphuric acid, 5s., 7s., and 10s. No consumer of acid should be without one, as it is often sold highly diluted. Saccharometers for Brewing, with tables, 5s., 7s., and 10s. Pediment Barometers, from 1l. each. Wheel Barometers, from 1l. 1s. each. Packed carefully for the country, there being nothing to fear of them getting out of order, as they are warranted to be properly made and good instruments.

**The Agricultural Gazette.**

*SATURDAY, OCTOBER* 18, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
THURSDAY, Oct. 23—Agricultural Imp. Soc. of Ireland.
THURSDAY, — 30—Agricultural Imp. Soc. of Ireland.

WE would advise those who think that PLOUGHING with a pair of horses has been adopted in all districts in the south of England which are capable of being so ploughed, to visit the county of Kent. They will there see the turn-wrest plough with its four, and even six horses flourishing in full vigour, as in the days of the Heptarchy. Let them then cross the river into Essex and Suffolk, and they will see soils not only of the same quality, but much stronger, ploughed well with a pair of horses. The arms of Kent are a white horse, and its motto "*Invicta*." There is the utmost propriety in both: ACTÆON was not more completely devoured by his hounds than Kentish agriculture by its horses; and the prejudices of the men of Kent in favour of their ancient and cumbrous implement, seem to be all but invincible. They appear to cherish it as one of the Saxon privileges, for the preservation of which they stipulated in their celebrated treaty concluded with the Norman at Swanscombe.

Some 50 years ago, MARSHALL remarked on the paucity of live stock kept in Kent; and speculating as to the quarter in which a market was found for the green crops grown there in such profusion, arrived at the conclusion that it was no other than the stables of the farm yards, with their numerous pampered horses, kept always in a state "fit for the butcher;" and that there the whole of the Oats, Beans, Clover, Sainfoin, and Lucerne, which were grown without end, entered a sink which was never closed. A little relaxation is good for editors as well as other people. We therefore in the course of last spring made a tour into Kent; and enjoyed the opportunity of seeing, on the farm of a friend, the performances of the turn-wrest plough in preparing a Turnip fallow. The land had been ploughed and manured in the autumn, and was receiving its second furrow. The soil was a loam with a few dispersed flints,—strong enough for Wheat, not too strong for Barley or Turnips, or for feeding off the latter on the land. We had cultivated a soil as strong in an adjoining county, where three horses were the order of the day, with two-horse ploughs; and our regular day's work, under the same circumstances, would have been an acre and a quarter to each plough, ploughed in furrows 7 inches deep. The field which we saw ploughed in Kent, contained by estimation 10 acres; by actual measurement, we found it rather more than nine acres and three quarters. Four teams were brought to bear on it during two days, and three during one day; each team consisting of four horses, which we were told were worth 60*l.* each; and beautiful horses they certainly were, short, compact, clean-legged, and by nature active. Any two of them would have been capable, if not so fat, of doing more work than was performed by the four. The keep of our horses consisted of two bushels of Oats each, weekly; to which was added, in seed time, half a bushel of Beans. They had no hay in the racks, but received it all in the manger, cut into chaff, one-third by weight of Wheat straw, to two-thirds of hay. With this food they were always in good working condition; so good, as frequently to draw from our neighbours inquiries as to how they were fed, that they looked so much better than their own. We never learned how the horses of our Kentish friend were fed; and we question whether in this respect he had much the advantage of us; his men helping themselves to hay, and thinking it no robbery to steal corn from their master's barn for his own horses. However they were fed, they were fit for the butcher; each team was attended by two *men;* for the drivers were quite old and strong enough to have held the plough themselves. The force thus employed in ploughing these ten acres with furrows not more than four inches deep, was, as we have said, equal to eleven days' work of one four-horse team. With the same number of men and horses we should have ploughed, with two-horse ploughs, not less than 27 acres. Our friend carries his produce to market in the same expensive style, with four of these horses to a waggon; and do not their bells jingle merrily as they enter the town of —— on a market-day? We should add, that he complains bitterly of the times, and is confident every farmer in the land will be obliged to take refuge in the gaol or the workhouse, unless the price of Wheat can, by hook or by crook, be raised 5*s.* a quarter. He wanted an additional 5*s.* when he was ploughing his Turnip fallow in April, and the averages were something above 39*s.*; and we found him still wanting 5*s.* at the meeting of the Royal Agricultural Society at Windsor when they had risen to 42*s.* 6*d.*

But there is progress even in Kent. We travelled on the North Kent Railway, with a party of Kentish farmers, by whom the usual round of agricultural topics was discussed. To our surprise we found one of them maintaining, against the others, the practicability of ploughing the Kentish soils with two horses. For the sake of argument, we espoused the opposite side of the question; and were referred by him to a farm of good stiff land, which, however, we had not time to visit, where he said we might see the two-horse ploughs in successful operation. Before we left the county we visited another Kentish farmer whom we had not seen for more than 10 years. We had then hinted at the practicability of reducing the number of horses employed in Kentish farming, and were told it was impossible "on our soils." "They are more difficult to plough than they seem. Your little kickety ploughs have been tried, but they won't do." A marvellous change had now come over our friend. We remarked to him that we had seen some iron ploughs, not at work, however, in one of his fields which appeared designed for two horses. "No," he replied, "for three. We have knocked off two; if we had not, we should not be able to keep our heads above water in these times." In other respects, 10 years had wrought a wonderful alteration in our friend. He would then hear of no manure but good rotten dung; and despised light manures as much as he despised light ploughs. At our recent visit he entered into calculations to prove that—if London dung were given to him for nothing, delivered at the water side, within six miles of a hilly farm—the carriage, with the filling and spreading, would cost more than the purchase, carriage, and distribution of as much guano and bone-dust as would produce crops equally good. In another 10 years, we have no doubt, he will have adopted two-horse ploughs. Time is an important element in agricultural improvement. We know by experience the annoyances attending their introduction in a new district, arising from the prejudices of the men. The difficulty of overcoming these, causes many farmers to adhere to the old system of three and four horses, who are convinced in their own minds that their land might be ploughed with two. There is a silver key, however, which will open the most intricate lock more effectually than the celebrated American locksmith. An extra shilling or two of wages for the man who works a pair of horses soon reconciles the ploughmen to the innovation, which would be cheaply purchased by giving him all the wages paid to the driver, and saving only in the article of horse keep. When we undertook to cultivate a farm in a neighbouring county to Kent, with two horses, the agricultural oracles of the neighbourhood gave us three years to drag the plough along the surface; and instances were adduced, to the great terror of the landlord, who imagined we should spoil his land, in which the same thing had been attempted and failed. We persevered, however, for 14 years. It was admitted by that time by the more candid of our neighbours, that our ploughing was as good as theirs; and some of them even began to use two horses occasionally, when giving a second or third ploughing.

A regular hob-nail farmer from another three-horse county, who succeeded us, adopted the two horse ploughs without a moment's hesitation, as a great improvement; and has persevered in the use of them for 20 years. There has been in the interval an Agricultural Society established in the district. At the ploughing matches of this Society there are now prizes given for ploughing with two as well as three-horse ploughs; and at those matches quite as many of the former start as of the latter. It will be the same in Kent some 30 years hence, as well as in some other districts, which still rejoice in their three and four-horse teams, and which we are told cannot be ploughed with less strength.

ERRATUM: The word printed "write" in the 42d line of last week's leading article was *written* "wish." Read therefore "'Long live Prince Albert,' say all who *wish* for the advancement," &c.

## THE STEAM PLOUGH.

I OUGHT not to have required your renewed invitation to 'develop a little further my ideas of Steam-cultivation.' But if I were to begin making excuses for silence, you and the readers of the *Gazette*, who got their eyes once entangled in my letter, would soon find yourselves in a labyrinth of explanation which I would rather try to cut short with the old Persian motto that "Speech may be silvern, but silence is golden." In other, and short, words,—I have been purposely silent; because I would rather the subject developed itself; as *I am sure it will*. I have received several private communications, of most interesting reference to my last letter, but which I have found it impossible to answer personally: Life is not long enough for an extra-daily correspondence, if its ordinary duties are to be fulfilled; at least as the penny postage has bequeathed them.

But besides this, I have a sort of mysterious indescribable faith in *slowness*. Everything great and true in its time, has been hard at the birth. And I have a heavy troublesome leaden conviction on my mind, that won't give way, by day or night, that my idea on this same subject of steam-engine agriculture is utterly true.

But it is one thing to see a matter as plain as a pike-staff before your own eyes, and to put it into language very simple to your own mind prepared to understand it, and a very different thing to make it intelligible to those who have never given any express attention to it before. The fault may be just as much in the writer as the reader: and with this assurance I have blamed myself, in self defence against the loss of patience that has sometimes threatened me, when I see the unaccountable misinterpretation of my meaning, which some of my correspondents have disclosed. I have had to wade

through page after page close-written to prove how clearly and fundamentally the writer misunderstood the whole purport and principle which I had endeavoured to convey. I will try to re-state the whole question.

Before the discovery of Steam-power, and its application to machinery, there was *no such thing* as a mechanical power that could be carried about, and applied where and when and how you pleased, *except animal power*. The plough, the spade, or the hoe (with their varieties), were the only possible modes of effecting the task of cultivation. The comparatively recent discovery of steam-power altered the condition of human life in this particular. The modes of action to which cultivation was before limited, and which are exemplified in the use of the three instruments just named, became, on the discovery of steam, *no longer* the necessary and only modes of performing the act of tillage. From the nature of things it was morally certain that whenever that new Power was applied to this act, it would be through an instrumentality as different from the plough, as the plough was from the spade. If a man will only give himself the trouble to think how total a revolution the application of steam effected to the navigation of a ship, and the locomotion of a carriage, he cannot very well fail to see what is meant by the saying that *a new Power requires a new process*. It is a solecism in art, as well as science, to attempt to yoke steam on to a plough. There is no affinity between them; any more than, as I said once before, between a horse and a spade.

I have found it inexpressibly difficult to get this leading postulate clearly and once for all understood. Till it is so it is hopeless to attempt to proceed. The idea of an instrument to be *dragged through the soil*, as a plough is, from one end of a field to another, poisons more or less, not every, but nearly every communication I have received. To those who have understood the matter thus far, I shall seem tiresome in again insisting on it. How difficult it is to *un*learn !

When the attempt was first made to run Steam-Carriages on common roads, it was soon found that however good a Macadamised surface might be for a wheel to *roll* upon, under a Carriage *drawn* by horses, it broke away into a perfect Gravel-bed when the new Power instead of pulling the Carriage which set the wheels simply *rolling* underneath, *laid hold of the Wheel itself*, and produced the locomotion of the vehicle by forcibly driving the wheels round. The very best road gave way under the severe friction of this new mode of producing locomotion, and so did the tires : and nothing could be done till both road and wheel were made of solid iron. *The new Power required a new process.* Instead of pulling the Carriage it drove the wheel, and in driving the wheel it tore up the stones even of a Granite road.

Now put on your Agricultural Spectacles, and apply this parable. When Steam-power is brought into the field, (audiat qui aures habet !) it will "play out this play" over again. Its faculty and virtue consist not in pulling vehicles or implements, but in *driving wheels* : and when Steam-driven wheels will tear up Granite roads into shingle and gravel, and move the Carriage too, (for so it did, only not fast enough for modern travellers,) what forbids the hint being taken by the "audax Japeti genus," that have happily applied so many accidental hints before, and the same refractory Giant being set to rasp up cleverly and methodically with sharpened Mole-like claws, the tender soil, when he has shown his ability to tear so tough a one with the mere *palm of his hand ?* And what forbids, either, that he should spare off a little of his redundant steam in moving his own carcase along, meanwhile, at a pace of little more than half a mile an hour ? "What you save in speed you gain in power ;" and an instrument as broad as Crosskill's Clod Crusher which completes the *whole* work of tillage, as it moves along, will hardly be required to go much faster. At that speed it would cover four acres a day—not of 'ploughing,' not of 'harrowing,' not of 'rolling,' not of 'scuffling,' not of 'rolling *again*,' 'cross-ploughing,' 'clod-crushing,' 'rolling *again*,' 'ridging up,' 'sowing,' and 'harrowing in' ; but of *all* these epithet processes in one Comprehensive act—and word—Cultivation.

"I am a Farmer on a very large scale in Jamaica," writes a recent Correspondent, "having four Estates cultivated on my own account, and nearly 30 others over which I have control. *There* we put from 8 to 14 oxen to a plough, with four people in attendance ; and many good Agriculturists of this Country, who have gone out to manage their own Estates, or those of others, have tried in vain to improve on this abomination. We have an obstinate and most independent peasantry to deal with, who have us completely in their power, and work or not as their fancy takes them, and on their own terms ; for Nature is so productive, and land so cheap there, the stimulus to exertion is wanting. You may conceive then the *cost* of ploughing and pulverising an acre of land ; and when the idea of doing this by Steam has been talked of, I have always said 'If Steam can compete with one man and a *pair* of horses here, what would it do in Jamaica against 12 oxen and four people, *moving* half an acre a day,' (for in some parts of the island not a man is seen in the fields after mid-day.) * * * * I cannot grow the (Sugar) Cane *properly* unless I can give the land a *Garden* Culture. My principal Estates are a rather strong Clay, on Limestone rock and at various depths : had I an instrument such as you describe, I could grow three Hogsheads of sugar where I now grow *one*. Coals with us are little dearer than in London : we get them nearly freight-free."

Is it not astonishing, with occasional facts before us such as these, and some not very far behind them at home in England, that since the first introduction of Steam power to the notice and assistance of mankind, nobody has ever yet attempted to apply it *in its own way* to the definable and simple work of cultivation. It is put to cut chaff, to make sawdust, to granulate powder, to make pins' heads, to reduce all sorts of *coarse material into fine*—and all by wheels,—*circular motion*, and nothing else, for nothing else will it accept,—but nobody can persuade their minds to believe that by the self-same action, and no other, it can cut up a ribbon of soil 8 inches deep and 6 feet wide, and leave it behind granulated to as coarse or fine a texture as the nature of the seed or season may require, and inverted in its bed. It is not ploughing, it is not digging, it is not harrowing, raking, hoeing, rolling, scarifying, clod-crushing, scuffling, grubbing, ridging, casting, gathering, that we want : all these are the time-honoured, time-bothered *means* to a certain Result. That result is—a seed-bed : and a seed-bed is, simply described, a layer of soil from 6 to 12 inches in depth, rendered fine by comminution, and as far as possible inverted during the process.

You may call this 'Theory,' my good Mr. Practical, (whoever you may be,) but I tell you it is Truth : simple, obvious, philosophical, practical Truth. *Since the Invention of the Steam Engine*, it might and may be done *at one process*, as easily as before by 20 ; and it will be. Before you depart this life, you will see one more wonder moving upon the face of the earth, something of this form and fashion—to wit—a complete locomotive engine on four wheels, with tires 10 inches broad, and slightly corrugated cross-wise on the face, the fore wheels turning on a transome, the hind ones fixed ; behind them (suspended) a transversed, cylindrical shaft, 3 feet in diameter, from 6 to 8 feet long, reminding you of a cross-breed between a clod-crusher and a hay-tedding machine, armed with case-hardened steel tine-points, in shape like a dog's claw, each tine-point alternately long and short, so that the side-lap of each claw may cover the work of the other, and no interval or ridge be left uncut : the extremities of the cylinder just covering the wheel-tracks. This formidable-looking cylinder of claws you will see raised or depressed at pleasure by the engine-driver, and adjusted to slow or rapid revolutions, not worked by cog-wheels, but by one of the new metallic bands, geared from the drum of the Engine. That is the "cultivator." A platform from the Engine extends over it, ending in a sort of moveable tail-board, which may be raised or depressed at pleasure, to regulate the settlement of the soil which scatters from it. The revolution of the cylinder is not *against* but *with* that of the wheels, not dragging or retarding but helping the advance of the whole machine, which is moved slowly forward (about half-a-mile an hour) by a detached force of about two horse-power from the same Engine. *C. W. H.*

## SEWAGE MANURE.

For some time now, the theory of applying the sewage matter of towns to arable lands at any distance, by means of steam-power through pipes, has been a favourite one with not a few ; but experiments, as far as they have been tried, leave it a question more problematical than ever to practical men. We are afraid that the many favourable reports and conclusions, published on this important question, have been rather hastily arrived at, and that the only available purpose to which liquid manure can be applied, in the moist climate of Britain, is that of irrigation on Grass lands. Here we can enumerate safe practice with some degree of confidence ; but this rainy-weather system of manuring appears more and more objectionable as we approach it.

Many overlook the fact that the theory of irrigation is different from that of warping or liquid manuring ; for, says one, look at the fertility of the valley of the Nile ; at our water-meadows, says another ; the practice of China and the Netherlands, says a third ; and who can doubt the practicability of applying the whole of our sewage matter to our hungry soils with success, thereby rendering us entirely independent of a foreign supply of corn and cattle. The truth of the old adage "That muck is the mother of meal," cannot be questioned by the most sceptical of the old school, and from the amount of manurial element in sewage, the conclusion is obvious, that were it applied to the soil, the increase of produce would fill our barns to overflow—so much so, that we would have to pull them down, and build larger. Such is the train of arguments which we meet with on this national question ; but the first and grand argument with practical men is, to get hold of the increase of produce ; and here experiment has failed to prove that sewage matter applied on the rainy-weather system is the mother of meal. Such being the result, the next question which naturally arises for solution is, Why does such and such a practice succeed in one place, and not in another ? And the answer which promptly follows is, Because those who have applied the liquid in England are blockheads, clinging to antiquated habits, with such a degree of tenacity, that they cannot discern the true heory of manuring. To apply, for instance, the nozzle of the sewage pipe to "a ripe Gooseberry bush !" Who ever heard of the like, a hundred miles from London ?

With all our shortcomings, however, the true answer to the above question, Why does such a practice succeed in one place, and not in another ? is simply this ; the practices themselves are wholly different. The overflowing of the Nile in Egypt, for instance, is a different practice from the irrigation of our meadows, the irrigation of our meadows from the liquid-manure system of Flanders, and the liquid-manure system of Flanders from that practised by the Sewage Manure Company of the metropolis. Of these differences we need not say a word. The two practices which approximate the closest to each other are those of Flanders and the metropolis ; but although the difference here is less than between them and the others, yet it is by no means inconsiderable ; for the Flemish farmer finds from experience that liquid manure is worthless, comparatively speaking, unless it undergoes a certain degree of fermentation—a process which the sewage matter of the metropolis does not undergo ; consequently, the practices are not parallel, nor the latter experiment a fair one, accounting it may be practically for its own failure. It may be said, by way of objection, that fermentation is unnecessary ; but objections of this kind go for nothing, for it would be just as opportune to tell the practical Flemish farmer that fermentation is a waste of time and labour, as tell the English farmer that he may expect great things from sewage manure, so long as experiments show the contrary. Under such circumstances, chemical analysis is of no value with practical men, and with scientific it certainly ought not to be otherwise. The grand question, therefore, before us, resolves itself into the following, viz. :—If the sewage matter of towns underwent the same degree of fermentation as it does in Flanders, would it produce the same fertilising effects in the more humid climate of Britain ?

In the Netherlands, China, and other places where the liquid manure system is successfully practised, a system of tanks is required, so as to allow a period of eight or ten days' fermentation. To carry out this practice, therefore, we must either have a system of huge tanks in the metropolis, and other towns, or else at every farm and garden in the country, before it can be successfully effected ; and we fear that in the former, sanitary results would arise as a serious barrier to the reduction of such a proposition to practice ; and that in the latter, expenses scarcely less formidable in character to success. Granting, however, that both these obstacles are overcome, we have still two important ones remaining. Would the liquid-manure system suit the moist climate of Britain ? And, is the liquid-manure system of Flanders the best that can be adopted for that country ? To both these questions we are apprehensive that a negative answer must be given, for the following, among many other reasons :—On the best cultivated farms in Britain, more loss is generally sustained from an excess of moisture than from a deficiency ; and consequently, if this excess were to be increased, the loss would be still greater. This is perhaps more particularly the case with corn crops ; but green crops are by no means exempt from injury from moisture, for both are liable to suffer, not only in the early stages of their growth, but also when they are approaching towards maturity. In the former, weeds not unfrequently spring up, exhausting the soil, and choking the young plants ; and in the latter, lodging, rotting, &c., is the result. Now, under such circumstances, the application of liquid manure would not only increase the evils arising from an excess of moisture, but also reduce the temperature of the soil to a degree still more injurious to vegetation, while in the absence of the liquid during heavy rains the plants would suffer more than they now do from a want of food ; and hence be less able to bear up under such unfavourable weather.

Again, if soils contain an abundance of those manurial salts which crops require, and if they are naturally of a carbonaceous and aluminous character, they will absorb from the moist atmosphere of Britain a sufficiency of moisture to supply the wants of plants ; and, in the generality of seasons, more than a sufficiency. If such soils are properly drained, cultivated, and manured with solid manure, there will rather be a tendency to an excess of straw than otherwise, and hence a deficiency of corn. It is only in exceptionally dry seasons that the crops sustain injury during the months of June and July ; and even in these years losses are experienced, the greatest on soils previously injured from an excess of moisture. Cold clay lands inevitably suffer more than open friable loams from drought, so that in both extremes a deficiency of straw is the result of an excess of moisture. If the lands have been in proper tilth during April and May, it is seldom that any injury is sustained from drought during these months ; but if drenched in rain, clays are liable to become baked, and loams less or more injured from sudden changes. To keep the soil open in spring, free from stagnant water, consolidation, and full of manure, are the grand desiderata to avoid the calamity of scorching in June and July. The principal crops which suffer are those put into the ground at this season, such as Turnips. These frequently suffer in the first stage of their growth ; but even here, with a sufficiency of manure in the soil, the application of clean water would just be as salutary as sewage, and much less expensive. Now, under such circumstances, experiments are against the daily watering of Turnips, setting aside the expense ; for generally where it has been tried mischief was done. To hold the watering pan an hour over each plant daily would be a tedious process, and yet we know from experience that if a shower of rain falls sufficiently fast to saturate the soil during the months of June and July, in less than an hour it will inevitably do harm. On the other hand, if there is not a sufficiency of manure in the soil, the daily application of it in a soluble state, so as to suit the growing demands of plants, is, to say the least of it, a very nice theory. To us it appears very problematical whether the daily supply of food should come

from the same tank during wet weather as during dry—during the first stage of the plant as during the last; but on the anomalous character of the liquid system in this respect we shall not dwell.

Lastly, silicious soils appear those best adapted for the liquid system, and we believe it is on them that the success of both the Flemish and Chinese practices have been founded. But even on such soils it appears very problematical whether an application of charcoal and clay would not be more efficacious than so many waterings. The old adage "Lay clay on sand and you buy land" pronounces its award in favour of the former practice. The effects which clay produces when laid upon such soils is very remarkable. The field from which it may have been taken may be burnt up, and also the portion of the silicious field to which it has not been applied, while that part to which it has been applied may be growing luxuriantly. In the case of tenacious clay soils, the application of sand is equally beneficial, producing similar results; so that, without stopping short to find fault with foreign practice, we have data sufficient to establish the only sound practice for the moist climate of Britain.

The conclusion, therefore, at which we arrive at is, to drain lands requiring it effectually, and plough deep, keeping the clod-crusher going when required, so as to admit of the free circulation of the atmosphere to the roots of plants, and to apply solid manures suitable to the different crops. To increase the absorbent powers of silicious soils, by applying clay, &c., so as to effect a permanent improvement, is the second practice to be carried out, so as to avoid the more expensive system of continual waterings, during the scorching months of summer; and, on the contrary, to increase the porosity of tenacious clays, by the application of sand, &c., is the most advantageous, to avoid their baking in the sun. In all cases where sewage matter can be applied to Grass lands, on the irrigation principle, the practice is undoubted; but where this cannot be done, the proposition of separating the manurial elements from the aqueous, by means of charcoal, &c., recommends itself. A very valuable portable manure may be formed of the liquid manure of the farm, the sewage matter of towns, &c., and charcoal, especially for starting Turnips and other plants during the scorching months of June and July, and putting them beyond those dangers to which they are subject. The proposition is deserving of our support. We have oftener than once recommended experiments, anticipating favourable results; but until a series of well-conducted experiments decide the question, satisfactory conclusions cannot be arrived at. Until this is effected, our most sanguine expectations belong to the regions of theory only. To get a manure which would retain moisture in a greater degree, and absorb it from the atmosphere, than any one we now possess, for starting Turnips, and similar plants, would be a most important acquisition. *W. B.*

## THE INDUSTRIAL EXHIBITION.

Farm Buildings.—Among the objects in the agricultural department, and elsewhere, were several models of farm buildings; those of Mr. Mechi, among others. We would at present only refer to those of Mr. Baxter, of Lewes, and of Oaklands Farm, Sussex, in which the principle of covering over a given extent of land, and dividing it out among the efficient purposes of a farmery, is adopted. Not being able to present a plan of this building to our readers, we shall just select from the description which accompanies the model passages on particular portions deserving of remark.

*The Pig-sties.*—The plan adopted with them is to secure cleanliness and warmth by having the flooring formed of Memel deal laths, 1⅛ inch thick and about ½ inch apart for small pigs; 1 inch for middling size, and 1½ inch for full size, and this being raised 2 or 3 feet, the manure falls immediately through and is collected on inclines below; the liquid runs away to the manure-tank, and the solid is removed to the covered manure-yard adjoining. Some prefer a small pit underneath, in which they place ashes, which, when well saturated, are fit for top dressing or drilling. The food is kept in two covered cisterns or tubs, one on each side, between which is placed, in front, a moveable plank resting on the frame of the cisterns, which forms a platform for the purpose of a feeding road, and which, when one end is let down, and the cistern closed, forms a road to the sties for the ingress or egress of the pigs. The cisterns are partially sunk in the ground, even with the platform or feeding road.

*Manure Tank (underground) and Pump.*—It is proposed that connecting drains shall run from the cowstall, stable, piggeries, &c., into the tank; from thence it may be pumped into the manure cart for distribution, or turned with the aid of a shoot, or gutta percha tubes, upon the manure heap in the yard, where composts of various descriptions may be made. The models are upon a much smaller scale than was intended, but as Mr. Baxter was late in his application for space to the Commissioners, only 2 feet 6 inches in length could be allotted to him; but this may be sufficient for the practical man to see the general system of arrangement, as the same plan can, of course, be carried out on any scale, so as to suit various sized farms. No 1 is of square construction, and appears of a more familiar character than No. 2, but the arrangement of the latter is to suit a different ground plan. Each of the buildings contains precisely similar departments and conveniences, so that a general description of one of the models will be all that is necessary. Of course these buildings may be erected of any material suitable to the locality. The estimated price of the same is given in the last page.

In proceeding to the erection of these buildings, the ground in the interior should be prepared with a fall from the highest end through the whole extent, to facilitate the drainage, and if the surface were well puddled or rammed with clay, it would be better prepared to receive any kind of paving; bricks will be necessary in the stable, whilst in the cowhouse, passages, &c., concrete will answer the purpose. The passage which leads down the side of the long building, and the centre of the square one, will have a main drain formed of open drain tiles leading to the manure tank, with connecting branch drains to the horse and cattle departments. The smaller drains in the stable may be of cast iron, similar to those in cross street pavements, with a small opening, an inch wide, along the upper surface; they would not then interfere with the horses' hind feet. With neat stock, an open drain, as usual, may be best. Excepting from the cows the dung may be moved in the usual manner, but in the model the cowhouse adjoins the dung yard, so that the manure may be thrown into it through an opening in the wall. The building is 8 feet from the floor to the eaves, and 25 feet in width—a size sufficient to accommodate six cows in each row, with a passage leading through to all the departments. This will be large enough for a moderate sized farm; but if the occupation is extensive, the long model may have another corresponding range by its side, the centre being supported on posts or pillars. This arrangement doubles the size of every department, and as one centre passage would be sufficient, three or four feet would be gained in the additional portion. The short model could also be on an enlarged scale; in fact, the dung yard cannot be too large, and if the covering of the whole yard is too expensive, an open space adjoining would be very convenient. Large barns are not considered so necessary as formerly, as corn is thought to keep better in stacks; and since the introduction of threshing machines it is more convenient. We have proposed no special department for threshing machines or steam power, but these could easily be added, if required, and under the same succession of roofing; ventilation will be found amply provided for by the doors and windows in the building, but if there is any doubt about it a few air bricks in the walls or perforated zinc will have a good effect. The escape of the vitiated air may be by means of louvre boards, or openings in the ridge tiling.

## Home Correspondence.

*Granite.*—When resident some years ago in the Highlands, it occurred to me that the vast masses of granite in that country could be converted into manure—that is to say, that the felspar and other silicates of potash and soda could be so treated as to render soluble in water the potash, soda, and silex; thus making them an available and valuable food for crops. The readiest way that occurred to me of doing this, was to stratify the granite with alternate layers of carbonate of lime (limestone) and coal in a lime kiln, and burn the whole together, as lime is usually burned. I expected in this process that the granite, being made red-hot, would easily receive any chemical impression from another agent, that the carbonate of lime would be decomposed; that its liberated carbonic acid would seize on the potash and soda of the granite, forming soluble carbonates; that the silex would also become soluble, either in the form of silenic acid, or that it would combine partly with the lime, and that the greatest part of the granite would, when thus soluble, be an extremely valuable manure. I tried the experiment on a large scale—that is, in a lime kiln, and the changed granite I spread upon the land; unfortunately I left the Highlands before a sufficient time had elapsed for me to observe its effect on the crops, and a severe illness prevented my making a chemical analysis of the products of the kiln; but, this much I can say, that the burned granite melted down in the rains; indeed, in a very few days it became disintegrated and pulverised by the action of air and moisture; and I have not the slightest doubt but that it had been rendered soluble by combination with the carbonic acid in the heated kiln. Being now resident in a chalky, gravelly district, where no granite exists, I have had no opportunity of carrying out my experiment as I should wish; the best thing, therefore, I can do is, to give publicity to the theory and practice (as far as it went) in hopes that some one having the opportunity may try the effect of this new manure on various crops. Should it succeed in the manner I believe it will, what an inexhaustible store the farmers will have of a valuable manure! A learned professor said, "I was going to turn Ben Nevis into a dungheap," and truly there is no romance in the expression, for chemically it is possible. I should mention that the granite must be broken into lumps not larger than a cricket ball, for I found all above that size unaltered in the centre, whereas all of smaller size melted completely away. *Martyn Roberts, Woodbank, Gerrard's Cross, Bucks, October 7.*

*Cultivation for Corn.*—It is a curious fact, and not easily explained, that whilst improvement has constantly of late years been making in the machinery and implements of the farmer, and notwithstanding that ploughing is done with half the strength, and the produce is prepared and marketed at half the cost, of 70 years ago, there are many instances of land being worked with the spade, and without the advantages of machinery, competing in its returns with the most intelligent farming. To what is this owing? The last edition (the 8th) of the Rev. Mr. S. Smith's work, "A Word in Season," informs us that his sixth running crop of Wheat has yielded upwards of five quarters to the acre, and a margin for rent and profit of 8*l.* an acre. What farming with the plough approaches the spade husbandry? The only explanation I can offer, and this accords greatly with my own experience, is, that whilst the farmers have been seeking reduction of cost in their ploughing, they have been overlooking the value of deep cultivation and fine comminution of the under strata into which the seed has to push its roots. I have long seen the value of the Kentish turnwrest plough, which breaks up the bottom and sifts the crumb it makes underneath; and after using almost every plough, I still work it whenever I think the crop will be the better for two or three inches of fresh soil, a pulverised bed, and a permeable subsoil, in place of five or six inches of block and a hard pan underneath, left by the cutting ploughs, which will not allow the roots to go any lower. I had the pleasure of seeing Mr. Smith's crop in the spring, and I was much struck with it; I spoke of it when looking at the crops of one of our finest agriculturists, where Wheat was all drilled 14 inches apart, and with only three pecks of seed on an acre. The impression on him of what I told him I had seen, was such that he immediately had an acre of his Wheat measured off, and every other of the rows upon it dug in, so that on this acre the Wheat stood in rows at 26 inches apart, and only with 1½ peck of seed to the acre. The effect very soon showed, although the Wheat of the field presented an appearance of luxuriance I believe seldom seen. Still this acre was distinguishable by its superior growth, and it became apparent in the summer there would be far too much to stand till harvest, and such proved the fact; for before harvest its great length of straw brought it to the ground. The fault was over luxuriance. Here the grower had to complain of his land being too rich—a fault it does not cost money to cure; and to what was this owing, but to the larger amount of food opened to the roots by the turning in of the intermediate space. The value of such instances as these lies not so much in them as examples to follow, as in throwing light on the mysteries of vegetation, and showing the importance of better cultivation. We are here taught how land may be enriched—not by costly manures, but by more effective labour; and, if rightly viewed, we shall see from Mr. Smith's crops, and the instance mentioned, the direction to which our attention should be turned for giving greater fertility to our land. Numerous instances in confirmation of these examples present themselves to me. I can but mention two. A large landed proprietor, desirous of clothing the open ground round his house, planted, about 30 years ago, numerous clumps of trees—anxious to give a rapid growth to those nighest his mansion—for many years had their beds turned in annually. These took the lead, and are now double the size of the beds that were not so treated, and have had to be thinned five or six times; and there can be no question, on looking at the two, that the extra growth has more than doubly repaid the labour upon them. The other case is that of a farmer, in Hertfordshire, who, having a poor side of a field that he could not make productive, one winter, 20 years ago, being overseer, put all the able paupers to work upon it in trenching it; and this side of the field has ever since been the most productive of the two. These are cases I can vouch to; but who is there that does not know the difference that an old garden or Hop-ground ever shows; it cannot be the manure, for the difference is seen after any number of years; it lies in the greater depth given by the culture to the plants to feed from. *Hewitt Davis, 3, Frederick's-place, Old Jewry, London, Oct. 13.*

*Prices of Goods in* 1810 *and those in* 1851.—Cottagers are now fully sensible of the reduction of prices of articles of food and clothing, and speak of the advantages they derive at present by Sir Robert Peel's measures. That statesman said, "he hoped his name would be remembered amongst the poor and humble." "Sir," said a cottager, "had prices continued high for food, there would have been open rebellion in the country." But the rural population are surprised at the cheap clothing, as well as feel the advantages of cheap food. One of these cottagers gave me the prices of articles used by them 40 years ago, and what they pay now. Many now living are not aware of the difference of cost of articles of consumption by the peasantry. They will interest many, no doubt:—

*Disease in Poultry.*—There have been several inquiries lately in your Paper, as to the best antidote for disease in poultry. As I have had some little experience in this way, a few hints may not be unacceptable. In the first place it is of the greatest importance that the henhouse be kept perfectly clean. I litter the bottom with straw, occasionally sprinkling unslaked lime on the

flooring; this has the effect of keeping it dry, and the straw breaks the fall when the birds jump from the perch, which, in the case of Cochin China poultry, should be low, or from their great weight they are likely either to break the leg or strain the sinews; a hen ladder is generally recommended, but I never could make my birds use it in descending, and therefore use the straw, which can be shaken for some days, and the refuse removed; it afterwards makes capital manure. The water should be given fresh every day, and during moulting a few rusty nails or pieces of iron are very advantageous, as they strengthen the bird, and enable it to shoot the new feathers with greater ease. The food I give mine is as follows: good sound Barley and Wheat, as much as they can eat, once a day; after that I give them steamed Belgian Carrots, broken up, with Barley-meal; and when these cannot be obtained, Barley-meal or toppings. Grass or other green food is indispensable; I also give my birds a full meal of boiled rice every other day, and about twice a week bullock's liver cut into dice. When the chickens are first hatched, the best food is egg boiled hard, and crumbled with bread or fine toppings and a little Barley-meal; and at the same time I give off-corn Wheat, with a few split grits; this food, if given for a fortnight, will forward the chickens in an extraordinary manner; after that time, Barley-meal mixed hard, with water, is very good food, with boiled rice and Wheat. Should chickens, whether young or old, seem at any time ailing, they should be immediately attended to; for never does the old adage, "a stitch in time saves nine," become more necessary than in the case of poultry. They should have, first, some sulphur and cayenne pepper, mixed with Barley-meal, given them, and afterwards, for a full-grown bird, a tea-spoonful of the following mixture, in the same medium, night and morning:—Elecampane fœnugric, liver of antimony, aniseeds, cummin seeds, linseeds, and cayenne pepper, all in powder, mixed in the proportion of equal parts, except the last, of which there should only be half used. It is necessary, however, that the powder be all what is called true—compound powders being frequently used, as the public have a great inclination for cheap drugs, and are consequently supplied therewith, and are disappointed when they find them inefficacious. The above recipe I had given me by a lady who had lost a large number of chickens previous to its use; but since its administration has been very successful. Many persons in this neighbourhood have lost a large number of chickens this season; but wherever they have used the above they have been free from disease, and it is not a bad plan to give a little once or twice a month, to keep the birds in health. I have hatched a considerable number of Cochin China chicks this season; and by giving the above mixture occasionally, I have not lost one, and have maintained my stud in capital health. P.S. I have seen several notices in your Paper lately, of white Cochin China poultry; surely these must be some other breed, as I have seen a great many of the birds, and the colour has invariably been either a dark bay, cinnamon, or partridge colour; for myself I prefer the bay and cinnamon, with very full pluffy thighs, and feather-legged. *Henry Copland, Chelmsford.*

*Prices and Yield of Wheat in South Hants.*—The Wheat crop of this year has proved as I mentioned to be, about an average one, and there is much "tailing" Wheat—about 3 bushels to every 10 or 11 sacks. Last year half a bushel to 10 sacks of best Wheat was about the average. Prices have fallen from 10*l.* to 11*l.* per 5 quarters, to 8*l.* 10*s.* to 9*l.* for the new Wheats. The prices given depend not so much upon the London market value, but what the grower can be prevailed upon to sell it at—a poor farmer will sell his load of Wheat for a pound sterling less than the market value for ready money. Disputes as to weight ought at once to be put an end to, by a rule to sell by weight rather than by measure. This would obviate much unpleasant feeling between both parties. We find 20 sheaves or thereabouts will yield one bushel of Wheat; 15 sheaves are the average. One farm produced 1000 sheaves an acre; at 20 sheaves to a bushel, this would yield 12½ sacks per acre. But 14 and 16 sacks per acre have been grown some seasons. The average quantity of sheaves per acre is 400 to 600, according to the nature of the soil—and no less also to the variety of Wheat sown, suited to a particular soil; in this there is a result, vastly important to farmers, and requires particular attention. It makes a difference of actual rent—no slight matter just now. The Wheat crop is not so good in yield as last year; though the weight per bushel is greater, the corns are smaller. *X. Y. Z., Hants.*

*Winter Flax.*—Permit me to direct your attention to the seed of the winter Flax (see "Official Catalogue," No. 70, Austria), from Laybach, Carniola, and to the following information derived from a member of the Austrian agency in the Exhibition. "The seed is sown in October; shortly after the seed leaves appear the snows of winter securely cover it till the following spring, when the plants grow with great rapidity, and are fit for pulling in May or early in June. This variety is also cultivated in Bohemia and Moravia." I have written to a gentleman in Trieste to procure me some of the seed, and I hope to be able to report on its growth on my own farm and others in this county (East Lothian), and in other parts of Scotland; the want of a covering of snow will, I fear, prove fatal to the plant; but if the trial is favourable, it will give an impetus to the growth of Flax; for annual weeds, which prove so detrimental to the profitable cultivation of really good Flax, even on well farmed land, are seldom injurious to winter sown crops; and, moreover, the Flax may be cleared off in time for a crop of Turnips. But it is chiefly with a view to its introduction to Canada, Nova Scotia, and New Brunswick, in which the climate bears some analogy to that of Laybach, that I have ventured to address you. If it proves hardy in British North America, the inhabitants will have good cause to bless the Great Exhibition. The specimen of Maize deposited on the same table as the winter Flax, also from Laybach, may prove valuable to these colonies—those districts at least which border the zone at which that valuable plant is cultivated. I pointed out these seeds to Mr. Tuckerman, of the United States agency; he gave me his hearty thanks, and resolved that both experiments should be tried. When in London I knew not how to bring the matter before those parties who are, or ought to be, more particularly interested; but now I rest assured that it will receive that attention from you which it deserves. *Archibald Hepburn.* [The sample is not distinguished by its appearance from common Flax, and its character is probably a habit, derived, like that of winter Tares, &c., from treatment.]

*Wheat* at 4*s.* and 4*s.* 3*d.* per bushel, the present market price, will not pay the farmer for growing. If the land is to be kept in tillage, a remunerating crop must be substituted, and such is to be found in Flax (according to practical men), which has hitherto been considered to exhaust the soil more than any other, a mistake originating in ignorance of the system required in its cultivation. England pays somewhere about 5,000,000*l.* to foreign countries for a material we can, with a little trouble, grow ourselves. When Wheat was 60*s.* a quarter we could afford to purchase Flax; but now grain is reduced to about half, agriculturists must turn their attention to something more profitable. There may be some difficulty in inducing men to change their crops; however, a few experiments will soon prove the wisdom of following the example of farmers in the north of Ireland. It will be necessary to establish mills for preparing the Flax for the manufacturers, so as to be within reach of the farmers, as the value of the crop depends upon having the means of dressing the fibre in the quickest and best manner. When is the best time for sowing Flax? [Mid-April.] What soil suits it best? [Adhesive loam.] How should it be sown, broadcast or drilled? [Broadcast.] What treatment does it require when growing? [Weeds must be pulled.] Is there any cheap publication for distribution, giving a plain account of the manner of cultivating Flax? [Many have been reviewed in this journal.] *Falcon.*

*Draining.*—The subject of draining is one of very great importance to the farmer, and must not be passed over hastily or capriciously, because some individuals take a different view of the subject from others. I have read the letters of Mr. James Donald and Mr. Gill in your Paper of the 27th of Sept. and 4th of Oct., and I cannot but think that Mr. Donald jumps a great deal too fast in drawing his conclusions. I will not go into the subject with these gentlemen now, because I hope to see something further from the Rev. Mr. Wilkins; for that gentleman's letter on the subject, which preceded those of Mr. Donald and Mr. Gill, certainly appears to require something further in elucidation of his views; and if they will have the patience to wait I have no doubt Mr. Wilkins will favour us with an explanatory statement. I feel very confident that Mr. Wilkins will be able to make his ground good; for he is not a likely person to have entered on the subject, had he not have been thoroughly satisfied with the correctness of his views; and the readers of your Paper well know that he has not only the ability and power to combat any false reasoning, but that when the gage is once thrown down, he has always the courage to take it up. *W. W. I., Branthan, Oct.* 6.

*Temperance.*—In a late Number of your Paper "E. F.," of the Phœnix Park, Dublin, made some excellent remarks on the propensity of the labouring classes to drink beer. He therein expressed a wish to have medical authority on the subject. If medical testimony will settle the point, it ought to be settled at once; as there is a testimony signed by nearly 2000 of the most eminent of the medical profession throughout the United Kingdom, testifying that wine, beer, cyder, and intoxicating liquors of every description, are injurious to a healthy person. If your correspondent has any doubts on the subject, he may send three postage stamps to the office of the Scottish Temperance League, 30, St. Enoch-square, Glasgow, and I am sure they will furnish him with a copy. *A. K. G., Oct.* 8.

*Cultivation of Beans.*—A neighbour of mine, a farmer, last spring had a piece of land that was sown with Beans, and missed; he asked me if I thought they would do any good if he should sow more. I said "Yes;" he dibbled some more in, and when he was having them cut he asked to come and see them. They came up very thin, and he wished me to see the difference between them and the others which were thick. The Beans were very superior both in quality and quantity on the thin sown ones. Another farmer joined us, and we began to talk about the cultivation of Beans; they seemed to agree rather with me in thin seeding, but when I said I thought they would grow more Beans and better quality with planting them far enough apart to use the horse-hoe betwixt them, they both turned against me, saying it would be an extravagant waste of ground; I said no, not so much so as they seemed to think; they should consider the benefit constant stirring the soil would be—I thought it would be almost as good as a fallow for the next crop; but they contended that stirring the ground was useless, except to kill weeds. They say that the only thing a fallow is made for is to get the land fine and clean to receive the seed; and in doing that, you waste the food for plants, and every time land is stirred it gives off a great quantity of ammonia and absorbs none, and if it lies still it parts with none. If you spread manure on your ground, they say, and let it lie, it will soon all be gone into the air. "Yes" I said, "that's true, some of it would, and the first shower of rain that came would bring most of it back again." "Yes, but let every one keep his own," they said. Now, according to them, I have put my employer to a great deal of needless expence; for, weeds or no weeds, I have always used hoes made on purpose to well cultivate the ground between crops; if I have been wrong, I should be thankful if you, sir, would put me right by your opinion in the *Gazette. J. W.* [We agree with you, and should take your side of the argument with your friends.]

*Potatoes on the East Coast of Kent.*—I have just come home after a week's close inspection upon about fifty fields round the Isle of Thanet, where scarcely a haulm was to be seen but what was dying prematurely, and wherever they were digging for market, one, two, and sometimes three tubers were diseased. I told all of them to dig them all up, that as soon as the wet weather set in half and more would go bad, but the only reply I had was, "Did I think so." The Potato growers in the Isle of Thannet this year have escaped entirely through the dry weather; having had no rain for five weeks up to about September 25th. If the Isle of Thanet growers cannot escape with such famous soil, fine salt air, and altogether a fine southern clime, what can be expected from a north and less favoured counties? If a Potato is worth growing at all, they must pay as much attention to it as any other crops—that is, at getting up time, select their sets, and green them properly. The meaning of greening is that the tuber imbibes certain gases by light and air; and when put into the ground to grow, the stem grows much more woody than after a blanched tuber, and especially after white, covered up, closed up Potatoes, strawed and moulded all the winter; they are altogether changed in their system by being greened (see my pamphlet), and I have proved that a hundred times. This year, when I was planting out a piece of late kidneys wintered upon my plan, in February, I sent for a peck of the Ash-leaved Kidneys, the shoots of which had been rubbed off, and the skin white; the row was planted in the middle of the piece, to give them every chance; they did not come up for a month after the others, some did not come up at all, but formed small insipid tubers without a stem, the others mostly were strong, the shoots very succulent. The late Potatoes were all dug up on the 9th of August, quite ripe. The row of Ash-leaves were also dug up nearly ripe; but one row of the others would have equalled three of the Ash-leaves, had there been three. This experiment was seen by the *Chronicle* reporter, and hundreds of other persons. But I am sorry to say that I found the market gardeners and growers whom I spoke to in the Isle of Thanet were not readers. I examined two garden allotments, one at Ramsgate, East Cliff, the other at Minster; those persons seemed greedy for information, if they could get it. I made them a present of a Potato pamphlet, and they promised to lend it amongst each other. The one on the cliff is a hungry worn-out soil, and very much exposed to all weathers; this is let at 6*d.* a rod; the inland one, a first-rate soil and situation, at 4*d.* a rod. But I am certain that the tailors, shoemakers, and sailors, will beat the Minster ones, because they are more eager for information. But, as I have a good deal more to say upon garden allotments, I shall defer it at present, and to those who have allotments I shall be much obliged if they forward to me their systems, in order to see if something perfect cannot be arrived at, for nothing would improve the labouring classes faster than properly managed allotments. *James Cuthill, Camberwell, Oct.* 1.

*Draining Companies.*—I am sorry to trouble you again, but in printing the article on "Draining Companies," in a late Number, 500 acres are substituted for 100 acres in calculating part of the costs, making the sum total 1537*l.* 10*s.* instead of 537*l.* 10*s.*—the expense named (or intended so to be) in my last observations for draining 100 acres of land by the "General Land Drainage Company." I will only further observe that, if 7*s.* per acre is to be added to this sum for commission, as specified in Mr. Shelley's last letter and unnoticed in my last, it will make the sum total to be paid: Interest on 572*l.* 10*s.*, when 500*l.* is borrowed—and the liquidation at 6¼ per cent. will be 35*l.* 15*s.* per annum for 50 years, which gives at the expiration thereof 1787*l.* 10*s.* I think before the money is applied for, the borrower will do well to ascertain the expenses, as illustrated in the "Abstract of the Company's Act," published by themselves, at page 8 to 13, and if he can obtain such detail as will fix the expense to a limited sum, he will be in a position to decide. *A Tenant for Life, Sept.* 30.

*Agricultural Statistics.*—In your Paper of the 4th of October, you complain of the want of agricultural statistics, and say that no one can say with confidence whether we grow twelve millions or twenty-four millions of quarters of Wheat annually. This has long been a matter of astonishment to me; and, as a beginning of a better system, I beg to propose that the number of acres in Wheat (as well as other farm produce), should be returned by the churchwardens and overseers of every parish, to some office appointed for the purpose. This would cost little, and we should in time be able to deduce something valuable from it. Even if we knew the actual

quantity grown this year, it would do us no good, until we could compare it with other years. *T. G., Clitheroe.*

*Messrs. Wrench's Samples of Seeds.*—I was glad to see, at p. 634, a notice of Messrs. Wrench's collection of British grown agricultural produce. The museum of Messrs. Lawson is a perfect study for those who are anxious to examine all the varieties of corn, seed, Grass, woods, &c., known in Scotland; but as a practical man, having some thousands of quarters of corn through my hands in the course of a year, I consider Messrs. Wrench's assortment the most useful. I see there at a glance all the well known and favourite corn and seed of the London Corn Exchange. The samples are for last season first-rate, especially the Chiddam Wheat grown by Mr. Henry Currie on his property at West Horsley, near Guildford, and which I consider quite equal, if not superior, to the Prince's sample, and regret with you that this collection arrived too late for competition; as, from its true practical and national character it is just what was wanted in this class by the foreigner, and our fellow countrymen living far away from London. *Sam Slick.*——We find a paragraph in your *Gazette* of the 11th October last, signed "Tuesday," to the following effect:—"I beg to suggest that it might be interesting, and also useful, to the unlearned, if Messrs. Wrench were to sell collections of seeds such as those exhibited by them," alluding to our collection of Wheats, &c., in the Crystal Palace. We do not exactly understand what the writer means, but we shall be happy to supply collections of Wheat seeds, &c., of the same varieties as those exhibited by us. We are not aware of any difficulty in this. *Wrench and Sons, London-bridge.*

## Societies.

Manchester and Liverpool Agricultural Show, *Oct. 6 and 7.*—This show was the fourth of the amalgamated societies, and the second held in Manchester; meetings having also taken place at Liverpool and Warrington. The trial of implements commenced at noon on Monday, in a field near the Trafford Arms Inn, Stretford. There was a large attendance, and the trials occupied about five hours. The implements submitted were very numerous, and each was tested. The most important contests were between some two-wheeled ploughs, with the latest improvements, and some of the swing ploughs peculiar to this district. The soil was in good condition for testing the instruments; and, on the whole, they were all considered to get through their work in a very creditable manner. The judges considered that the wheeled ploughs had a decided and striking advantage, when it was required that furrows of a greater depth than 5 inches should be produced; but the swing ploughs worked in a very satisfactory manner to 5 inches depth, for which they are in general specially constructed. A dynamometer introduced by the society was upon the ground, and its use brought out several results, important to the conduct of agricultural labour. Although no striking difference in the draught of the best ploughs of either kind was discovered by the use of the dynamometer, yet the value of the instrument was strikingly exhibited, by the very serious increase in the draught of ploughs, which it showed from an improper or careful adjustment of the different parts, or from general bad gearing. In many cases it was shown that work could be more efficiently performed, with from 10 to 20 per cent. less draught power, after proper arrangement of the parts of the ploughs; and in a few cases a much greater saving was effected. The prize for general work was given to a two-wheeled plough by Gascoigne. The show of cattle, &c., took place on Tuesday morning, on a spacious plot of ground adjoining York-street, Hulme, which belongs to Mr. S. Brooks, and was some time since walled round, with a view to its being converted into a general market for Hulme and its neighbourhood. The previous show was held in a very confined place, near the Victoria Railway Station; and the contrast between the appearance of the old and new ground, and the immense accession of convenience to exhibitors and comfort to visitors, was very generally and warmly remarked upon. The collection of cattle and implements was fully equal to that at Warrington last year, far superior to any ever before brought together in Manchester, and was considered to augur well for the future success of the Manchester meetings, which have usually been considered to a great extent failures, as compared with those of the Manchester and Liverpool and other societies, in different parts of this and the adjoining counties.—The horned cattle were numerous, and comprised some first-rate specimens. The prize in Class I., for the best bull of any breed, above two and under four years old, was gained by a short-horn belonging to Mr. T. Birchall, of Ribbleton-hall, near Preston. The prizes for short-horns were awarded to Mr. H. Ambler, of Watkinson-hall, near Halifax; and Mr. J. B. Case, of Poulton Hey, near Birkenhead. Messrs. John Forrest, of Stretton, and Thomas Forrest, of Antrobus, near Northwich, were the successful exhibitors of bulls, in the classes for tenant farmers; and to Mr. T. L. J. Brooke, of Mere Old Hall, near Knutsford, two prizes were awarded, although he was the only landlord who exhibited. It is to be regretted that the landlords did not manifest their interest in the improvement of the breed of cattle, by coming forward more readily, as exhibitors; for the object to be gained, it should be remembered, is far greater than the silver medals offered by the society, or the honour which attaches to their presentation. In Mr. Brooke's case, the judges considered that both the beasts exhibited possessed much merit; and a prize was awarded in each instance, although the usual course is not to give a prize where there is only one competitor for a premium. Mr. Ambler and Mr. J. Forrest received other prizes for cattle than those mentioned above.—The cows were much commended by the judges, especially those exhibited by tenant farmers, with respect to which some difficulty was felt in deciding which of the two (for dairy purposes) should be declared the better; Mr. James Gorton, of Seedley, Pendleton, received the first prize, however, for a short-horn; and Mr. J. Crowther, of Blackley, the second prize, for a cow of the same description. The prize for extra stock (horned cattle) was given to Sir T. J. de Trafford, for a splendid four-year-old bull. The show of horses was good, in point of numbers; but, with the exception of some few of the stallions, and others, for draught purposes, it was not generally considered first-rate. A chestnut gelding, belonging to Mr. T. Hoyle, of Haslingden, was much noticed and admired; and received the prize "for the best mare or gelding in actual use in the district as a roadster," and Mr. Robert Brown, of Farleigh Wallop, Hants, gained the prize with a very fine animal, shown among the stallions for dray purposes. The most noticeable feature among the display of sheep were some very fine specimens of the Southdown breed, exhibited by Viscount Hill, of Hawkestone, near Shrewsbury, who is said to be the first breeder in this part of the country, for this particular kind of stock, and who succeeded in carrying off three or four of the prizes. Mr. William Ellison, jun., of Sizergh, near Kendal, exhibited some very good rams, as well as several shearling Southdown ewes and Leicester ewe lambs; and he gained several prizes. The pigs, a first-rate collection, were, in the opinion of many, superior to any ever before seen in Manchester; certainly some of the beasts were enormously large and obese. Several of the successful exhibitors were residents in Manchester, although they were not generally the breeders of the stock they had contributed to the show. The show of vegetables and seeds was not large. Mr. Edward J. Pemberton, of Sankey Lodge, near Warrington, gained the society's silver medal, offered for growers of the best specimens of yellow or red Wheat. Some of the Wheat, shown in the straw, was much noticed for the great size and weight of the heads, and the remarkable length and good colour of the straw. There were some very fine specimens of Mangold Wurzel; together with a dozen enormously large and heavy Scotch Cabbages. Messrs. F. and J. Dickson and Co., of Manchester, exhibited a collection of seeds, &c., including some of the best and finest seed Wheats from Scotland. The display of agricultural implements was large and interesting, although there was, perhaps, nothing that had not been seen at some of the more recent shows in different parts of the country. In the collection exhibited by Messrs. C. D. Young and Co., of Liverpool, the things which attracted most notice were Drummond's anti-metallic churn, the merits of which are evidenced by the fact that it had gained the prize at the meetings of nine agricultural societies before being exhibited here, and was similarly honoured on Tuesday; and various sizes of an improved cast-iron rick stand, combining the advantages of being very easily fixed or removed, affording great freedom of ventilation, and preventing the access of vermin to the crop placed upon it. Messrs. Richmond and Chandler, of Salford, had among their implements very compact and useful chaff-cutting machines, of different sizes; an improved apparatus for steaming Turnips, hay, chaff, &c., for horses and cattle; and a patent double action Turnip cutter, which can be used either for cutting for sheep or slicing for cattle. A very good collection of implements was also shown by Mr. H. Bennett, of Liverpool, the most important among them being Sillar's new clod-crushing roller, which is said to possess advantages over existing implements of the same kind, both in the facility with which it cleanses itself, and the small amount of power required for its efficient working; a model of an improved steaming apparatus, which can be easily arranged and effectually worked, either to a greater or less extent, at the option of the manager; and several improved Gorse, hay, &c., cutters, of various kinds. Among the other exhibitors were Messrs. N. Gascoigne, Thewless and Griffith, William Harkes, David Harkes, H. Kearsley, W. H. Peake; Lee, Ross, and Co.; John Whitehead, Lynch and Inglis, &c. Two or three machines for tile making, both for agricultural and sanitary purposes, were exhibited in operation.—The following were the judges for the different descriptions of stock:—Horned cattle: Mr. John Booth, Killerby, near Catterick, and Mr. John Patterson, Hall Beck, near Ulverstone. Horses: Mr. George Hunt, Preston, and Mr. B. Cartledge, Market-street, Sheffield. Sheep and pigs: Mr. W. Torr, Aylesby, near Grimsby, and Mr. W. Henlock, Great Ouseburn, near York. Implements, seeds, and roots: Mr. John Hannam, Kirk Deighton, near Wetherby, and Mr. Thomas P. Outhwaite, Bainesse, near Catterick.—At the dinner, in the Corn Exchange, the Right Hon. the Earl of Wilton, who presided, proposed "Success to the Manchester and Liverpool Agricultural Society." He laid claim to no more knowledge on agricultural subjects than ought to be possessed by every English gentleman of the present day; and he would not therefore take up their time by pretending to give an opinion which system of draining or cultivation was the best. He had reason to think that it had been extensively believed that previous to the enactments of 1846, and which were supposed to have stimulated to great exertion the efforts of the farmers, that that class in England had been deficient in skill, energy, and enterprise; but long before those enactments, English farmers did succeed in raising a greater amount of produce per acre than had ever been raised by others in Europe, or even in the United States. In France, where the best system was pursued, the produce was about 16 bushels per acre, and in the United States about 13; but recent Parliamentary returns showed that in England, at the time of the close of the American war, the produce was 20 bushels per acre; and that, partly owing to the good understanding subsisting between the landlord and the tenant, partly by the exertions and enterprise of the English farmer, and mainly, perhaps, owing to the assistance and encouragement of agricultural societies, the produce of the land of this country had been increased in 1846 to an average of 32 bushels yearly, per acre. The same returns also showed that, while the population had increased 32 per cent., the produce of this country had, during the same period, increased 46 per cent. During the last 10 years, too, above four million hundred weight of guano had been imported from the ports of the Pacific, for the purposes of manure. He mentioned these facts, because a great deal had been said about the want of skill, energy, and enterprise, on the part of the English farmer, before the enactments of 1846; but at the same time it could not be denied that important improvements had taken place since that period. He believed that it was generally acknowledged that agriculture, in this neighbourhood, was in a tolerably flourishing condition; but this circumstance could not be considered as a test of the real state of agriculture in the purely rural and corn districts of the country—because he was satisfied of the correctness of the opinion he had before expressed, that the tenant farmers who held land surrounding agricultural towns were pretty nearly in the same condition as market gardeners near the metropolis. While the most eminent statesmen, and the most learned private individuals, differed so widely as they now did as to the correctness or otherwise of the policy of 1846, he thought the agriculturists had nothing to do but to wait the issue of the great experiment then commenced. But he was free to confess that in 1846 he feared that the unrestricted importation of foreign produce would have the effect of reducing prices to such an extent as to barely, if at all, leave the cultivation of land profitable; and the present prices of corn, added to the burdens that now rested exclusively upon the land, led him to fear that in the agricultural and corn-growing districts it was hardly possible for the tenant farmer to make any profit at all, or for the landlord to claim that return in the shape of rent to which he was clearly and justly entitled. He had also dreaded—connected and attached as he was to this town and neighbourhood, and intermingled as all his interests were with the prosperity of the manufacturing districts—lest when our enterprising manufacturers met with successful competition abroad, they might find, too late, that they had lost their market for their goods. He could only hope and trust that his fears and anticipations upon this subject might not be realised. In common fairness, however, they ought to look to and consider the condition of their brother agriculturists who did not possess the advantages which those in this district enjoyed; for he believed that all whom he was addressing would agree with him in considering the state of agriculture in this district to be an exceptional one. In conclusion, he would say to those present, "Exert yourselves to the uttermost, relax not in your efforts, for these are not days in which men can stand still." Let landlords and tenants, agriculturists and manufacturers, pull together, then we might rest assured of the fulfilment of that great object to which we were all looking, namely cheapness of cultivation and increased produce of the soil, and then we should also ensure that which he would now propose to them as a toast, "Success to the Manchester and Liverpool Agricultural Society."

## Reviews.

*A Word in Season; or, how the Corn-Grower may yet grow rich, and his labourer happy.* Eighth Edition. J. Ridgway, Piccadilly.

The present edition of a pamphlet with which our readers are already well acquainted, contains a postscript, dated September 1851, and an appendix, with plain directions for carrying out the plan of Wheat growing of which the pamphlet speaks. Our extracts embrace portions of both these addenda.

"The outlay and the produce for the present year, 1851, being now ascertained, the account (per acre), stands thus:—

| | £ | s. | d. |
|---|---|---|---|
| Ploughing (12*s.*) the half portion of the acre ... ... | 0 | 6 | 0 |
| Harrowing, levelling, and cleaning the foul stubble... | 0 | 10 | 0 |
| Pressing the channels ... ... ... ... ... | 0 | 1 | 0 |
| Dropping the seed by hand ... ... ... ... | 0 | 5 | 0 |
| 1 peck and ½ of seed (in round numbers) ... ... | 0 | 2 | 0 |
| Rolling ... ... ... ... ... ... ... ... | 0 | 0 | 6 |
| Hoeing the rows, scarifying the intervals, bird keeping, and all the operations down to harvesting and marketing ... ... ... ... ... ... | 2 | 0 | 0 |
| Rates, taxes, and interest ... ... ... ... ... | 0 | 10 | 0 |
| Total amount of outlay ... ... | £3 | 15 | 0 |
| Five quarters and 1 bushel of Wheat (at 35*s.*) ... | 8 | 15 | 0 |
| Two tons of straw (at 40*s.*) ... ... ... ... | 4 | 0 | 0 |
| | 12 | 15 | 0 |
| Deduct outlay ... ... ... | 3 | 15 | 0 |
| Total amount of profit to proprietor ... ... ... | £9 | 0 | 0 |

*Directions for Carrying Out the Plan of Growing Wheat.*—"I suppose at the outset the land intended for Wheat, to be Wheat land; having besides a fair

depth of staple, and a subsoil—as will generally though not universally be the case—of the same chemical composition with the surface. I suppose it dry; or drained 3 feet deep at least; well cleaned of weeds; the lands cast; and the whole tolerably level.

"1. First of all, then, plough the whole land, when dry, 1 inch deeper than the used staple. If it turn up cloddy, bring the clods down with the roller or the crusher. Let this be done, if possible, in August. Harrow deep; so as to get 5 or 6 inches of loose mould to admit the presser. Before sowing wait for rain. After the rain wait for a fine day or two to dry the surface. With this early commencement, a week or two is of no material importance compared with that of 'ploughing dry and sowing wet.'

"As early as possible, however, in September, get in your seed with the presser-drill; or with some implement which forms a firm-bedded channel in which to deposit the seed, grain by grain, a few inches apart. Cover over with the crusher or rough-roller.

"2. When the lines of Wheat appear above ground, guard against the rooks, the lark, and the slug; a trite suggestion, but ever needful, especially here. And now, and at spring, and all through summer, watch for the weeds and wage constant warfare against them. The battle may last for a year or two; or in some foul cases even more; but, in the end, the mastery, and its fruits, without fail, will be yours.

The plant being now distinctly visible, dig the intervals two spits deep; increasing the depth year after year till they come to 20 or 24 inches. Bring up at first only 4 or 5 or 6 inches, according to the nature of the subsoil, whether tenacious, or loamy, or light. To bring up more at the outset would be a wasteful and injurious expense.

"The digging is done thus: before proceeding with the work, a few cuts are made within 3 inches of the Wheat,—the back of the spade being towards the rows. A few double spits, first of all, at the required depth, are then thrown out on the headland, and there left for the present. After this, as the digging proceeds, the staple is cast to the bottom, and the subsoil thrown gently on the top. This process is carried on throughout the whole interval; at the end of which interval, just so much space is left vacant as was occupied by the soil thrown out at the beginning of it. In commencing the second interval at that finished end, the earth is thrown out as at first; not on the headland, however, but into the vacant space of the first interval. And so on all over the acre.

"4. Late in winter and early in spring watch your opportunity, in dry weather, before the roots of the plant are laid bare, to press them with the crusher.

"5. In the spring and early summer, stir the spaces between the rows as often as the surface becomes crusted over; and move the settled intervals 4 or 5 inches deep with the common scarifier, set first of all about 28 inches wide; reducing the width till it come by degrees to 24 and 18 inches. Continue the process, if possible, at the last-named width, up to the time of flowering in June.

"These operations are indispensable to full success; and, happily, can be carried on at little cost. For, while the intervals of each acre can be scarified in 50 minutes, the horse-hoe implement, covering two lands at once, can stir between the rows in 25 minutes.

"6. Immediately the crop is carried, clean the intervals, and move them with the scarifier, in order to sow, without delay, the shed grains. When these vegetate and come up into plant, move the intervals again, 5 or 6 inches deep, and so destroy them. After that, level with the harrow implement; and the land is ready for the drill.

"7. If anything occur to prevent the sowing early in September, and to drive you to the end of October, set the drill for a thicker crop. But, if possible, sow early. For this reason; tillered Wheat has a bad name. But that has reference only to Wheat which has tillered late in the spring. And certainly, in that case, there is the fear of danger to the crop, and damage to the sample. For, supposing no mildew to fall on it, even then the plant ripens unevenly; the early stems being ready for the sickle, while the late-grown shoots have scarcely lost their verdure. But, if mildew come, when the straw is soft and succulent and porous, instead of being, as it should be at that time, glazed and case-hardened against its attacks, the enemy enters in and checks the circulating sap; and the end is, blackened straw, light ears, and shrivelled grain. Therefore, sow early. Let the plant tiller before winter. Give every stem an equal start at spring. And then, with a strict adherence to rule, there need be no alarm as to the result, subject only to those visitations from which no Wheat on any system, on the same description of soil, and under the same climate, is secure."

## Notices to Correspondents.

Churn: *An old Subscriber.* The old barrel churn, for 40 lbs., is as good as any.

Food required by Cattle: *Devoniensis.* What would the carcase of *that* ox weigh, if the animal were fat instead of lean? Divide that weight by four, the quotient is probably nearly the weight of green food, such as Turnips, Clover, &c., which that animal will eat per diem, if it be fed on green food only.

Machine for Milking Cows: *A Lady* begs to know whether any of our correspondents has used the new invention for milking cows, and with what results.

Micaceous Sand: *Usk.* That is what it is; it probably is from one of the beds of the old red sandstone.

Poultry: *W W R P.* White guinea fowls are scarcer, but not more sought after than the usual colour. The belief (and I think a correct one) is, that, in common with other white poultry, they are more delicate, and consequently more difficult to rear.—*T G K.* I know nothing to make unusual care and knowledge necessary to rear Cochin China fowls; therefore any work treating on poultry generally will give the necessary information. The best and most copious work is by the Rev. E. S. Dixon, entitled "Ornamental and Domestic Poultry," published at the *Gazette* office. *J. Baily, 113, Mount Street.*

The Farm Buildings Bill: *W C.* It was brought in by Mr. Baillie Cochrane and Mr. Forbes, and ordered to be printed on the 28th of May last; never got further than the committee, where it was so altered as to be useless. The Chancellor of the Exchequer spoke against it, and of course it was finally lost. *J. G.*

# Markets.

## COVENT GARDEN, Oct. 18.

Peaches and Nectarines are about over for a season. English Pines are large and fine. Grapes are abundant. Dutch Hamburghs are still imported in considerable quantities. Pears are also brought from the Continent. The best English kinds are Gansel's Bergamot, Brown Beurré, and Marie Louise. These fetch from 2s. to 4s. a doz., and 8s. to 12s. per half sieve. Damsons are almost over St. Michael Oranges may still be obtained. Nuts remain nearly the same as quoted last week. Some Spanish ones have made their appearance. Carrots, Turnips, Cabbages, &c., are sufficient for the demand. Potatoes are generally good in quality. Lettuces and other salading are sufficient for the demand. Mushrooms are scarce and dear. Cut flowers consist of Heaths, Pelargoniums, Mignonette, Heliotropes, Stephanotis, Bignonia venusta, and Roses.

### FRUIT.

| | |
|---|---|
| Pine-apples, per lb., 3s to 6s | Almonds, per peck, 6s |
| Grapes, hothouse, p. lb., 2s to 5s | — sweet, per lb., 2s to 3s |
| — Lisbon, per lb., 9d to 1s | Oranges, per doz., 2s to 4s |
| Peaches, per doz., 6s to 12s | — per 100, 14s to 30s |
| Melons, each, 1s to 4s | Nuts, Barcelona, p. bsh, 20s to 22s |
| Damsons, p. half sieve, 6s to 7s | — Brazil, p, bsh., 12s to 14s |
| Apples, kitchen, p. bsh., 1s to 1s 6d | Filberts, per 100lbs., 70s to 90s |
| Pears, dessert, p. doz., 2s to 4s | Walnuts, per bush., 12s to 24s |
| Lemons, per doz., 1s to 2s | |

### VEGETABLES.

| | |
|---|---|
| Cabbages, per doz., 8d to 1s | Garlic, per lb., 4d to 6d |
| Cauliflowers, p. doz., 6d to 3s | Artichokes, per doz., 4s to 6s |
| French Beans, p. h. sieve, 2s to 4s | Lettuce, Cab., p. score, 4d to 1s |
| Beans, per sieve, 1s 6d to 2s | — Cos, per score, 3d to 1s |
| Peas, per sieve, 1s 9d to 3s 6d | Small Salada, p. punn., 2d to 3d |
| Potatoes, per ton, 45s to 80s | Horse Radish, p. bundl., 1s 6d to 6s |
| — per cwt., 2s to 5s | Red Beet, per doz., 1s to 2s |
| — per bush., 1s 6d to 2s 6d | Mushrooms, p. pot., 1s 6d to 2s |
| Turnips, p. bunch, 2d to 4d | — per bushel, 7s to 10s |
| Cucumbers, each, 1d to 1s | Sorrel, per hf. sieve, 6d to 9d |
| Radishes, per doz., 9d to 1s 6d | Tomatoes, p. half sieve, 3s to 4s |
| — Turnip, p. doz., 1s to 1s 6d | Fennel, per bunch, 2d to 3d |
| Celery, p. bundle, 6d to 1s 6d | Savory, per bunch, 2d to 3d |
| Carrots, per bunch, 4d to 6d | Thyme, per bunch, 2d to 3d |

HOPS.—Friday, Oct. 17.

Messrs. Pattenden and Smith report that there is a good demand for both new and old Hops, at the previous currency. Duty, 120,000*l.* to 125,000*l.*

SMITHFIELD, Monday, Oct. 13.

We have rather a shorter supply of Beasts, but the demand having also decreased, we cannot quote trade better; indeed, for middling qualities scarcely so good; many of this kind remain unsold. There were a few more Sheep to-day, and trade is heavy, especially for big Long-wools. Good Calves are not plentiful, and maintain late prices with a ready sale. From Holland and Germany there are 1543 Beasts, 5090 Sheep, 170 Calves, and 109 Pigs; from Spain, 290 Sheep; from Scotland, 20 Beasts; and 2500 from the northern and midland counties.

| Per st. of 8 lbs.— | s | d | s | d |
|---|---|---|---|---|
| Best Scots, Herefords, &c. ... | 3 | 2 | to 3 | 4 |
| Best Short-horns | 3 | 0 | — 3 | 2 |
| 2d quality Beasts | 2 | 0 | — 2 | 6 |
| Best Downs and Half-breds ... | 3 | 8 | — 3 | 10 |
| Ditto Shorn ... ... | | | | |

| Per st. of 8 lbs.— | s | d | s | d |
|---|---|---|---|---|
| Best Long-wools . | 3 | 8 | to 3 | 6 |
| Ditto Shorn ... | | | ... | |
| Ewes & 2d quality | 2 | 8 | — 3 | 0 |
| Ditto Shorn ... | | | ... | |
| Lambs ... ... | 0 | 0 | — 0 | 0 |
| Calves ... ... | 3 | 0 | — 3 | 10 |
| Pigs ... ... | 3 | 0 | — 3 | 8 |

Beasts, 4604; Sheep and Lambs, 28,270; Calves, 230; Pigs, 580.

Friday, Oct. 17.

The number of Beasts to-day is very much smaller than it has been of late. The weather is also more favourable for slaughtering. In consequence, trade is brisk, at an advance of about 2d. per 8 lbs. The number of Sheep is small, and prices are generally higher. Choice Downs are scarce, and in a few instances exceed our top quotations. Good Calves are making rather more money. From Germany and Holland we have 166 Beasts, 890 Sheep, 170 Calves, and 23 Pigs; from Scotland, 15 Beasts; and 350 from the northern and midland counties.

| Best Scots, Herefords, &c. ... | 3 | 4 | to 3 | 6 |
|---|---|---|---|---|
| Best Short-horns | 3 | 2 | — 3 | 4 |
| 2d quality Beasts | 2 | 4 | — 2 | 8 |
| Best Downs and Half-breds ... | 3 | 8 | — 4 | 0 |
| Ditto Shorn ... ... | | | | |

| | | | | |
|---|---|---|---|---|
| Best Long-wools . | 3 | 4 | to 3 | 8 |
| Ditto Shorn ... | | | ... | |
| Ewes & 2d quality | 2 | 8 | — 3 | 2 |
| Ditto Shorn ... | | | ... | |
| Lambs ... ... | 0 | 0 | — 0 | 0 |
| Calves ... ... | 3 | 0 | — 3 | 10 |
| Pigs ... ... | 3 | 0 | — 4 | 0 |

Beasts, 720; Sheep and Lambs, 3920; Calves, 322; Pigs, 510.

MARK LANE.

Monday, Oct. 13.—There was little Wheat offering from Essex this morning, but a good show upon the Kent stands; the whole was disposed of at the prices of this day se'nnight; for foreign, a retail inquiry only was experienced, on the terms of last week. Floating cargoes of Polish Odessa are in request for Ireland and the Continent, but the transactions were not numerous.—Best descriptions of malting Barley sell readily at late prices; other sorts are neglected.—New white boiling Peas are 2s. per qr. dearer. In the value of other qualities, and of Beans, there is no alteration.—The trade for Oats is slow, and the price for new black Irish is 6d. per qr. cheaper.

| Per Imperial Quarter. | s. | s. | | s. | s. |

Friday, Oct. 17.—The arrivals of grain and Flour of all sorts this week have been moderate. This morning's market was thinly attended, and sales of Wheat from the stands were very limited, without alteration in prices, excepting for the lowest descriptions, which are taken for the Continent at gradually enhanced rates, say—common Ibraila at 20s. per qr., f. o. b., including freight and insurance; and Polish Odessa afloat at 32s. to 32s. 6d., also cost and freight. There is no alteration in the value of Barley, Beans, and Peas.—In Flour there is little passing.—Paris, Oct. 15: Flour continues difficult of disposal, although holders do not anticipate a further decline. Of Wheat the offers are small, farmers being busily engaged in sowing. In the interior, prices of Wheat have undergone no alteration.

Liverpool, Tuesday, Oct. 14.—The arrivals from Ireland and coastwise during the past week have been moderate of Oats and Oatmeal, but trifling of other articles. Owing to her Majesty's visit to this town and Manchester there was little or nothing doing during the latter part of the past week; however, where sales of Wheat or Flour were effected, a slight advance over Tuesday's currency was generally realised. In other articles, nothing worthy of remark has taken place. The weather has been for the most part stormy and wet. At this day's market there was a good attendance of the town and country trade, and, though the demand was not so brisk as was anticipated, still a fair business was done in Wheat and Flour at the full prices of last Tuesday. Oats and Oatmeal were in moderate request, at late rates. Barley, Beans, and Peas met with a good retail demand. Indian Corn was hardly inquired for, and buyers might have supplied themselves on more favourable terms.

HOUSE FURNISHING AND INTERIOR DECORATIVE ESTABLISHMENT, 451, OXFORD-STREET, LONDON.—Cabinet Furniture of every description at marked prices—Brussels Carpet, 2s 6d. per yard.—Damask Curtains, 10d. per yard and upwards; Ditto, in Silk and Worsted (French fabric), nearly two yards wide, at 8s. per yard.—The best Floor Cloths that can be made, cut to any dimensions. 2s. 3d. per yard. The largest Manufactory in London for Paper Hangings, English and French Decorations, adapted either to the Cottage or the Mansion, fitted up, showing the side of a room finished for occupation.

"FRIGI DOMO."—A Canvas, made of prepared Hair and Wool, a perfect non-conductor of Heat and adapted to many Horticultural and Floricultural purposes for covering over frames where a fixed temperature is required. It is 2¼ yards wide, and of any required length, at 1s. 4d. per yard run.—Manufactured only by E. T. ARCHER, Carpet Manufacturer, 451, New Oxford-street, London.

THE HAIR.—LOST AND RESTORED.—"Newport, Isle of Wight, Sept. 6, 1843.

"Gentlemen,—Some three months since, finding my hair falling off by nearly handsful, and my head approaching baldness; in fact, being quite bald at the crown and on the sides, I was induced, through my hairdresser, Mr. Beach, of this place, to try your BALM OF COLUMBIA, and after persevering with four bottles, according to your directions, I found a new crop produced, which has now restored my head to its former appearance. As I had apprehended a total loss of my hair, I feel it due to the virtues of your Balm of Columbia thus publicly to bear my testimony. Mr. Beach, who recommended me, is the same who used it successfully in Mr. Wilson's case, whose testimony you have lately published. Mr. B. is a Lymington man; I am also a native of that place, though for the last ten years in practice here as a solicitor.—Yours, &c. H. RICE.

"To Messrs. C. & A Oldridge."

For the strengthening of weak hair, its restoration when thinly scattered, or falling off and consequent general improvement and embellishment, the powers of OLDRIDGE'S BALM OF COLUMBIA are known by the continually increasing numbers who are testing its merits, as powerfully and unfailingly efficient.—Price 3s. 6d., 6s., and 11s. per bottle. No other prices are genuine. Ask for OLDRIDGE'S BALM, and never be persuaded to use any other article as a substitute.

13, Wellington-street North, seven doors north of the Strand.

THE GREAT EXHIBITION.—A valuable, newly invented, very small, powerful Waistcoat-pocket Glass, the size of a Walnut, to discern minute objects at a distance of from four or five miles, which is found to be invaluable at the Exhibition, and to SPORTSMEN, GENTLEMEN, and GAME-KEEPERS. TELESCOPES.—A new and most important INVENTION in TELESCOPES, possessing such extraordinary powers, that some, 3¼ inches, with an extra eye-piece, will show distinctly Jupiter's moons, Saturn's ring, and the double stars. They supersede every other kind, and are of all sizes—for the Waistcoat-pocket, Shooting, Military purposes, &c. Opera and Race-course Glasses, with wonderful powers; a minute object can be clearly seen, from 10 to 12 miles distant.—Invaluable newly-invented preserving Spectacles, invisible and all kinds of acoustic instruments for relief of extreme deafness. Messrs. S. and B. SOLOMONS, Opticians and Aurists, 39, Albemarle-street, Piccadilly, opposite the York Hotel, London.

CUNDY'S PATENT PRIZE STOVE.—W. HODGES, 123, Oxford-street (late J. E. Dowson), is the sole manufacturer of CUNDY'S patent open fire-place, pure warm air ventilating STOVE, which has been so long tested and approved by the public, and for which he received the large Silver Medal from the Society of Arts. It is admirably adapted for warming and ventilating churches, school rooms, and other public places, halls, dining-rooms, &c., &c. Also CUNDY'S Patent Dioko-Capnon or smoke-expelling register Grate, a perfect cure for smoky chimneys; together with a large assortment of Marble Chimney-Pieces, Drawing-room and other Grates, Fenders, Fire-irons, and Kitchen Ranges of the most improved principle, Wind-guards, &c.

THE TEETH AND BREATH.—A good set of Teeth ever insures favourable impressions, while their preservation is of the utmost importance to every individual, both as regards the general health by the proper mastication of food, and the consequent possession of pure and sweet breath. Among the various preparations offered for the purpose, ROWLAND'S ODONTO, or PEARL DENTIFRICE, stands unrivalled in its capability of embellishing, purifying, and preserving the Teeth to the latest period of life. It will be found to eradicate all tartar and concretions, and impart a pearl-like whiteness to the enamelled surface, remove spots of incipient decay, render the gums firm and red, and thus fix the Teeth firmly in their sockets; and from its aromatic influence impart sweetness and purity to the breath. Price 2s. 9d. per box. Beware of spurious imitations. The genuine article has the words, "A. ROWLAND and SONS, 20, Hatton Garden," engraved on the Government stamp affixed on each.—Sold by them, and by Chemists and Perfumers.

ZOOLOGICAL GARDENS, REGENT'S PARK.—The URAN UTAN, presented by the Governor of Singapore, is exhibited daily, together with the ELEPHANT CALF, and the HIPPOPOTAMUS, presented by H. H. the Viceroy of Egypt. Admission, 1s. On MONDAYS, 6d.

MEDICINE ALWAYS AGGRAVATES DISEASES, BUT DU BARRY'S FOOD INVARIABLY CURES THEM; indeed, fifty thousand cures have been effected by DU BARRY'S delicious REVALENTA ARABICA FOOD, without medicine, inconvenience, or expense (as it saves 50 times its cost in other remedies). Cure No. 71, of dyspepsia: from the Right Hon. the Lord Stuart de Decies:—"I have derived considerable benefit from DU BARRY'S Revalenta Arabica Food, and consider it due to yourselves and the public to authorise the publication of these lines.—Stuart de Decies." Cure 49,832: "Fifty years' indescribable agony from dyspepsia, nervousness, asthma, cough, constipation, flatulency, spasms, sickness at the stomach, and vomitings, have been removed by DU BARRY'S excellent food.—Maria Jolly Wortham, Ling, near Diss, Norfolk." Cure No. 180: "Twenty-five years' nervousness, constipation, indigestion, and debility, from which I had suffered great misery, and which no medicine could remove or relieve, have been effectually cured by DU BARRY'S Revalenta Arabica Food in a very short time.—W. R. Reeves, Pool Anthony, Tiverton." Cure No. 4208: "Eight years' dyspepsia, nervousness, debility, with cramps, spasms, and nausea, for which my servant had consulted the advice of many, have been effectually removed by DU BARRY'S delicious health-restoring food in a very short time. I shall be happy to answer any inquiries.—Rev. John W. Flavell, Ridlington Rectory, Norfolk." Cure No. 1609: "Three years' excessive nervousness, with pains in my neck and left arm, and general debility, which rendered my life very miserable, has been radically removed by DU BARRY'S health-restoring food.—Alex. Stuart, Archdeacon of Ross, Skibbereen." Copies of testimonials of 50,000 cures (including those of Major-General Thomas King, Drs. Ure, Shorland, and Harvey), may be had gratis. In London are agents—FORTNUM, MASON, and Co., 181 Piccadilly, Purveyors to her Majesty the Queen; also to be had at 60, Gracechurch-street; 330 and 451, Strand. In canisters, with full instructions, 1 lb., 2s. 9d.; 2 lbs., 4s 6d.; 5 lbs., 11s.; 12 lbs., 22s. Super-refined, 5 lbs., 22s.; 10 lbs., 33s. The 10 lbs. and 12 lbs carriage free. DU BARRY and Co., 127, New Bond-street, London.
